The Hudson switching station, designed and constructed by the Public Service Production Company, is somewhat similar in design to the Trenton and Athenia stations, respectively placed in operation about four months and twelve months previously. Four 15,000-kva., single-phase self-cooled transformers, one a spare, are installed for stepping down the voltage to 26.4 kv. for distribution of power to the Hudson and Bergen divisions of the operating company. All of the primary disconnecting switches necessary for the operation of the bank of transformers in the initial installation are motor-operated, as are the secondary transfer-bus switches, the switches of both voltages being the first in the Public Service system to place dependence upon high pressure rather than large area of contacts. Outdoor 26.4-kv. reactors are employed in the bus layout and represent the first installation on the company's lines of oil-immersed reactors. Owing to the switching station's proximity to the three large generating stations of the system, no provision has been made for the future installation of synchronous condensers on the tertiary windings of the main transformers.

Additional sources of power to the switching station are furnished by connections at 26.4 kv. from two 11,500-kva., three-phase transformers adjacent to the Marion station. At the switching-station end of these lines 26.4-kv. tap-changing voltage regulators are installed to facilitate handling of the three-cornered condition, viz., the step-up to 132 kv. from 13.2 kv. at the Marion generating station, the step-down from 132 kv. to 26.4 kv. at the Hudson switching station, and the step-up from 13.2 kv. to 26.4 kv. at Marion.

The actual construction of the switching station presented several unusual problems. The entire foundations are supported on piling, it having been necessary in some instances to drive a number of piles in close proximity in order to obtain sufficient support in the marshy soil. The presence of surface water made necessary the continuous operation of pumps and the temporary erection of earth dikes at certain edges of the property. Nevertheless, the date of the station's completion followed the date of ground breaking by only about seven months. A feature is the installation of a kenotron set for the testing of cable up to a direct-current voltage of 150 kv.

# Briefer News

Upstate New York Utility Changes Name.—The Depew & Lancaster (N. Y.) Light, Power & Conduit Company has filed a certificate changing its corporate name to the Western New York Gas & Electric Corporation.

Additional 4,000-Hp. Generator for Government Plant at Guernsey, Wyo.—A second 4,000-hp. generating unit was installed recently at the government's irrigation and power plant at Guernsey, Wyo., thus doubling its capacity. Enough water for two more such units is reported to be available at this site.

Georgia Power Company's Enlarged Headquarters. — Reconstruction of the office building of the Georgia Power Company in Atlanta by the addition of three floors and by improvements in the Walton Street annex, at a cost of $500,000, has recently been completed and gives the company 33,000 sq.ft. of floor space and modern quarters for its business offices and its display rooms.

New Interstate Line Authorized for New Hampshire Company.—The Southern New Hampshire Hydro-Electric Company has received permission from the New Hampshire Public Service Commission to build a transmission line from Canaan, Vt., through Stewartstown, Colebrook, Columbia, Northumberland and Stratford to Lancaster, N. H. Work will be begun as soon as conditions are favorable.

Hydro Plant to Be Built to Serve Oregon Mines.—Coming construction by Eastern capital of a hydro-electric system on Blue River, 45 miles east of the city of Eugene, Ore., has been announced by J. S. Miller, owner of mining properties in the district, who says that the energy generated will be used for the operation of a railway from Eugene to the mining property and also in the operation of mining machinery.

Progress of Northern States Power Company.—Present indications are that the Northern States Power Company's 30,000-hp. hydro-electric station at Chippewa Falls, Wis., which is to operate synchronously with the 42,000-hp. Wissota hydro-electric station, 3 miles further up the Chippewa River, will be completed by September in accordance with the plans. The Northern States company has just replaced the steam ends of two 1,500-kw. turbine units in its steam plant at Fargo, N. D., with new equipment, thereby increasing their rating to 2,250 kw. each. Additional generating capacity at Grand Forks and Minot, N. D., has also been authorized, and plans have been approved for the construction of the 84-mile transmission line from Green Bay to Stevens Point, Wis., which is to interconnect the systems of the Wisconsin Public Service Corporation and the Wisconsin Valley Electric Company. This line will be of H-frame, wooden-pole construction and will operate at 110,000 volts. It will involve substation equipment at each end and will cost about $1,500,000.

Northwest Commercial Men to Meet in Portland on Feb. 20-21.—A meeting of the executive committee of the Commercial Section, Northwest Electric Light and Power Association, set the time for the midwinter meeting of the section as Feb. 20 and 21. Portland, Ore., will be the place. Reports of committees showed activity in the promotion of commercial cooking, merchandising, industrial heating, rural service, street and highway lighting and home and industrial illumination. Ten talks before business men's lighting clubs have been made already, out of thirty scheduled.

International Water Commission to Meet at El Paso and Juarez This Month.—The first joint meeting of the Mexican and American sections of the International Water Commission has been called to convene at El Paso, Tex., and Juarez, Mexico, on Feb. 27, the chairman of the American section of the commission, Dr. Elwood Mead, announces. The American commissioners appointed by the President are, as previously announced, Dr. Mead, Gen. Lansing H. Beach and W. E. Anderson. Miss M. A. Schnurr is secretary of the American section.

Oklahoma-Kansas Interconnection. — The Empire District Electric Company is making rapid progress on construction of a frequency changer and turbine room at its Riverton (Kan.) steam plant. This is a part of a construction program which is expected by late spring of this year to involve an expenditure of approximately $1,100,000 and to bring transmission-line connections between the Riverton plant and the Neosho River plant of the Kansas Gas & Electric Company, southwest of Pittsburg, Kan. It will give all the Oklahoma towns on the lines of the company direct connection with these two Kansas power-generating plants.

South Georgia Rate Reductions.—The Georgia Public Service Commission has followed the investigation previously reported by ordering substantial rate reductions in all cities and towns in the state served by the Georgia Power & Light Company, which supplies Valdosta, Waycross, Bainbridge and other cities in south

Georgia. In the three cities named the new rates for residential and commercial lighting range from 11 cents for the first 40 kw.-hr. per month down to 5 cents for consumption over 1,000 kw.-hr. In Blackshear, Boston, Jessup, Waynesboro and other towns the new rates range from 12 cents to 6 cents. Rates for industrial service were also reduced in nearly every community served.

Arizona Power Company Makes Five-Year Contract with United Verde Copper Company.—Negotiations have just been concluded whereby the Arizona Power Company contracts to supply the United Verde Copper Company with its power requirements for five years from Oct. 1 last, according to B. M. Wotkyns, director of the Arizona company. The contract assures Arizona Power of a large and steady load from this one source. Another advantage accruing to the power company is that it is enabled to buy waste-heat power from the copper company on good terms for use during peak conditions. The copper company operates a large concentrating mill and copper smelter in connection with its mine.

Electric Department Budget of New Jersey Public Service Calls for $22,000,000.—Budgets for 1928 of the operating companies of the Public Service Corporation of New Jersey representing a total of approximately $37,000,000 have been approved. Of this sum more than $22,000,000 will be used by the electric department of the Public Service Electric & Gas Company, $7,000,000 being appropriated for interconnection and transmission projects, half of which is for the tri-company agreement to which the Pennsylvania Power & Light and the Philadelphia Electric are the other parties. The 40-acre Roseland switching station will cost between $5,000,000 and $6,000,000, and $700,000 is to be spent on a spare bank of transformers, consisting of three 15,000-kva. units, and other equipment at Kearny.

Two Nebraska Companies Will Push Rural Service Even at Loss.—The Nebraska Power Company has provided in its 1928 budget more than a million dollars for reconstruction and extensions. A considerable portion of this will be expended in rural electrification, the company having just obtained authority from the State Railway Commission to construct a dozen transmission lines in the well-settled counties surrounding Omaha, where its plant is situated. In this section the company has bought a number of municipal plants, and it will make these the center of farm operations. A complete circuit will enable the routing of energy in either one of two directions. The company is offering to supply all equipment needed to reach each farmer, the service charge to be a sum equal to the interest on the investment plus the upkeep cost, after which electricity will be supplied at rates close to those prevailing in the cities. The Iowa-Nebraska Light & Power Company is planning developments along the same lines. Both companies are said to be prepared to lose some money in making the experiment, if necessary.

N. E. M. A. Policies Division Meeting. — Business practices and business getting will be major subjects of discussion at the March 14-16 meeting of the Policies Division, National Electrical Manufacturers' Association, according to announcement by Vice-president Clarence L. Collens. The meeting will be held at the Edgewater Beach Hotel, Chicago. A meeting of the board of governors, at which President Gerard Swope will preside, is scheduled for Wednesday evening, March 14.

New International Company to Serve Both Sides of the Rio Grande.—Another utility company has been organized on the Lower Rio Grande border for the purpose of doing an international business. It is the Hidalgo Utilities Company and has a capital stock of $100,000. It will construct an electric power plant at Hidalgo and has obtained a concession from the Mexican government to build a wooden-pole transmission line to Reynosa, Mexico, and other towns in the State of Tamaulipas. The company will also serve Hidalgo and other towns on the American side of the river. A. Y. Baker of Edinburg, Tex., has been elected president.

## *Coming Meetings*

[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for Jan. 7, page 80.]

American Institute of Electrical Engineers — Winter convention, New York, Feb. 13-16; St. Louis regional meeting, March 7-9; Baltimore regional meeting, April 17-19. F. L. Hutchinson, 33 West 39th St., New York.

Rocky Mountain Division, N.E.L.A.—Albuquerque, N. M., Feb. 14-16. O. A. Weller, 900 15th St., Denver.

Midwest Power Conference — Hotel Stevens, Chicago, Feb. 14-17. G. E. Pfisterer, 53 West Jackson Blvd., Chicago.

Iowa Power Conference—University of Iowa, Iowa City, Feb. 15 and 16. Joe Carmichael, Iowa Committee on Public Utility Information, 310 Crocker Bldg., Des Moines.

Northwest Electric Light and Power Association — Commercial Section, Portland, Ore., Feb. 20 and 21; Engineering Section, Spokane, Wash., March 8 and 9. Berkeley Snow, 1208 Spalding Building, Portland, Ore.

New Mexico Utilities Association—Albuquerque, N. M., Feb. 20-22. Arthur Prager, Albuquerque Gas & Electric Company, Albuquerque.

Oklahoma Utilities Association—Mayo Hotel, Tulsa, March 13-15. E. F. McKay, 1020 Petroleum Bldg., Oklahoma City.

Illinois State Electric Association—Hotel Abraham Lincoln, March 14-15. R. V. Prather, 205 Illinois Mine Workers' Bldg., Springfield, Ill.

National Electrical Manufacturers' Association—Policies Division, Edgewater Beach Hotel, Chicago, March 14-16. S. N. Clarkson, 420 Lexington Ave., New York.

International Association of Electrical Inspectors—Madison, Wis., March 17-18. W. Wilke, 4211 Eiring Place, Milwaukee.

Maryland Utilities Association—Emerson Hotel, Baltimore, March 23. G. S. Williams, 1005 Continental Bldg., Baltimore.

Southwestern Division, N.E.L.A. — Edgewater Gulf Hotel, Biloxi, Miss., April 3-5. S. J. Ballinger, San Antonio Public Service Company, San Antonio, Tex.

Uvalde, Tex., Becomes Strategic Point in Electric Service.—Uvalde, Tex., will soon be the hub of a transmission network connecting it with the Winter Garden district on the south, with San Antonio on the east and, from Del Rio, with the extensive system of high-tension lines in west Texas. Lines from the San Antonio Public Service Company and the West Texas Utilities Company will join the Central Power & Light Company's system at Uvalde, where the Central Power & Light Company is building a large substation. That company expects that a 132-kv. trunk line will be necessary eventually, into which the 66,000-volt system now under construction can be tied. Uvalde will be power headquarters for the Winter Garden district, the company says.

Cleveland Electric Illuminating's Big 1928 Budget.—Announcement that the Cleveland Electric Illuminating Company would spend $9,800,000 in 1928 on additional facilities for providing the Greater Cleveland district with electric service was made at the recent annual meeting of stockholders. This is nearly $2,600,000 in excess of the sum similarly expended in 1927. Construction will include the installation of a 35,000-kw. turbo-generator with boilers and auxiliary equipment at Avon station, as already announced; a 132-kv. steel-tower transmission line to connect Avon station with Clinton substation, the million-dollar structure at West Ninety-fifth Street completed a year ago, and additions to that substation and to twenty others, besides additional underground lines and distribution lines.

Large Attendance at San Francisco Engineering Meetings.—An unusually large attendance and keen interest in committee work featured the midwinter meeting of the Engineering Section of the Pacific Coast Electrical Association held in San Francisco, Jan. 11-12. At a luncheon meeting attended by 180 P. M. Downing, vice-president of the association, said that the ideal toward which the Engineering Section should work is to obtain the greatest possible number of kilowatt-hours per dollar of invested capital. Individual committee meetings were unusually well attended and all committees reported a most active year. An innovation was joint meetings of each committee with the accident prevention committee. In this way the latter committee was able to arouse the interest of all committee members in accident prevention work, and through the presentation of papers on safety practice and methods and training of personnel many valuable ideas were brought out.

Another Unit for McCamey, Tex.—Another unit for the power plant of the Pecos Valley Power & Light Company, 10 miles west of McCamey, Tex., is under construction. It will have a capacity of 8,000 hp. and will bring the total rating of the plant to 24,000 hp. Power from this plant goes to the oil fields of west Texas as well as to towns which are within a radius of more than 100 miles.

Ohio Power Company's Biggest Unit to Go in at Philo This Year.—The Ohio Power Company has now 350 men at work on the construction of its 165,000-kw. unit at Philo. Thirty-four concrete caissons have been sunk to rock, 52 ft. below ground level. These caissons vary from 8 ft. to 22 ft. in diameter. All the steel columns for the superstructure will be supported by these caissons. Field work to date indicates that the new turbine will be ready to take the line load before the end of the year—perhaps by Nov. 1.

Back River Power Company Lets Construction Contracts in Quebec Province.—Several contracts have been awarded on the power development of the Back River Power Company near Montreal, a project which will involve a total expenditure of $8,000,000. The operating company is to be the Montreal Island Power Company, Ltd., incorporated in 1927. This company has a contract with Montreal Light, Heat & Power Consolidated under which the latter will purchase all the power for a period of 30 years, with opportunity of renewal for 30 years more. The site is capable of developing 65,000 hp. under a 26-ft. head, and it is expected that the initial 40,000 hp. will be available for delivery by the end of 1929. The power plant will consist of a number of units of 7,500 hp. each. Eventual installation may reach 92,000 hp.

Los Angeles Rivals Both to Cut Rates Again.—The Bureau of Power and Light of Los Angeles has been authorized by a resolution passed by the Board of Water and Power Commissioners to reduce its present rates for electricity approximately 10 per cent. The reductions are to be put into effect beginning July 1 of this year, when the lighting rate will be reduced from 5 cents to 4.5 cents per kilowatt-hour and the maximum power rate from 4.5 cents to 4 cents. Last July the bureau cut its lighting rate from 5.6 cents to 5 cents and its maximum power rate from 5 cents to 4.5 cents. Coincident with the announcement of the reduced rates on the part of the municipal department, Addison B. Day, executive vice-president and general manager of the Los Angeles Gas & Electric Corporation, announced that his organization would make a similar move.

# Recent Court Decisions

Commission Cannot Prohibit Utility from Keeping Second Set of Fixed-Capital Accounts in Its Own Way.—While the New Jersey Board of Public Utility Commissioners could order the Passaic Consolidated Water Company to keep its fixed-capital accounts in a way approved by the commission, it could not forbid the company to keep in addition another set in which its own desires could be followed, said the Supreme Court of New Jersey in deciding for the plaintiff in a suit brought by the water company against the commission. (139 At. 324.)*

Commissions Must Be Governed by Principles of Common Law.—"It is elementary," declared the Appellate Court of Indiana in reversing a verdict for damages (Puckett vs. Terre Haute, Indianapolis & Eastern Traction Company), in which the headlighting equipment of an interurban car as prescribed by the Public Service Commission was concerned, "that boards and commissions in exercising power conferred upon them by statute must be governed by the rules and principles of common law. These rules and principles require that such power shall always be exercised in a reasonable manner. If not so exercised, any rule, order or ordinance contrary thereto will be by the courts declared void." (158 N.E. 639.)

Entry of Occupied Field Permitted in North Dakota. — M. A. Erickson of Rugby, N. D., has won in the Supreme Court of that state the suit brought against him to halt the construction of a power plant at Kenmare (Electrical World, Dec. 3, page 1168) and has announced that he will proceed with the building early next spring. The State Railroad Commission held that Erickson should be enjoined from constructing the plant since he had not obtained a certificate of convenience and necessity as required by the 1927 law, which became effective on July 1. Erickson maintained that since he obtained a franchise from the city of Kenmare on June 6 the law did not apply. Erickson will now institute court action to halt the Montana-Dakota Power Company, now furnishing electrical service at Kenmare, from further operations in that city.

Jacksonville's Right to Wire Domestic Electric Equipment Again Sustained.—The Circuit Court at Jacksonville, Fla., has handed down a decision to the effect that the city has the proprietary right to engage in the business of making wiring connections and installations for electric stoves and other equipment. Suit was brought several months ago (Electrical World, Oct. 8, page 756) by Edward Hamler, a taxpayer, to restrain the city from doing such work, the plaintiff contending that the city was stepping outside its province in doing the wiring work and that the work was being done at less than cost on the theory that the city would profit through the increased use of electricity. It was also contended that electrical dealers were being injured and that the interests of the public were jeopardized because any losses sustained by the city would have to be paid from public funds. Application for a temporary injunction was denied last November, and the sustaining of the demurrer settles the case as far as the Circuit Court is concerned.

Private Company Barred from Supplying Alternating-Current Energy in City with Municipal Direct-Current Supply. — Decision for the town of Ackley, Iowa, in a suit to uphold a temporary injunction procured by the town to halt the Central States Electric Company's installation of wires through Ackley to reach a creamery desirous of alternating-current service has been given in the Iowa Supreme Court. The manager of the creamery claimed that the direct-current service of the municipal plant was unsuitable to his needs and contracted with the Central States company, from which the town, which is to change over to alternating service, will now seek damages.

# Commission Rulings

Profit by Construction Company in Sale of Its Product to Allied Utility Company Condemned. — The California Railroad Commission has laid down the principle that it will not permit a corporation owning all of the stock of a public utility under its jurisdiction to exact a profit at the expense of the public utility and to capitalize such profit in securities issued by authority of the Railroad Commission. The commission took this action in a supplemental order on the application of the Pickwick Stages System for authority to use the proceeds from the sale of stock and certificates issued by it to buy rolling stock owned by the Pickwick Corporation, a company which owns all of the outstanding stock of Pickwick Stages System, the operating utility. It was brought out that the Pickwick Corporation proposed to charge a profit on the equipment constructed for its own use in the amount of $8,910. In passing upon the application the commission said: "We do not look with favor on the practice of permitting a construction company to profit at the expense of a public utility when the construction company controls the public utility or is owned or controlled by the same interests which own or control the utility."

Unused Property in Valuation.—The rate base of the Lakewood Water Company has been modified on rehearing by the New Jersey Board of Public Utility Commissioners, which sustained a contention that in making deductions for property not used and useful the amount deducted had been only the basic figures representing values of the items in question and that additions for intangibles such as "going concern" value had not also been deducted. On the other hand, the commission refused to sustain a contention that part of a building used jointly by several companies as a shop for the maintenance and repair of gas, electric and water meters should be omitted from the rate base because the water company involved did not own the building. Likewise, the commission refused to exclude from the rate base an amount representing the value of excess land not used by the company and not easily salable, but necessarily acquired with other land which was necessary for the right-of-way.

# News About Men of the Industry

## *Drexler Acting Manager of Virginia Utility*

Norman E. Drexler, since 1916 chief engineer of the Newport News & Hampton Railway, Gas & Electric Company, now the Virginia Public Service Company, has been named acting manager of that utility to supervise the work formerly directed by C. D. Porter, who has transferred his interests to Omaha.

Mr. Drexler became assistant engineer of the Newport News company in 1912 and after serving in that capacity for two years he was made master mechanic and subsequently assistant superintendent of transportation. It was in 1916 that he was appointed chief engineer. As announced in the Jan. 28 issue of ELECTRICAL WORLD, Mr. Porter, vice-president and general manager of the Virginia Public Service Company, resigned to become vice-president and general manager of the Omaha & Council Bluffs Street Railway Company.

---

E. N. HENRY, assistant superintendent of the northern division of the Alabama Power Company, Huntsville, has been transferred to Demopolis in the capacity of district superintendent.

FRANK TIBBALS has been elected secretary and treasurer of the Westfield Power Company, Westfield, Mass. Mr. Tibbals is also a member of the board of directors.

H. T. ASBURY, manager of the McAlester division of the Southwest Power Company, has been transferred to Fayetteville, Ark., where he will have charge of the Fayetteville division.

J. E. EVERSON, formerly electrical engineer of the Sioux City (Iowa) Gas & Electric Company, has been promoted to the position of general superintendent with general supervision of electric and gas production and distribution.

B. E. WALTZ, vice-president of the United Public Service Company of Chicago, will leave that city this month to take active charge of the Kentucky Power Company's plants recently acquired by the United Public Service Company.

W. L. CARR has been appointed supervisor of electric metering for the New York Power & Light Corporation, Albany. Mr. Carr's new duties will include the selection of types of electric meters, installation methods and testing.

OLIVER A. CHURCH has been appointed district manager of the Batavia (N. Y.) district of the Niagara, Lockport & Ontario Power Company and GLENN W. IDE has been named district manager at Medina. Mr. Church was formerly construction superintendent at Batavia. His promotion follows the company's change in name from the Western New York Utilities Company to the Niagara, Lockport & Ontario Power Company. He is replacing H. K. Stein, formerly district manager at Batavia, who recently resigned.

WILLIAM FOSTER has been appointed general superintendent of aerial and underground construction of the Philadelphia Electric Company.

OWEN D. YOUNG, chairman of the board of directors of the General Electric Company, was elected a member of the board of managers of the State Charities Aid Association at a meeting held at the Bankers' Club, New York, Jan. 31.

WILLIAM C. HORNBERGER of Phoenix, Ariz., has been elected vice-president and general manager of the Arizona Edison Company, a subsidiary of the Peoples Light & Power Corporation. Mr. Hornberger was for several years assistant general manager of the Central Arizona Light & Power Company, controlled by the Electric Bond & Share Company.

DR. THOMAS H. MCLAUGHLIN, director of electrical supply of the Irish Free State, arrived in New York Jan. 25 aboard the Cunard liner *Aquitania*. Dr. McLaughlin is in the United States to study plant construction and operation methods of the American electrical industry. The construction of the hydro-electric developments on the Shannon River has been under the supervision of Dr. McLaughlin.

ROY COSBEY has been elected secretary and a director of the Wadsworth Electric Manufacturing Company to fill the vacancy created by the death of Richard J. Dibowski. For the past four years Mr. Cosbey has been the comptroller of this company and was previously connected with the Joslin-Schmidt Company, the Cincinnati Milling Machine Company, the Modern Foundry Company, and Ernst & Ernst, all of Cincinnati, Ohio.

WILLIAM C. L. EGLIN, vice-president and chief engineer of the Philadelphia Electric Company, is seriously ill. Mr. Eglin was on a cruise in the Caribbean Sea when he was stricken. He was transferred at Havana to a northbound steamer and on reaching Philadelphia was removed at once to the Jefferson Hospital in that city. Eminent specialists as well as the physicians of the Philadelphia Electric Company were called in consultation. Mr. Eglin is suffering from "sleeping sickness" and while the physicians hold out some hope for his recovery, they do not deny the seriousness of the case.

GEORGE C. HEISTERMAN, formerly assistant industrial development engineer of the Public Service Company of Northern Illinois, has been appointed industrial development engineer for that company. A graduate of the University of Iowa, Mr. Heisterman became associated with the company in 1924 as an assistant power salesman. In 1925 he became a power salesman and one year later assistant industrial development engineer.

WILLIAM J. CASEY, president of the Continental Trust Company, Baltimore, has been elected a member of the board of directors of the Consolidated Gas, Electric Light & Power Company of Baltimore. Mr. Casey is succeeding the late S. Davies Warfield on both the directorate and executive committee of the Consolidated company as he also did in the presidency of the Continental Trust Company. He recently was elected a director of the Washington, Baltimore & Annapolis Electric Railroad.

BARON JEAN DANIEL DE MONTENACH of Geneva arrived in New York Feb. 1 aboard the White Star liner Olympic. The baron will spend a month in the United States, acquainting himself with American methods of power development. He will study particularly the properties of the Virginia Electric & Power Company, formerly the Virginia Railway & Power Company, which the Engineers' Public Service Company purchased from Frank Jay Gould, whose daughter Helen he married. Baron de Montenach is a director in many French enterprises.

## Obituary

ROBERT W. MUNK, production manager of the Crouse-Hinds Company, electrical manufacturer of Syracuse, N. Y., died Jan. 17 in that city after a short illness. Mr. Munk was 53 years of age.

LEON J. KENNEY, manager of the merchandising department of the Bristol (R. I.) Electric Company, died on Jan. 13. The Bristol company is affiliated with the Narragansett Electric Company, Providence.

RUDOLF V. ROSE, engineer and superintendent for the Empire Builders' Supply Company, Niagara Falls, N. Y., died Jan. 26 after a week's illness. A graduate of the Stevens Institute of Hoboken, Mr. Rose had formerly been connected with the Niagara Falls Power Company for more than twenty years. Starting in the capacity of draftsman, he later became chief draftsman and then assistant engineer. From 1907 to 1918 he served as construction engineer for the Niagara Falls Power Company, the Canadian Niagara Power Company and the Niagara Junction Railway Company. In 1920 he became president of the Consolidated Fuel & Supply Corporation, Niagara Falls, and four years later affiliated himself with the Empire Builders' Supply Company. Mr. Rose was 52 years of age.

# Financial and Statistical News

## *Stocks Move Upward Money Rate at 4½ Per Cent Bond Market Firm*

FOLLOWING the irregularity occasioned last week by the rise to 4 per cent in the Chicago rediscount rate, the market became firm and before the week closed the trend moved toward higher levels, with the utilities leading the upswing. Activity continued during the sessions this week and the utilities absorbed the bulk of interest. In fact, the utility group provided a background of strength for the market in general. Montana Power was the leader, advancing thirty-eight points in the course of a week. Brooklyn Edison advanced ten points during the week, while National Power & Light, Columbia Gas & Electric and Standard Gas & Electric made substantial gains. Other public utilities which continued in demand were Public Service Corporation of New Jersey, Pacific Gas & Electric, Southern California Edison and the Philadelphia Company.

The bond market was firm on the whole, wide fluctuations in prices being lacking. A feature of the week was the reduction from 5 to 4½ per cent in the call money rate.

## Twelve-Million-Dollar Italian Loan Floated

First mortgage 6½ per cent sinking fund gold bonds, series A, of Terni-Società per l'Industria e l'Elettricità were offered the investing public Jan. 30 at 90½ and interest, to yield about 7.35 per cent, a piece of financing involving a total of $12,000,000. Terni-Società per l'Industria e l'Elettricità, or "Terni" as it is known throughout Europe, was organized in 1884. The properties now in operation include four hydro-electric power stations located in the Apennine Mountains about 60 miles northeast of Rome, having a combined generating capacity of 86,200 kw. The company is building a new hydro-electric plant with an initial generating capacity of 105,000 kw., and in addition a subsidiary company, Società Elettrica dell 'Alto Nera, has under construction a plant with an initial generating capacity of 9,000 kw. These bonds will be a direct obligation of Terni-Società per l'Industria e l'Elettricità.

## National Power & Light Increases Dividend Rate

Directors of the National Power & Light Company at the same meeting at which they voted to give in exchange one share of common stock of National Power & Light Company for each share of Lehigh Power Securities Corporation common stock also voted to increase the regular quarterly dividend rate on National Power & Light Company common stock for the payment due June 1, 1928, from 20 cents a share to 25 cents a share. The regular quarterly dividend of 20 cents payable March 1 was declared Jan. 19 and will be payable to stock of record Feb. 14. No dividend has ever been paid on Lehigh Power Securities Corporation common stock. Subject to the plan becoming operative, holders of Lehigh Power Securities Corporation stock who make the exchange for National Power & Light Company common stock on or before Feb. 14 will receive a dividend on March 1 of 20 cents a share and thereafter the regular quarterly dividend of 25 cents a share.

## American Power & Light to Increase Capital

The American Power & Light Company, which in the near future is planning to acquire the Washington Water Power Company, as announced in the Jan. 21 issue of ELECTRICAL WORLD, has announced plans to increase its authorized preferred stock from 500,000 to 2,000,000 and the authorized common from 2,300,000 to 4,000,000 shares. The stockholders of the company have been notified of a meeting to be held Feb. 4, at which time the proposals will be submitted for approval. Common stock will be issued for expansion purposes.

## Detroit Edison Revenue Increased 5.6 Per Cent in 1927

### Statement Reflects Industrial Slackening, but Company Is Now in Position Where It Is Little Affected by Ups and Downs of Motor Industries

WITH the publication of Detroit Edison's financial statement for 1927, the first to be received this year by ELECTRICAL WORLD, the annual report period of the year again commences. The publication of these reports of 1927 activities is a matter of very considerable interest in the industry. Previous estimates can now be verified and a clear picture of what 1927 meant in the power and light industry can be secured.

Detroit Edison's report reflects the result of conditions existing in several industrial sections of the country and may be regarded as fairly representative of the large operating units serving industrial areas. Gross revenue increased only 5.6 per cent and net 3.6 per cent, which is considerably below the average rate of annual increase. This was due to relatively quiet conditions in certain large Detroit industries during all but the last few weeks of the year. Industrial slackening has been reflected in other branches of industry, and according to the statement the effect upon the power and light business was exactly that which has been observed in similar periods in the past. The usual compensatory causes, however, were operative in that the use of current by the average consumer is increasing. Furthermore, large industrial consumers increase their power purchases by nearly 3 per cent. It is intimated that the company has now reached a point where it will not be greatly affected by the ups and downs of a single industry, such as the automobile industry.

Examination of the earning statement of the company shows net income of $10,492,716 after depreciation, interest and federal taxes, which is equivalent to $11.32 a share on the common. This is exactly the same amount that was earned on common during the previous year. The operating ratio fell slightly, to 55.3 per cent. The average fuel required in 1927 by all the street power plants was only 1⅓ lb. of coal for each kilowatt-hour of energy generated.

| | For the Year 1927 | | For the Year 1926 | |
|---|---|---|---|---|
| Gross earnings from all operations: | | | | |
| Electricity | $44,759,413.36 | | $41,989,942.98 | |
| Steam | 2,223,656.44 | | 2,459,046.62 | |
| Gas | 305,992.89 | | 287,227.16 | |
| Miscellaneous | 90,716.01 | | 118,518.68 | |
| | | $47,379,778.70 | | $44,854,735.44 |
| Expense of all operations, including maintenance | $21,619,975.03 | | $21,310,959.02 | |
| Retirement reserve (depreciation) | 5,950,000.00 | | 5,500,000.00 | |
| Federal income and other taxes | 4,586,000.00 | | 4,049,600.00 | |
| | | $32,155,975.03 | | $30,860,559.02 |
| Balance, being net earnings from all operations | | $15,223,803.67 | | $13,994;176.42 |
| Interest on funded debt | $4,888,716.56 | | $4,200,021.14 | |
| Interest on unfunded debt | 307,967.37 | | 101,470.06 | |
| | $5,196,683.93 | | $4,301,491.20 | |
| Less amount charged to property account for interest on money borrowed for construction purposes | 465,596.29 | | 439,330.33 | |
| | | $4,731,087.64 | | $3,862,160.87 |
| Net income | | $10,492,716.03 | | $10,132,015.55 |

It is also noted that sale of electric energy to private consumers was by far the largest item. Sales to other public utilities were relatively small. The output of current was 2,142,549,100 kw.-hr., against 2,025,063,700 kw.-hr. in 1926. Kilowatt-hours actually sold were 1,811,100,684, against 1,709,656,328 the year before. The reduction in the service rate which was made in 1926 brought the 1927 average price for this class of service down to 4.7 per cent per kilowatt-hour. This price includes current, lamp renewals and servicing. The average of the supply to domestic consumers was 544 kw.-hr. In 1920 the figure was 415 and in 1923 it was 460.

The income account of the company and subsidiary utility companies for 1927 and for the previous year is as shown on the preceding page.

**NEW ENGLAND POWER BONDS TOTAL $12,223,000.**—In an article entitled "New England Power to Issue New Stocks" appearing on page 124 of the Jan. 14 issue of ELECTRICAL WORLD, the face value of the bonds of the New England Power Company outstanding was quoted at $2,223,000. This figure should have been $12,223,000.

# An Investor's View of Utility Investigation

## Hearing of Interstate Commerce Committee Brings Out Investors' Scrutinizing of Utility Securities—Testimony of Vice-President of Metropolitan Life Insurance Company

A NUMBER of points of importance to public utility companies and security holders were brought out at the hearing before the Senate committee on interstate commerce recently when Mr. Ecker, vice-president of the Metropolitan Life Insurance Company and chairman of the National Association of Owners of Railroads and Public Utility Securities, Inc., was heard. This association, it will be recalled, was reorganized recently as what might be called the mouthpiece of the large body of security holders in all classes of utilities and railroads, which comprises institutions which hold investments somewhat in the relation of trustees.

As was pointed out by Mr. Ecker, a great proportion of the population of the country is directly or indirectly affected either through direct holdings or through insurance companies. Over 62,000,000 individuals are affected, to a greater or lesser degree. Illustrating the wide interest in the subject, Mr. Ecker called attention to the fact that his own company alone has fourteen and a half billions of dollars of insurance in force, insuring individual lives in the number of about 27,000,000. This company's holdings of public utility securities are approximately $200,000,000. It was furthermore pointed out that savings banks have resources of $9,000,000,000 and have between eleven and twelve million individual depositors and these institutions hold between three hundred and three hundred and fifty million dollars of public utility securities.

Asked whether or not, in the course of his experience, Mr. Ecker had run across anything at all that would indicate that there is need for federal investigation of public utility companies, his answer was, "No!" He modified this, however, by explaining that the bonds which the company held were those only of operating companies in

which there was a direct mortgage on property. Relative to the nature of the inquiry, Mr. Ecker said: "As I observe it, this business must be very substantially, very materially and extensively expanded in the next few years, and thinking solely from the standpoint of the financial side of it I feel, and am confident that you would feel, that it is important that confidence in these securities and in these sound organizations should not be disturbed. I took comfort in the Senator's presentation of the subject yesterday, when he said he realized that danger and that it was farthest from his thought that such a result would ensue unless there should develop circumstances that would indicate there were abuses that should be corrected, but that it was his desire, or at any rate he felt the importance of doing nothing that would unduly disturb the credit situation. In conclusion, I only have to add that it is the hope of the interests that I am speaking for that if it be determined that an investigation be had it should be conducted in the form of a fact-finding matter and along the lines of a judicial inquiry. I emphasize that to you, as a part of our thought on the subject, with a great deal of confidence that this committee will have those considerations in mind."

### Factors Considered in Buying Securities

Mr. Ecker was asked whether, in buying bonds, his company makes a distinction between bonds issued by a corporation operating in a state where there is strong regulation resulting from vigorous policy and those where there is no regulation of that character. The answer was that there is a sort of framework or standard required to determine the acceptable offerings among these issues. This, it was admitted, would be one factor. Then there is the population served, the reasonable permanence of that property, the age of the property, its capacity, what its reports show are its costs of production compared with production costs in other localities or a similarly situated locality. Mr. Ecker stated that his company was particularly interested always in the methods of accounting of these operating companies, seeing to it that they set up proper reserves for depreciation and obsolescence. Mr. Ecker stated that his company would prefer to buy bonds where they are subject to state regulatory bodies because "Our observation is that even where these facilities are what might be termed monopolies, if they are regulated monopolies the service to the public is secured at a lower price than where there is competition without regulation. My personal opinion is that these securities would be safer for the public to invest in.”

Questioning by members of the committee elicited the information that the company rejects certain securities not always because of the question of security but sometimes because of the rate of interest. Sometimes the committee naturally feels that the offering does not yield as good a return as it should.

* Twelve months ended Nov. 30, 1927.

RECENT LISTINGS.—The New York Stock Exchange has authorized the listing of 79,000 additional shares of preferred stock of the American & Foreign Power Company, Inc. ($7 cumulative dividend), without par value, making the total amount of such preferred stock applied for 479,000 shares. The New York Exchange has also authorized the listing of additional cumulative 6 per cent preferred stock, series A, of the Columbia Gas & Electric Corporation to the amount of $2,666,600 and 13,372 additional shares of class A stock without par value of the Utilities Power & Light Corporation. There has been authorized the listing of 5,088 additional shares of common stock, class A, without par value, of the General Gas & Electric Corporation and 12,244 additional shares of its common stock, class B, without par value, on official notice of issuance and payment in full, making the total amount applied for 345,747 shares of common stock, class A, and 216,310 shares of the common stock, class B.

## Stock Sales to Customers Exceed $18,000,000

Sales of stock by electric light and power companies directly to customers and employees in November aggregated 243,400 shares valued at $18,303,000 and involving 24,410 transactions. These estimates are based on returns from companies serving 87 per cent of the whole number of customers of all companies selling securities locally, with estimates for companies not reporting.

After the year's minimum and maximum were successively reached in September and October the returns indicate that November was an average month as to value of securities, number of transactions and their average magnitude, the latter about $750. Sales in November, 1926, were $19,060,000, but the average transaction involved only $500. Of the $18,303,000 slightly less than $2,000,000 was in the form of low-priced shares, the balance was at or near $100 per share. Seven companies each reported over $1,000,000 and three of these approached or exceeded $2,000,000; $16,100 was reported in red, which is assumed to mean that securities were returned to the companies.

## Public Service of New Jersey to Raise $43,689,000

The Public Service Corporation of New Jersey will offer to its common and 8 per cent preferred stock holders this month twenty-year 4½ per cent convertible debentures to the amount of $43,689,000. The holders of each fifty shares of stock will have the right to subscribe for $500 principal amount of the new debentures at 98 and interest. The debentures will be convertible before Feb. 1, 1930, into common stock at the rate of twenty-two shares for each one-thousand-dollar debenture. Proceeds from the sale will be used to redeem $19,384,0000 of 6 per cent secured gold bonds and $15,000,000 of 5½ per cent secured bonds and for other corporate purposes.

## January Issues Total $98,850,000

During the month of January the electric light and power companies of the country issued new securities to the amount of $98,850,000, a figure which compares with $223,859,000 for January, 1927, and $303,332,500 for December, 1927. These two months, however, were the high spots in new electric light and power financing in 1927. The Continental Gas & Electric Corporation contributed $36,000,000 to the month's total, the issue being in the form of thirty-year gold debentures priced at 95½. The only other offering exceeding $10,000,000 was made by the Lexington Water Power Company, a piece of financing involving a sum of $12,000,000.

Financing in January was almost exclusively of a long-term nature. The average yield advanced from the 5.06 per cent mark in December to 5.40 in January, the highest rate since last June.

### *Security Issues of Electric Service Companies in January*

| Name of Company | Amount of Issue (Par Value) | Period Years | Class | Purpose | Interest Rate | Price | Per Cent Yield |
|---|---|---|---|---|---|---|---|
| American Water Works & Electric Co. | $3,000,000 | 47 | Gold debentures, series B | To reimburse company in part for expenditures in connection with the acquisition of additional properties, for additional working capital and for general corporate purposes | 5 | 95 | 5.28 |
| Lexington Water Power Co. | 12,000,000 | 40 | First mortgage gold bonds | Construction | 5 | 98 | 5.10 |
| | 5,000,000 | 25 | Convertible sinking fund gold debentures | | 5½ | 98½ | 5.60 |
| National Electric Power Co. | 5,000,000 | | Cumulative preferred stock | To retire notes and for other corporate purposes | 6 | 94½ | 6.35 |
| | 10,000,000 | .. | Secured gold debentures | | 5 | 94½ | 5.30 |
| Arizona Edison Co. | 1,700,000 | 20 | First mortgage gold bonds | Acquisition of certain properties and for other corporate purposes | 5 | 96 | 5.33 |
| Gulf States Utilities Co. | 3,000,000 | .. | Preferred stock | To provide additional capacity or to reduce notes payable | 6 | 100 | 6 |
| Central Public Service Corp. | 1,500,000 | .. | Cumulative preferred stock | To invest in additional stock | 7 | 100 | 7 |
| Continental Gas & Electric Corp. | 36,000,000 | 30 | Gold debentures | To retire securities | 5 | 95½ | 5.30 |
| United Public Service Co. | 2,400,000 | 14 | Collateral trust gold bonds, series A | To acquire additional subsidiary securities | 6 | 98 | 6.20 |
| Consolidated Gas, Electric Light & Power Co. of Baltimore | 10,000,000 | . | Cumulative preferred stock, series A | To retire outstanding issues and to reimburse for the cost of additions and for other capital expenditures | 5 | 100 | 5 |
| Washington Gas & Electric Co. | 1,250,000 | 25 | First mortgage gold bonds | | 5½ | 100 | 5.50 |
| Central States Utilities Corp. | 3,000,000 | 10 | Secured gold bonds | To acquire stocks of subsidiaries, to provide funds for the retirement of their bonds and stocks and for other corporate purposes | 6 | 98 | 6.25 |
| General Public Service Corp. | 5,000,000 | 25 | Convertible gold debentures | To provide funds for investment | 5 | 97½ | 5.19 |
| Total | $98,850,000 (par value) | | Rights | $657,750 | | | |
| Total amount actually realized | 95,626,500 | | Total financing for January | 96,284,250 | | | |

# Business News and Market Conditions

INDUSTRIAL equipment orders and inquiries continue to dominate the New England market. Small motor sales have gained and inquiries for turbo-generators of the lower ratings are being received by manufacturers. Increased buying is noted in the Eastern district, and one manufacturer stated that business appears to be even better than was expected. Orders are small, but gross sales are high. Wire and cable sales are slow, but present inquiries from the New York zone presage betterment. In the Southeast inquiries and orders show an increase. The engineering contract was let for a two-million-dollar plant in Texas. A textile mill contract let covered $70,000 worth of electrical materials and another planned involves $30,000 worth of electrical equipment.

In the St. Louis district business shows an improvement. Motors and control sold to a steel company amounted to $30,000 and elevator orders totaled $40,000. Industrial conditions improve in the Middle West and utility companies are planning many extensions. On the Pacific Coast several large projects include a 360,000-hp. hydro-electric plant on the Feather River, a 35,000-kw. steam turbine plant in the India Basin of San Francisco, a soap plant costing $700,000, two large apartment houses totaling $1,600,000 and transmission line installations in western Washington.

## *Large Order Placed in Metal Market*

Buying of non-ferrous metals has been small, but prices are little changed from those obtaining last week Wednesday in the domestic market. Copper has been particularly dull, but there is only a negligible decline in the quoted price. On Wednesday afternoon wire drawing interests entered the copper market rather unexpectedly and purchased about 5,000,000 lb. of copper at 14⅛ cents, delivered in Connecticut. These sales were distributed among several sellers and in the aggregate formed a considerable proportion of the business of a comparatively dull week. A moderate business was done in both lead and zinc, prices for the former tending to weaken as a consequence of material declines in London, while zinc became slightly firmer. Both buyers and sellers appear to be marking time. Primary producers of copper continue to stand pat at the 14⅛ cent price. Moreover, they have made sales at that figure each day during the week. On the other hand, one or two custom smelters have shaded the even eighth by from 2½ to 5 points. Incidentally, two interests that come under this classification have been firm at 14⅛ cents.

NEW YORK METAL MARKET PRICES

| | Jan 25, 1928 Cents per Pound | Feb. 1, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic.... | 14⅛ | 14⅛ |
| Lead, Am. S. & R. price | 6¼ | 6¼ |
| Antimony.......... | 10¾ | 11¼ |
| Nickel, ingot.......... | 35 | 35 |
| Zinc spots........... | 6 | 6 |
| Tin, Straits.......... | 55¼ | 54½ |
| Aluminum, 99 per cent | 24.30 | 24.30 |

Base copper wire price Feb. 1, 1928, 15⅞ cents.

## *Increased Buying Noted in Eastern District*

There is a noticeable increase in buying in the Eastern district, with industrial business leading by a good margin. Indications point to heavy commitments in the early weeks ahead. Orders are comparatively small, but the continuous character of present business is rounding out excellent gross sales. Inquiries are increasing in volume. Sales of fractional-horsepower motors have increased in the past few days and marked improvement is expected to continue. Crane motors are advancing in call and a nitrogen company in the northern New York territory has placed orders for about $20,000 worth with a leading manufacturer. The sales tendencies in control apparatus are giving encouragement in the New York market. A prominent company in this line reports a government contract for battleships and for the Bureau of Ordinance totaling about $90,000. A sizable order also has been secured from a baking concern in the West. Industrial locomotives are in demand and a gas company in Brooklyn has purchased two such units from a leading maker, and there is other business of this kind in sight. Electric elevator sales are rising to decidedly higher levels and commitments in excess of $50,000 have been secured by a representative manufacturer covering a large warehouse and bank in the metropolitan district.

While central-station turbine business is curtailed, industrial interests are making purchases of smaller-sized units. A company at Rochester has placed a contract, aggregating $50,000, for apparatus of this kind. A leading manufacturer of wire and cable says that business is slow at the present time. Some promising wire inquiries, however, have been received from utility companies in the New York zone, and a few weeks hence is expected to show betterment in the situation. Instrument business is passing through a quiet period, although radio-frequency meters are selling well. An order has been received recently from the government for apparatus of the latter sort, totaling $20,000.

Construction activities include the following: McClellan & Junkersfeld, Inc., New York, will prepare plans for a plant for the Great Western Power Company near San Francisco, with initial capacity of 35,000 kw. The Niagara, Lockport & Ontario Power Company will build a steel-tower transmission line at Salamanca, N. Y. The Paul Smith's Power & Electric Corporation will build new transmission lines in Franklin and Clinton Counties. The Public Service Electric & Gas Company, Newark, N. J., has purchased 176 acres at West Orange, N. J., for transmission line right-of-way and a switching station. The Philadelphia Electric Company plans an addition to its substation at Westmoreland Street and Hunting Park Avenue. The Pennsylvania Power & Light Company will take over properties in Northumberland and Wayne Counties and plans transmission line extensions. The Pennsylvania Power Company, Sharon, has applied for permission to build a transmission line over the Mahoning River, near Mahoningtown, Ohio. The United States Engineer, Pittsburgh, plans a power house at Lock No. 6, Allegheny River, and will soon take bids. The General Purchasing Officer, Panama Canal, Washington, D. C., is asking bids until Feb. 10, for motor-driven air compressors (Panama Schedule 1856).

## *Inquiries and Orders Increase in the Southeast*

Both inquiries and orders are on the increase in the Southeast and prospects for the next few months are very bright. The engineering contract for a two-million-dollar power plant in Texas has been let. The largest central-station order was from Alabama for varnished cambric cable amounting to approximately $50,000. The demand for distribution and small power transformers is active, with the orders coming from the territory generally. One company in Georgia ordered transformers to the extent of $8,300, while another company in the same state ordered transformers totaling $6,000. A Tennessee firm placed an order for distribution transformers amounting to $3,000 and a Florida company purchased distribution transformers totaling $1,500. Inquiries on transformer equipment are in much greater number than was the case this time last year. An interesting power company order was for $5,000 worth of watt-hour meters, while some other central-station orders were for cable and wire amounting to $3,100, arresters totaling $2,300 and small switches amounting to $2,000. One company ordered $1,200 worth of sign equipment.

Contracts were let last week on a textile mill addition involving $70,000 in electrical equipment and materials and an ice plant electrification calling for $10,000 worth of electrical materials. There is a new textile mill project for South Carolina, involving $30,000 worth of electrical equipment and materials, that is now in the hands of engineers and construction contracts will be let within the next four weeks.

Construction projects are as follows: The Florida Power & Light Company will extend the street-lighting system at Sarasota, Fla., at a cost of $18,000. The Woodmere Lumber Company, Venice, Fla., plans rebuilding a mill recently destroyed by fire with loss of about $100,000. The Crisp County Power Commissioners, Cordele, Ga., plan a hydro-electric plant on the Flint River, to cost $1,200,000, with transmission lines. Lexington, N. C., plans extensions in its transmission system to cost about $20,000. The Duke Power Company plans a transmission line from Canton, N. C., to Greenville, S. C. The Virginia Public Service Company, Charlottesville, Va., plans transmission lines in Bedford and Amherst Counties. The Virginia-Carolina Soapstone Company, Roanoke, Va., plans a plant near West Jefferson, N. C., to cost about $300,000. Bonds to the amount of $1,250,000 are to be issued by Crisp County, the proceeds to be used for a hydro-electric power development on the Flint River at Warwick, Ga.

## *Industrial Conditions Improve in Middle West*

Actual business placed in the Middle West justifies the optimism expressed at the beginning of the year. The first two weeks sales were not as good as the last two. It is apparent that a feeling of confidence in the future is manifested in most every business. Industrial conditions in the Calumet steel region were improved. The ninth blast furnace of the Gary works of the Illinois Steel Company was fired, giving employment to an additional 1,000 men. One of the large railroads placed an order for passenger cars, valued at $4,000,000, with a manufacturer in the Middle West.

The various utility companies are planning many extensions, additions and increases to service, buildings and distributing equipment. Among the interesting items ordered were: Three 500-kva. power transformers, ash pit overflow pump complete with appurtenances and ignition arches for six B. & W. boilers. Maintenance purchasing was quite large adding materially to the volume of business. Jobbers' sales have gradually increased, although the volume of business is not unusually large.

Construction projects are as follows: The Continental Ice Company, Chicago, Ill., will build an ice plant at Silvis, Ill., to cost $200,000. The Davenport Cement Company, Davenport, Iowa, plans a new mill at Buffalo, Iowa, to cost $1,350,000. The Cownie Tanning Company, Des Moines, Iowa, plans rebuilding of plant recently destroyed by fire with loss of $150,000. The Timken Roller Bearing Company, Canton, Ohio, plans a substation in connection with new plant units. The Cleveland Electric Illuminating Company, Cleveland, will build a substation on West Ninety-fifth Street, to cost about $100,000. Springfield, Ohio, plans an ornamental lighting system on Main Street. The Ice & Fuel Company, Youngstown, Ohio, plans an ice plant to cost $125,000. The Rhinelander Paper Company, Rhinelander, Wis., plans a new power plant. The Wisconsin Veneer Company, Rhinelander, Wis., plans rebuilding its mill recently destroyed by fire, to cost $100,000. The Wisconsin Electric Power Company will soon enlarge its Lakeside power plant, St. Francis, Wis., with installation of a 60,000-kw. turbo-generator unit.

## *Motor Sales Dominate in New England Market*

Industrial equipment orders and inquiries were outstanding features in the electrical market in New England. Small motor sales gained and one manufacturer recorded a volume amounting to more than $40,000. Another company reports a demand for sizes ranging up to 50 hp. with textile and shoe factories considering replacements. Inquiries for turbo-generators of the lower ratings are being received by manufacturers. Power apparatus and control equipment sales are steady, with the demand on a par with last year. Industrial electric furnaces continue to attract attention. Electrically driven ice plants are being considered in the district. Projects in eastern Massachusetts are under way and one in Hartford, Conn., calls for an expenditure of about $100,000. Electric refrigerator sales are gaining and one central-station company recently placed 60 among its employees.

Central-station supplies are receiving little attention and distributors report spotty conditions. Orders for cross-arms, weatherproof wire and line hardware are mounting, with railroads most active among buyers. The industrial situation in central Massachusetts is improving.

Construction projects are as follows: The Wilton Manufacturing Company, Maine, will add 60 looms to its weaving plant. The U.G.I. Company, Philadelphia, is making surveys in western Massachusetts for hydro-electric possibilities on the Konkapot River.

## *Business in St. Louis Shows Improvement*

Conditions in St. Louis show improvement. One of the steel companies bought $30,000 worth of motors and control apparatus for two main roll drives. A contract for elevator motors for addition to a hotel amounted to $20,000, and electrical equipment for six new elevators in a department store cost $20,000. An order for auxiliary motors and equipment for a large power station in the western part of Missouri amounted to $52,000, and another order covered $30,000 worth of lamp globes. A good demand for conduit, wire and other construction materials is reported.

Construction projects in the district are as follows: The Joplin Realty Company, Joplin, Mo., heads a project to install an ornamental lighting system on Main Street. Kennett, Mo., plans a municipal lighting plant to cost about $25,000. St. Louis plans an appropriation of $2,500,000 for an ornamental lighting system in the downtown district. The H. D. Lee Flour Mills, Inc., Salina, Kan., plans rebuilding plant recently destroyed by fire with loss of $100,000. Picher, Okla., plans an improved lighting system in the downtown section. The Public Service Company of Oklahoma plans extensions in its ice plant at Grove, Okla., and will build a transmission line to that place from Alto, Okla., to operate at 11,000 volts. The Arkansas Cold Storage Company, Little Rock, plans a cold storage and refrigerating plant to cost about $100,000. The Arkansas Power & Light Company, Little Rock, will install an ornamental lighting system on Markham Street. Colorado, Tex., and Snyder, Tex., both plan a municipal power plant and ice plant. The Houston Lighting & Power Company, Houston, Tex., plans a new substation on Richmond Road. The Hildago Utilities Company, Hildago, Tex., plans a power and ice plant. The Travis Cottonseed Products Company, Austin, Tex., plans a plant at Corpus Christi, Tex., to cost about $200,000. The Louisiana Power & Light Company will build a transmission line from Magnolia to Haynesville, La.

## *Large Projects Reported on Pacific Coast*

Large construction projects on the Pacific Coast include a soap plant for Long Beach at a cost of $700,000, two apartment houses for San Francisco, valued at $600,000 and $1,000,000 respectively, a can factory for San Francisco, and street lighting systems for Albany, Watsonville, and Suisun. San Jose has ordered thirty-four duplex standards totaling $10,000. Two huge power projects recently broached were one by the Pacific Gas & Electric Company for a 360,000-hp. unit on the south and middle forks of the Feather River, and another by the Great Western Power Company for a 35,000-kw. steam turbine plant in the India Basin of San Francisco. Small local power line orders are reported from Sacramento and Truckee, south San Francisco is in the market for a 40-box fire alarm system, and Glendale for four 200-amp feeder regulators. Power company orders include one carload of pole line hardware and two carloads of poles, also an inquiry for 1928 requirements of creosote, valued at about $30,000. Export orders include $6,500 worth of wire and wiring material for Mexico. Imports from the Far East were better during January than for the previous decade. Industrial orders include assorted oil well motors and transformers for the Kern oil fields, 2,500 ft. of submarine dredging cable and 3 250-hp. motors for a cement plant, and 72 lightning arresters for the Mt. Whitney area. Prices of conduit and loom boxes and of rubber-covered wire have decreased about 5 per cent and special inducements are being offered on 1,000 lots of certain schedule staples, marking perhaps a tentative return to the larger units of ordering.

Transmission line projects and the letting of large contracts were features of business in the Puget Sound district. The Puget Sound Power & Light Company purchased $100,000 worth of transmission wire, $42,000 worth of insulators and pole line hardware and $21,000 worth of poles for 188 miles of heavy transmission line from Sedro-woolley to Seattle to be known as the Baker River line No. 2. The same company will shortly begin construction of a 16-mile transmission line from Wenatchee to Moses Coulee, opening up 7,500 acres of agricultural lands. The city of Tacoma has awarded contract for the special underground duct system at the Nisqually substation and has bought 18,000 lb. of copper transmission wire. Owing to changes in route necessitating new plans and specifications for the transmission line between Morton and La Grande, the date of opening of bids has been indefinitely postponed. Motor sales reported were light last week, and aggregated about 60 units from 100 hp. down.

Construction projects are as follows: The Pacific Fruit Express Company, San Francisco, plans erection of an ice and cold storage plant at Tucson, Ariz. at a cost of $400,000. The Auburn Fruit Exchange, Auburn, plans an ice and precooling plant to cost about $100,000. The Coast Counties Gas & Electric Company plans a new equipment storage and distributing plant at Hollister, to cost $35,000. The Water and Power Commission, Los Angeles, is asking bids until Feb. 28, for generators, exciter, transformers, hydraulic equipment and accessory electric apparatus. The Sacramento Pulp & Paper Company, Sacramento, plans a new mill to cost $400,000. The Illinois-Pacific Glass Company, San Francisco, plans a new plant at Vernon, Calif., to cost $750,000. The National Lumber & Creosoting Company, Texarkana, Ark., plans a plant at Utah Junction, near Denver, Col., to cost about $350,000. The Idaho Power Company plans a hydro-electric power plant on Snake River, near American Falls, Idaho, to cost $1,500,000, with transmission line. Sand Point, Idaho, plans a municipal hydro-electric plant on Priest River, to cost $166,000. The Glacier County Light & Power Company, Cut Bank, Mont., plans a power plant on Two Medicine River with transmission lines, to cost $400,000. Great Falls, Mont., will buy high-duty pumping equipment for waterworks service, to cost $35,000. The Southern Pacific Railroad Company will build a new addition to its locomotive and car shops at Eugene, Ore., to cost about $250,000. Morton, Wash., is asking bids until Feb. 20, for construction of a transmission line from power plant near Alder, with distributing systems at Morton and Mineral, Wash. Culver City, Fresno, Pittsburg, Richmond, Ukiah, and Willows, all of California, plan ornamental lighting systems.

# Activities of the Trade

## General Electric Sells Welding Equipment to Ford

In the past few months the Ford Motor Company has installed approximately 30 General Electric automatic arc welding equipments. Although this is considered a fair-sized automatic welding installation, it is understood that it is but a beginning of the automatic arc welding operations planned by the Ford company. The increasing use of welding in automobile manufacture is demonstrated by the fact that a large number of parts on the new Ford car are constructed by arc welding. Among these welded parts are the rear axle housing, the steering gear casing, the radius rod, the spare tire carrier, the drag link for the front axle and the axle rods. It is said that experiments are now under way preparatory to welding several other parts in addition to these.

## Sterling Electric Motors Moves into New Plant

Recently organized in California, as announced in the Nov. 19, 1927, issue of the ELECTRICAL WORLD, Sterling Electric Motors, Inc., has moved into its new modern factory, located on Telegraph Road at Atlantic Boulevard, is installing most of its heavy machinery and expects to be in production early in February. The company will market the Sterling "Cros-Line" motor and will produce motors from ½ hp. to 30 hp.

## Lighting Schools Will Study Electrical Advertising

Under the direction of C. J. Eaton, chairman of the advertising committee of the National Electric Light Association, the first electrical advertising school will be opened March 5-8 at the Edison Lighting Institute of the Edison Lamp Works of the General Electric Company at Harrison, N. J. Experts in the electrical advertising world, central station men, electrical sign manufacturers and engineers of other interested companies will give courses designed to inform the industry as a whole of the developments among its component parts. Industry problems will be discussed, individual developments explained, future possibilities pointed out, and improvements toward benefiting the whole suggested.

A second school offering similar courses will be held at the Nela School of Lighting of the National Lamp Works of the General Electric Company at Cleveland, Ohio, March 19-22. The Westinghouse Lamp Company is co-operating with the General Electric Company under the committee on electrical advertising of the N.E.L.A. in both of these schools. Registration for the Harrison school should be made through A. D. Bell, Edison Lighting Institute, Harrison, N. J., or through J. J. McLaughlin, Westinghouse Lamp Company, Bloomfield, N. J., no later than February 27. Names of those planning to attend the course at Cleveland should be sent to L. C. Kent, Nela School of Lighting, Nela Park, Cleveland, or to J. J. McLaughlin, Westinghouse Lamp Company, Bloomfield, N. J., not later than March 12.

## Fire-Fighting Equipment Demonstrated

An exhibition and demonstration of the Phomene accumulator system of fire-fighting equipment was given in Newark, N. J., by the Globe Automatic Sprinkler Company, and the Pyrene Manufacturing Company on the afternoon of Jan. 19. The most spectacular part of the demonstration was the 30-ft. tank of oil which was ignited and allowed to burn for about ten minutes. Then the fire-fighting equipment was brought into action, and in two or three minutes a blanket of foam was formed over the oil and completely extinguished the fire. Although the other fires were not as spectacular as the oil tank, the efficiency with which they were handled indicated the effectiveness of the system.

The Phomene accumulator system consists of a tank containing a white powder which is connected to the water system, through an automatic valve, and to the object to be protected. When the water is turned into the powder a foam forms and flows through a foam-distribution system, over the object on fire. The fire is extinguished by the foam blanket excluding the air from the combustible material. Various methods may be employed for making the system automatic, such as sprinkler heads and thermostatic devices.

## Northern White Cedar Association Holds Meeting

A large and successful meeting was held by the Northern White Cedar Association this week at Minneapolis. It was the sense of the meeting that producers' facilities are in better shape than ever, and the high spot of the discussion centered around the promotion of the best service to customers. An attendance larger than at any previous meeting was recorded at the banquet on Tuesday evening. The new officers elected are: Guy Ramsey, president; Wilbur Lafean, vice-president; H. S. Gilke, treasurer, and N. E. Boucher, secretary. The board of directors includes L. A. Page, J. E. Gerich, Donald Bell and John Twomey.

The Peerless Electric Company, Warren, Ohio, announces that John M. Tuthill has been appointed general sales manager of the company. Mr. Tuthill, recently of Philadelphia, was formerly with the Niagara Falls Power Company. Phil F. Toman will be sales manager of the motor division of the company and will devote all his attention to that phase of the business.

The Insulation Manufacturing Company, Inc., is moving from 70 Washington Street, Brooklyn, to New York Avenue and Herkimer Street, Brooklyn, where 50 per cent more manufacturing space is available. Together with the General Insulate Company, which was acquired by the Insulation Manufacturing Company early last year, the products manufactured are "bakelite," molded parts for many electrical applications and insulators, including its trade marked goods "Electrose" and "Insulate."

The Master Electric Company, Linden and Master Avenues, Dayton, Ohio, held its annual sales convention at its plant last month.

The Electro-Kold Corporation, Spokane, Wash., early in December elected L. M. Simpson president and general manager. Mr. Simpson succeeds as president Dr. X. L. Anthony, who has become chairman of the board of directors, and C. L. Lewis, formerly general manager, who has resigned to take care of personal affairs.

The Conduo-Base Company, 2345 Carnegie Avenue, Cleveland, announces the development of its "Junior Conduo-Base" for the wiring of buildings. The United Metal Products Company, Canton, Ohio, and the Dahlstrom Metallic Door Company, Jamestown, N. Y., are licensed manufacturers.

Porter & Ross, Inc., 30 Church Street, New York, manufacturers' agents, announce the opening of branch offices at the Monadnock Building, Chicago, 839 Oliver Building, Pittsburgh, and 1002 Louderman Building, St. Louis.

The C. H. Wheeler Manufacturing Company, Philadelphia, manufacturer of condensers, pumps and cooling towers, announces that the Reeves & Skinner Machinery Company of St. Louis and Kansas City has been appointed agent for those territories.

The Trumbull Electric Manufacturing Company, Plainville, Conn., announces the opening of its Boston sales office in the Statler Building, room 1002. J. S. Ingebretsen is in charge of the office. The company also announces the appointment of Frank M. Buckley as sales representative in the Pittsburgh district. He will work this year with A. H. Bergendahl, the present salesman.

The R. H. Beaumont Company, 319 Arch Street, Philadelphia, Pa., manufacturer of skip hoists, cable drag scrapers, etc., announces that L. O. Hassler, formerly chief engineer, has been transferred to its Western headquarters at the Strauss Building, Chicago, and he will devote himself to sales in the Chicago territory under the direction of H. E. Birch. The company also announces that William P. Alexander, who resigned from the organization in May of last year, has returned to the sales department and will devote himself to sales duties in the Philadelphia, Baltimore and Washington district.

The Daniel Woodhead Company, Chicago, has placed on the market the "Protex" rubber-handled portable extension lamp and the "Vaprotex" vaporproof portable extension lamp.

The Rome Wire Company, Rome, N. Y., a division of the General Cable Corporation, announces the appointment of Jenkins & Gunther, Unit 2, Santa Fe Building, Dallas, Tex., as sales agents. The territory covered will include the states of Texas, Arkansas, Oklahoma and western Louisiana.

The National-Harris Wire Company, Newark, N. J., has leased for ten years, with option to purchase the Heller Brothers' file works at Mount Prospect and Verona Avenues. Paul Heller will become actively associated with the company.

# New Equipment Available

## Thermostat and Relay

An electric immersion thermostat suitable for maintaining liquid temperatures within a range of plus or minus 5 deg. F. has been added to the line of temperature control equipment of the Wilcolator Company, 17 Nevada Street, Newark, N. J. It is supplied in three ranges of temperatures: 50 to 150 deg. F.: 100 to 300 deg. F., and 250 to 550 deg. F. The unit has a bulb immersion of 2⅜ in. and is threaded for ½-in. standard pipe. Three wire control is used through a relay, the terminals are arranged for open wiring, armored cable or conduit connection, and the maximum voltage is 250. Calibration is secured by removing the cover and moving the adjustment lever to the desired temperature to be maintained. Its application is particularly well suited to electric water heaters, urns, sterilizers and similar apparatus requiring close temperature control.

A relay also has been designed particularly for three-wire control through thermostats or other pilot means and is built for alternating current only with a rating of 110 volts, 25 or 60 cycles, 30 amp. or 220 volts, 60 cycles, 15 amp. It is designed for non-inductive circuits only and in operation it is said to be particularly quiet.

Indoor Bus Support.—A new line of low-voltage indoor bus supports which embody complete interchangeable features has been placed on the market by the Line Material Company, South Milwaukee, Wis. The line embodies a variety of types for mounting buses either vertically or horizontally and on any type of structure as well as for mounting round buses. The bus supports are available for 750-volt and 2,300-volt service.

Portable Tinning Pot.—A portable tinning pot has been added to the line of electric heating equipment of the General Electric Company. It is used for small tinning and soldering operations. It is built on the same principle as the larger melting pots made by the company. The heating unit, which is of the cartridge type, dissipates 150 watts. This pot is particularly designed for solder and tin, having a maximum operating temperature of 500 deg. F. About 15 minutes only are required to reduce the full contents of the pot to working temperature. While the pot is normally designed for operation on 110-volt circuits, it can be supplied for operation on 100-, 120-, or 240-volt circuits if desired. It has an approximate shipping weight of 6 lb.

## Multiple Duct Slant Conduit

A multiple duct slant conduit especially adapted for building curves of various radii has been developed by the National Fire Proofing Company, Pittsburgh, manufacturer of "Natco" underground clay conduit, with the assistance and co-operation of the Bell Telephone Laboratories, New York. These slant conduits have been made and used for some years in the single duct shapes but this idea has now been applied to various multiple duct shapes including 2, 3, 4, 6 and 9-way. These multiple duct slants used alone or in combination with the straight short pieces of the same multiple may be used in building curves from 10 ft. to 25 ft. radius as well as in various angles such as 15, 22½, 30, 45, 60 and 90 deg.

Recording Thermometer.—A 72-hour recording thermometer 6 in. in diameter by 3¾ in. high has been placed on the market by the Bristol Company, Waterbury, Conn. The instrument is useful in obtaining data on commercial and residential installations before and after electrical units are placed in service. It is drum-shaped, without tubes or cables, and has a range of from 30 to 70 deg. F. It may be placed flat or hung on a hook. As a central-station sales department adjunct it is designed to eliminate many causes of argument over temperature conditions in prospective customers' apparatus and to aid in the adjustment of new installations to local service conditions.

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued Jan. 3, 1928)

1,655,035. Regulating System; E. F. W. Alexanderson, Schenectady, N. Y. App. filed Jan. 17, 1925.

1,655,036. Control of Electric Power; E. F. W. Alexanderson and A. H. Mittag, Schenectady, N. Y. App. filed April 25, 1925.

1,655,037. Locomotive Control; E. F. W. Alexanderson, Schenectady, N. Y. App. filed May 25, 1925.

1,655,038. Power-Factor-Control System; E. F. W. Alexanderson, Schenectady, N. Y. App. filed Aug. 5, 1925.

1,655,040. Control of Electric Power; E. F. W. Alexanderson and A. H. Mittag, Schenectady, N. Y. App. filed Dec. 15, 1925.

1,655,041. Regulating Apparatus; E. F. W. Alexanderson, Schenectady, N. Y. App. filed Jan. 15, 1926.

1,655,042. Speed-Control System; E. F. W. Alexanderson, Schenectady, N. Y. App. filed July 14, 1926.

1,655,050. Sealing-in Machine for Tubes and Bulbs; C. Eisler, Newark, N. J. App. filed April 25, 1925.

1,655,051. Machine for Making Stems for Incandescent Lamps; C. Eisler, Newark, N. J. App. filed July 1, 1926.

1,655,087. Shade Mounting; A. Bostroem, Roselle, N. J. App. filed July 24, 1924. For portable desk lamp.

1,655,102. Lighting Fixture; V. G. Kay, Cleveland, Ohio. App. filed Jan. 20, 1926.

1,655,106. Electrical Conductor; C. A. Parsons, J. Rosen, A. W. Grey and B. Blair, Newcastle-on-Tyne, England. App. filed Nov. 9, 1925. Of a flat, elongated form suitable for the slot windings of dynamo-electric machines.

1,655,119. Protected Thermometric Electric Circuit Closer; E. B. Wilson, East Orange, N. J. App. filed Feb. 18, 1927.

1,655,142. Elevator Signaling System; R. H. Gaylord, Los Angeles, Calif. App. filed March 26, 1925.

(Issued Jan. 10, 1928)

1,655,404. Outlet Box Cover; A. J. Bassett, Brooklyn, N. Y. App. filed Feb. 7, 1921.

1,655,405. Electrical Connecter; H. W. Batcheller, Bethel, Vt. App. filed Aug. 1, 1924. Comprising a socket provided with internal conducting members adapted to connect the lamp, which is placed at one end of the socket with a conducting cable at the opposite end.

1,655,408. Governor-Operated Switch; J. E. Boyce, Yonkers, N. Y. App. filed Sept. 29, 1923.

1,655,413. Electric Water Heater; E. L. Emerson, Braintree, Mass. App. filed Dec. 15, 1921.

1,655,430. Electric Circuit - Closing Means; H. L. Merrick, Passaic, N. J. App. filed May 10, 1924. For use in connection with balances and automatic weighing mechanism.

1,655,451. Electric Current Regulator; C. S. Agate and A. E. Hill, Chelmsford, England. App. filed Aug. 8, 1922.

1,655,453. Electromagnet; H. W. Brown, Schenectady, N. Y. App. filed May 15, 1923.

1,655,464. Electric Switch; H. J. H. Huber, Schenectady, N. Y. App. filed April 10, 1922. Oil switch.

1,655,465. Grounding and Testing Arrangement; H. J. H. Huber, Schenectady, N. Y. App. filed March 10, 1926

1,655,466. Method and Apparatus for Treating Filaments; G. E. Inman, East Cleveland, Ohio. App. filed June 9, 1926.

1,655,469. Power System; C. MacMillan, Schenectady, N. Y. App. filed April 27, 1923. In which a plurality of prime movers such as Diesel engines or steam turbines are utilized to drive the generators which supply power to the propeller motor.

1,655,470. Electric Ship Propulsion; C. MacMillan, Schenectady, N. Y. App. filed March 21, 1924.

1,655,475. Electric System; D. C. Prince, Schenectady, N. Y. App. filed Aug. 12, 1925. Wherein current transmitted between direct and alternating-current circuits is rectified or derectified by an electric valve apparatus.

1,655,479. Electric Heater; H. E. Strunk, Ontario, Cal. App. filed Jan. 16, 1924. Means for protecting from overheating, particularly for electric flatirons.

1,655,480. Electric Heater; R. L. Uhl, Ontario, Cal. App. filed Jan. 3, 1923. Means for protecting electric heaters from overheating.

1,655,488. Electric Incandescent Lamp; H. Wolff, F. Koref and F. Skaupy, Berlin, Germany. App. filed Nov. 3, 1925.

1,655,492. Kilovolt - Ampere - Demand Meter; H. J. Blakeslee, West Hartford, Conn. App. filed Feb. 9, 1924.

1,655,493. Secondary Electric Clock; T. S. Casner, Plainfield, N. J. App. filed Sept. 6, 1924.

1,655,502. Incandescent Electric Lamp; G. Holst, Eindhoven, Netherlands. App. filed March 11, 1927. In which the absorption of light is reduced by means of a substance usually called a "getter."

1,655,528. Electric Ignition System for Gas Burners; E. T. Banzhaf, San Francisco, Cal. App. filed Dec. 6, 1922.

1,655,540. Moth Exterminator; A. C. Friedel, Syracuse, N. Y. App. filed Jan. 29, 1927.

1,655,554. Device for Electric Therapeutic Treatment; J. A. Lev, Peoria, Ill. App. filed May 8, 1926.

1,655,590. Automatic Traffic Signal; H. J. Borgerding and J. F. Borgerding, Oakland, Cal. App. filed March 20, 1924. For directing traffic at the intersections of highways or streets.

1,655,598. Battery Terminal Connecter; S. Diller, Des Moines, Iowa. App. filed Oct. 18, 1926.

1,655,604. Electricity Meter; J. Harris, Lafayette, Ind. App. filed Jan. 22, 1926. Means for causing such a meter to operate accurately over a wide load range.

1,655,663. Regulator System; H. W. Rogers and E. H. Horstkotte, Schenectady, N. Y. App. filed Feb. 13, 1926. For segregated drives such as paper-machine drives.

1,655,665. Electric Waffle Iron; J. L. Shroyer, Oak Park, Ill. App. filed Aug. 2, 1926.

1,655,694. Electric Switch; F. Gropp, Berlin, and M. Butterlin, Neubabelsberg, Germany. App. filed Jan. 6, 1927. Fluid-break type.

1,655,706. Cable Splice; E. C. Kirk, St. Albans, W. Va. App. filed April 25, 1923.

1,655,708. Stand for Electric Flatirons; C. L. Moyer, Chicago, Ill. App. filed Nov. 30, 1925.

1,655,717. Brush for Small Motors and Dynamos; R. H. Wappler, Yonkers, N. Y. App. filed May 27, 1924.

1,655,720. Heating Unit and Method of Making Same; H. A. Ziola, Toledo, Ohio. App. filed March 28, 1925.

1,655,746. Electric Boudoir Lamp; C. Wachtel, New Hyde Park, N. Y. App. filed Jan. 16, 1925.

1,655,760. Timing Device; H. F. Delmanhorst, Louisville, Ky. App. filed Sept. 29, 1925. Employed in automatically operating varicolored lights as at street crossings.

1,655,761. Electric Incandescent Lamp; P. Duffy, San Francisco, Calif. App. filed April 2, 1927. Adapted for electrotherapeutical, general lighting and automobile headlight uses.

1,655,781. Apparatus for Electroplating; G. Caraccio, Genoa, Italy. App. filed Aug. 3, 1926.

1,655,783. Electrode for the Combined Therapeutic Application of High-Frequency Current and of Ultra-Violet Radiation; R. Gallois, Lyons, France. App. filed Sept. 14, 1926.

1,655,824. Motor Construction Having Cooling-Oil Circulation; B. F. Schmidt, Los Angeles, Calif. App. filed Sept. 30, 1925.

1,655,834. Electric Rain Switch; F. Dzierzenga, Brooklyn, N. Y. App. filed Sept. 20, 1926. Switches provided with means to collect raindrops, the weight of the collected rain water causing the switch to close the electric circuit.

1,655,837. Subway Transformer; S. Horelick, Pittsburgh, Pa. App. filed Dec. 17, 1925.

1,655,838. Electrical Heater Element; E. C. Lackland, New Haven, Conn. App. filed May 7, 1924.

1,655,842. Fuse; E. F. Pelletier, St. Joseph, and W. Bandlow, Benton Harbor, Mich. App. filed Sept. 10, 1925. With means for visibly indicating fusing of the fusible element.

1,655,857. Method of and Element for Heating Hovers; H. O. Cunard, Modesto, Calif. App. filed May 13, 1925.

1,655,892. Insulator; B. E. Colburn, Green Bay, Wis. App. filed June 30, 1926. For radio antennas.

1,655,928. Circuit Controller; H. N. Wade, Milwaukee, Wis. App. filed July 19, 1919. Applicable to the control of polyphase circuits for effecting automatic interruption under conditions of phase failure or phase reversal or upon predetermined reduction of the line voltage.

1,655,929. Electrical Connecting and Supporting Device; E. C. White, New York, N. Y. App. filed April 28, 1923. For fixtures.

1,655,930, 1,655,931. Oil-Refining Still and Method of Making the Same by Electric Arc Welding; W. F. Woolard, Wauwatosa, Wis. Apps. filed Feb. 27, and March 13, 1926.

1,655,952. System and Method of Commutation for Frequency Changers; R. E. Hellmund, Swissvale, Pa. App. filed April 18, 1922.

1,655,965. Impulse Starter for Magnetos; S. D. Livingston, Freeport, N. Y. App. filed April 1, 1926.

1,655,966. Arc Incandescent Lamp; C. F. Lorenz, East Orange, N. J. App. filed March 14, 1923.

1,655,967. Thermal Relay; H. D. Matthews, Mansfield, Ohio. App. filed Nov. 21, 1925.

1,655,972. Lightning Arrester; S. M. Pineles, Pittsburgh, Pa. App. filed Feb. 23, 1922.

1,655,983. Induction Furnace; P. H. Brace, Wilkinsburg, Pa. App. filed April 2, 1927.

1,656,013. Electrical Measuring Instrument; R. T. Pierce, East Pittsburgh, Pa. App. filed Jan. 30, 1923. With means for limiting the movement of the index or pointer members.

1,656,052. Terminal Connecter for Toy Railways; A. R. Fergusson, Buffalo, N. Y. App. filed Sept. 27, 1922.

1,656,066. Dry Cell; W. F. Hendry, Ossining, N. Y. App. filed Jan. 23, 1924.

1,656,091. Depolarizing Mix for Dry Cells; V. Yngve, South Orange, N. J. App. filed March 24, 1924.

1,656,116. Electrical Measuring Instrument; W. E. Hull, Sharpesville, Pa. App. filed April 14, 1926. For measuring the ohmic resistance of any given conducting element.

1,656,121. Refillable Electric Fuse; F. C. La Mar, Pittsburgh, Pa. App. filed Dec. 1, 1924.

1,656,142. Electric Hair Waver; S. Cocroft, New York, N. Y. App. filed Aug. 28, 1926.

1,656,151, 1,656,152. Electric Switch; G. B. Thomas, Bridgeport, Conn. Apps. filed Oct. 28, 1920, and Feb. 4, 1922. Mechanically operated switch associated with an automatic actuating mechanism of any suitable sort, connected, for instance, with the mechanism of a washing machine.

(Issued Jan. 17, 1928)

16,851 (reissue). Switch; H. D. James, Edgewood, Pa. App. filed Feb. 20, 1920. Electromagnetic switch of the "lockout" type.

1,656,174. Braking Mechanism; A. C. Dahl, Hinsdale, Ill. App. filed June 30, 1926. For motor driven apparatus.

1,656,188. Electric Switch; F. Favarger, Neuchatel, Switzerland. App. filed Feb 19, 1926. Quick make and break.

1,656,203. Electric Storage Apparatus; P. Kapitza, Chesterton, England. App. filed Aug. 26, 1924. "Flash" discharge accumulator.

1,656,247. Arc Regulator; H. H. Strong, Toledo, Ohio. App. filed Jan. 18, 1926. For effecting and regulating the feed of the electrodes of the arc of a motion-picture projector.

1,656,274. Electric-Welding Apparatus; H. S. Holmes, New York, N. Y. App. filed Feb. 9, 1925.

1,656,313. Control System; H. L. Blood, North Plainfield, N. J., and R. C. Deale, Plainfield, N. J. App. filed Nov. 19, 1923. For operating machine tools.

1,656,321. Protection of Lamp Controllers; E. Dick, Geneva, Switzerland. App. filed May 5, 1924. For train-lighting systems.

1,656,329. High-Tension Cable Adapted for Small Currents; E. G. Sievert and H. Svensson, Sundyberg, near Stockholm, Sweden. App. filed Nov. 11, 1925. As used in Röntgen-ray apparatus.

1,656,383. Safety Switch; W. E. McCoy, New York, N. Y. App. filed May 4, 1920. With switching means for entirely disconnecting the fuses from the circuits when the switch is opened.

1,656,395. Terminal; A. B. Saurman, Pittsburgh, Pa. App. filed Dec. 17, 1924. Used in the installation of electrical service lines.

1,656,399. Electrical Switch: A. G. Steinmayer, Milwaukee, Wis. App. filed July 31, 1924. Quick-break cut-out switch.

1,656,407. Switch Mechanism; P. F. Williams and J. Rah, Chicago, Ill. App. filed June 25, 1926. Junction box with disconnecting pothead.

1,656,421. Heat-Balance System: C. W. Clarke, New York, N. Y. App. filed July 16, 1923. In steam-driven, power generating plants.

1,656,458. Electromagnet Construction; L. J. Wahl, Sterling, Ill. App. filed Sept. 25, 1925. Adapted for use in restricted space.

1,656,510. Electric Furnace for Melting or Producing Glass, Water-Glass, Cement, or Other Substances; C. F. Cornelius, Stockholm, Sweden. App. field Feb. 26, 1926.

1,656,518. Electric Water Heater; W. J. Hammers, Grand Rapids, Mich. App. filed Aug. 23, 1926. Induction type.

1,656,689. Train-Signal System; W. E. Benn and G. E. Davies, Troy, N. Y. App. filed May 10, 1920.

1,656,690. Heat Pencil; G. W. Blackburn, Elgin, Ill. App. filed Sept. 7, 1926. For making marks on paper, fabric or the like by charring or burning the fabric.

1,656,703. Electric Switch; B. E. Getchell, Plainville, Conn. App. filed Sept. 4, 1926. With means for preventing the formation of an injurious arc in the opening movement of the switch and for snuffing out such minor arcing as may form.

1,656,709. Electric Oven; S. L. Kelly, Toledo, Ohio. App. filed Jan. 27, 1927.

1,656,725. Cluster Outlet for Electric Lamps; F. Chadwick, Hamilton, Ontario, Canada. App. filed Dec. 10, 1926.

1,656,729. Lamp-Bulb Holder; C. E. Godley, Detroit, Mich. App. filed Jan. 25, 1926.

1,656,750. Road Switch for Electric Garage Doors; R. V. Morse, Ithaca, N. Y. App. filed April 25, 1925.

1,656,753. Storage Battery; P. E. Norris, Wilkinsburg, Pa. App. filed Nov. 17, 1924.

1,656,768. Testing Device for Electric Wiring Systems; S. B. Berkowich, Baltimore, Md. App. filed Jan. 8, 1927.

1,656,777. Combination Heat and Light Therapy Lamp; H. Dennis, New York, N. Y. App. filed Nov. 6, 1924.

1,656,792. Rosette; C. A. Jameson, Franklin, Neb. App. filed Sept. 30, 1925.

1,656,793. Electric Bulb; F. K. Kayte, Farr, Col. App. filed Oct. 27, 1924.

1,656,797. Splicer for Power Lines; J. D. Scott, Curfew, Ky. App. filed May 26, 1926.

1,656,800. Electric Cut-Out and Fuse; W. J. Turenne, Danvers, Mass. App. filed Oct. 6, 1922.

1,656,837. Circuit Breaker; H. F. Smith, Dayton, Ohio. App. filed April 21, 1924. Which will break the circuit without producing objectionable arcing at the contacts.

1,656,851. Circuit Breaker; C. E. Anderson, Stratford, Conn., and W. H. Keefe, Jr., Bridgeport, Conn. App. filed June 24, 1925. Thermostatically controlled.

1,656,856. Electric Appliance Having Pin Contacts and Method of Manufacturing the Same; W. J. Gagnon, Bridgeport, Conn. App. filed Dec. 20, 1926.

# New Trade Literature

OVERHEAD CONSTRUCTION MATERIALS.—The Copperweld Steel Company, Glassport, Pa., is distributing a leaflet containing data on Copperweld non-rusting construction materials for overhead lines (wood-pole construction).

RECORDING THERMOMETER. — The Bristol Company, Waterbury, Conn., is distributing bulletin No. 363 describing its new small-sized Bristol recording thermometer.

ELECTRICAL SUPPLIES. — The Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., is distributing its large complete catalog of electrical supplies for 1928-1930, containing 1,171 pages. It is a complete and up-to-date reference book of the electrical supplies made by the company and describes and illustrates the material.

CONNECTORS.—A bulletin issued by the Burndy Engineering Company, Inc., 10 East Forty-third Street, New York City, describes and illustrates the Burndy outdoor connectors equipped with "Everdur" parts.

ARC WELDING AND OUTDOOR STATION EQUIPMENT.—The General Electric Company, Schenectady, N. Y., is distributing bulletin No. GEA-823 covering its atomic hydrogen arc welding equipment for hand welding on 60-cycle circuits and bulletin No. GEA-460 B describing its types TA-1, TA-2, TA-5 and TA-6 horn-gap and disconnecting switches for outdoor station equipment.

TIME RECORDER.—Bulletin No. 1127 issued by the Esterline-Angus Company, Indianapolis, Ind., covers its new time recorder, an instrument for recording the time and duration of events.

EXCAVATOR AND CRANES. — The Harnischfeger Corporation, Milwaukee, has issued bulletin GH-2, covering its model 200 "P&H groundhog" for use as a shovel, dragline, clamshell crane, skimmer-scoop or trench-hoe. The company is also distributing bulletin 650-X describing the "P&H" model 206B excavator cranes.

TELEPHONE SYSTEMS.—Catalog No. 1110 issued by the Federal Telephone Manufacturing Corporation, Buffalo, N. Y., covers its complete line of interior private telephone systems and switchboards for apartment houses, schools, offices, industrial plants, residences, hospitals, etc.

LIGHTING FIXTURES. — The Artistic Lighting Equipment Association, 420 Lexington Avenue, New York City, has issued a booklet describing its sales promotion and refixturing campaign.

TRUCK AND TRAILER CRANES.—Bulletin No. 639-X issued by the Harnischfeger Corporation, Milwaukee, describes and illustrates its model 203-A "P&H" truck and trailer cranes.

PROTECTIVE PRODUCTS.—The Colt's Patent Fire Arms Manufacturing Company, Hartford, Conn., has isued catalog No. 56, covering the "Noark" meter service and safety switches, fuses, service and fuse boxes, underground boxes and fittings, and molded products and line material. The company is also distributing a miniature, pocket size reproduction of this catalog, which contains the switch and fuse sections only.

BLOWER. — A bulletin issued by the National Flue Cleaner Company, Inc., Groveville, N. J., describes the National soot blower.

CRANES. — The Whiting Corporation, Harvey, Ill., has issued catalog No. 209, superseding No. 200, covering its complete line of cranes. This catalog contains many illustrations of crane installations.

BALL AND ROLLER BEARINGS.—The Timken Roller Bearing Company, Canton, Ohio, has issued a booklet entitled "The Truth About Anti-Friction Bearings," discussing their design, their function, their necessity and their performance.

RESISTORS.—Bulletin No. 111 issued by the Monitor Controller Company, Baltimore, Md., describes and illustrates the Monitor edgewound, hexwound and smoothwound resistors.

MOTORS AND CONTROL. — Bulletin GEA-761A, GEA-891, GEA-892, GEA-893 and GEA-910 issued by the General Electric Company, Schenectady, N. Y., describes and illustrate respectively, the improved brush holders for GE-57 railway motors, motors and control for ventilating fans in coal and metal mines, G-E motor drives for centrifugal pumps in coal and metal mines, geared induction-motor type electric drive for coal and ore hoists and the proper method of removing and replacing pinions for type HM industrial haulage motors.

LIGHTING EQUIPMENT.—The Lightolier Company, 569 Broadway, New York City, has issued a new catalog entitled "How to Make a Profitable Retail Fixture Sale."

FANS.—"New Sales Helps for Your 1928 Fan Business" is the title of catalog No. 1363 issued by the Robbins & Myers Company, Springfield, Ohio. It contains booklets and folders for distribution, photographic display signs, etc.

LIGHTNING ARRESTERS.—Booklet No. 245 issued by the Electric Service Supplies Company, Seventeenth and Cambria Streets, Philadelphia, covers its Keystone crystal valve lightning arresters. Illustrations are given showing typical installations of the arresters.

ELECTRIC DRIVE FOR MOTOR BUSES.—The General Electric Company, Schenectady, N. Y., has issued bulletin GEA-855 entitled "The Application of Electric Drive to Motor Buses," in which it gives illustrations of buses equipped with the G-E electric drive.

CONDUIT.—The National Fire Proofing Company, Pittsburgh, is distributing a pamphlet covering the "Natco" underground clay conduit of various shapes and sizes.

HIGH-POTENTIAL FUSES. — Bulletin 200A issued by Schweitzer & Conrad, Inc., 4435 Ravenswood Avenue, Chicago, describes and illustrates the S & C high-potential fuse for 2,200-volt to 132,000-volt service in capacities from ½ amp. to 400 amp. In addition to ordering information covering ratings, dimensions, weights, etc., a number of important subjects are discussed as the S & C fuse and its relation to electric power systems, the S & C fuse and the requirements for interrupting high-voltage circuits, the S & C fuse and the fundamentals of fuse design, how the S & C fuse operates, application recommendations, etc.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

Purchase is desired in Breslau, Germany (No. 29,255), of storage batteries.

Purchase is desired in Lille, France (No. 29,272), of wooden battery separators and battery parts.

Purchase and agency are desired in Glasgow, Scotland (No. 29,327), for electrical appliances such as switches, lamp fittings, and wiring supplies.

Purchase and agency are desired in Vienna, Austria (No. 29,283), for household electrical appliances.

Purchase is desired in Toronto, Canada (No. 29,280), of household electrical appliance parts for assembling.

Purchase or agency is desired in Toronto, Canada (No. 29,279), for quartz ultraviolet ray lamps or quartz burners for such lamps.

An agency is desired in Konstanz, Germany (No. 29,340), for electrical machinery.

Purchase and agency are desired in Durban, South Africa (No. 29,326), for electrical machinery and wiring supplies.

Purchase is desired in Madrid, Spain (No. 29,278), of electric refrigerators and electric vacuum cleans and floor waxers.

Purchase is desired in Magdeburg, Germany (No. 29,274), of electric vacuum cleaners.

Purchase is desired in Delitzsch, Germany (No. 29,275), of electric vacuum cleaners.

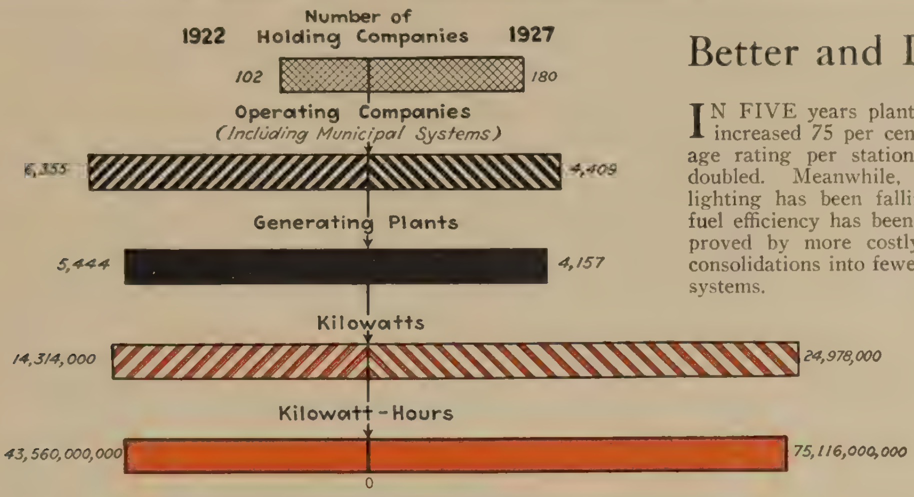
Purchase is desired in Leipzig, Germany (No. 29,276), and another (No. 29,277), of electric vacuum cleaners and floor polishers.

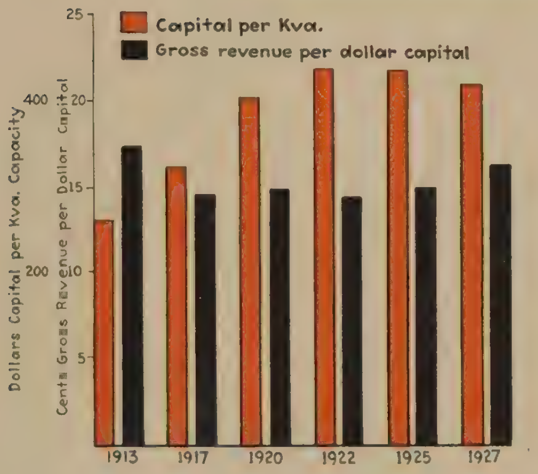
# Business Facts for Electrical Men

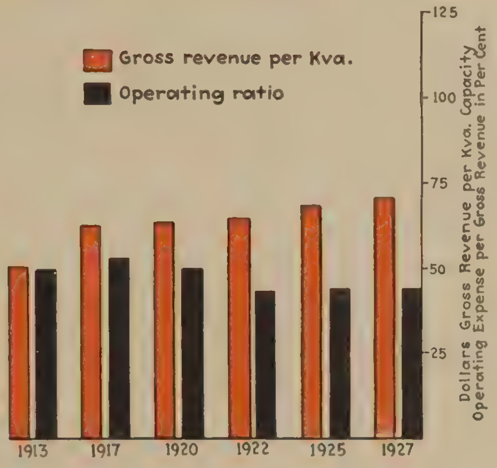
Selected Statistics Presented Graphically for
the Use of All Interested in Analyzing the
Trend of the Electrical Business

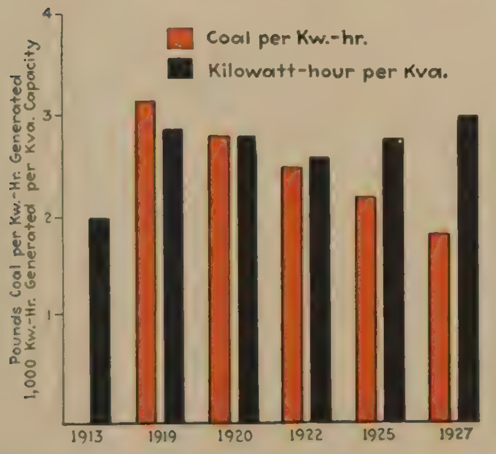
## Better and Larger

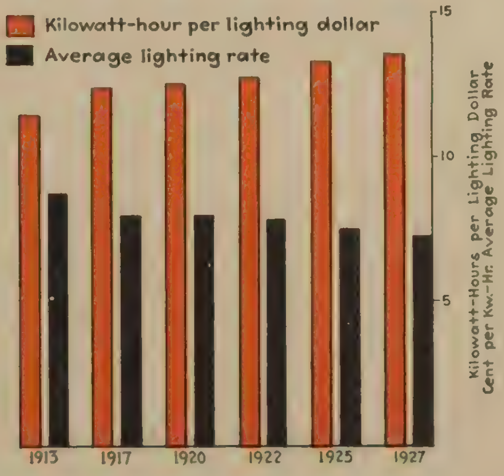
In FIVE years plant and output increased 75 per cent; the average rating per station more than doubled. Meanwhile, the cost of lighting has been falling steadily; fuel efficiency has been greatly improved by more costly plant and consolidations into fewer and larger systems.











# Western States Increase Productive Operations by 2 Per Cent During 1927

THE year 1928 opened with the manufacturing plants of the Western States operating on a plane about 8.2 per cent over that at the opening of 1927. This rate of annual increase in production in this section is about the rate of annual growth which has been witnessed during the past three years, which in turn is an indication that in general the manufacturing plants of the West have not been subject to the same influences which have affected general industry in the nation as a whole.

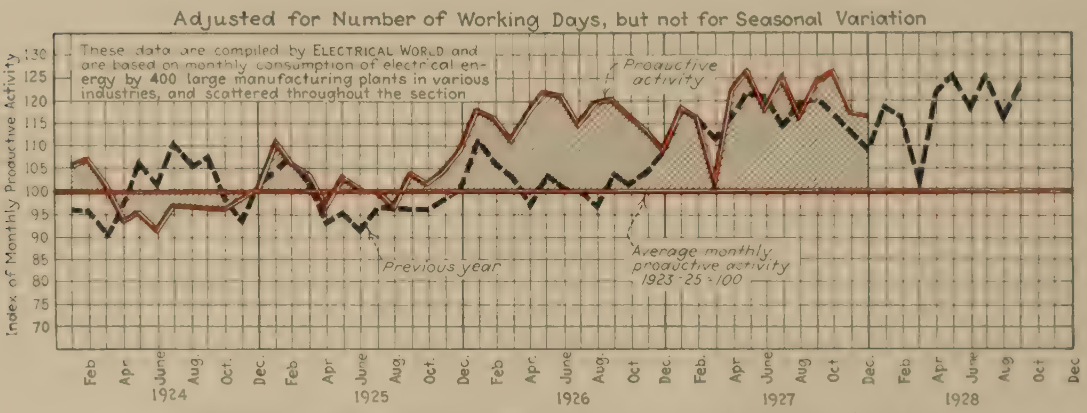
Operations of manufacturing plants in this section during 1927 as a whole were 2 per cent over those reported during 1926, which was materially under the annual industrial gain recorded in this section during 1926. The year just closed, however, witnessed general industrial operations above those of the same months in 1926, with the exception of February, March, June and August. There is every reason to believe that 1928 industrial production in the Western States will be over that of 1927.

*Indexes of Productive Activity in the Western States*

All Figures Adjusted for Number of Working Days

| | Dec., 1927 | Nov., 1927 | Dec., 1926 | Average for Full Year, 1927 | Average for Full Year, 1926 |
|---|---|---|---|---|---|
| All industries | 116.9 | 117.0 | 108.0 | 118.8 | 116.5 |
| Chemical and allied products | 84.7 | 89.4 | 105.6 | 103.4 | 119.7 |
| Food and kindred products | 148.5 | 140.0 | 95.2 | 123.2 | 103.4 |
| Lumber and its products | 110.7 | 120.0 | 105.3 | 112.4 | 117.7 |
| Metals industrial group | 108.8 | 97.8 | 116.7 | 127.3 | 123.7 |
| Paper and pulp | 132.4 | 142.6 | 131.2 | 133.3 | 134.2 |
| Rubber and its products | 89.0 | 107.7 | ..... | ..... | ..... |
| Shipbuilding | 95.8 | 102.1 | 141.0 | 114.6 | 120.8 |
| Stone, clay and glass | 142.0 | 159.0 | ..... | ..... | ..... |

## ELECTRICAL WORLD *Barometer of Industrial Activity in the Western States*



These data are compiled by ELECTRICAL WORLD and are based on monthly consumption of electrical energy by 400 large manufacturing plants in various industries, and scattered throughout the section

*States in the* WESTERN GROUP

Montana,
Idaho,
Wyoming,
Colorado,
New Mexico,
Utah,
Nevada,
Washington,

## *Effect of Regulation in Pennsylvania*

THE situation at Washington as it affects electric public utilities moves slowly onward toward investigation. Senator Walsh, although at present well occupied in directing the inquiry into the Teapot Dome oil scandal, will before long in all probability employ his skill and legal talents on the public utility industry. That he will be able to uncover anything approaching in flagrance the oil scandal is improbable. Compared with the oil inquiry, the proposed inquiry into the public utilities and holding companies is bound to be disappointing to those who seek sensation. Why this should be so may be inferred from the general reputation and performance of the industries concerned.

There is a suspicion that state regulation is ineffective. Certainly, it is not what it ought to be in some states; but that is no reason why the federal government should, if it could, intervene. The utilities are well regulated in many states, Pennsylvania among them, and one has but to review what has been done in these states in the interest of the consuming public to be assured of the competency of regulation properly applied. The charge that state regulation is ineffective was scotched in the course of the Senate committee hearings by commissioners from Wisconsin and Pennsylvania. Nevertheless, it is well to have on record the facts against which the charges could not prevail. Judge Ainey, chairman of the Pennsylvania Public Service Commission, gave them. They vindicate the judgment of the Commonwealth of Pennsylvania in establishing regulation, prove its value, and, though self-praise is absent, they inferentially testify to the ability, the public spirit, the broad outlook and the grasp of the philosophy of utility regulation that characterize the man whom that state is so fortunate as to have at the head of its commission.

## *Notable Telephonic Feat at Institute Convention*

EPOCH-MAKING feats in the art of communication have followed one another so closely that they are losing their power to thrill the layman. Only technical men can appreciate the advance in the art which makes possible the joint meeting of the American Institute of Electrical Engineers and the British Institution of Electrical Engineers to be held next week. An audience in America and another in England will hear a program rendered partly here and partly across the ocean. This event follows four years after a joint meeting of the Institute in New York and Chicago which was extraordinarily successful. Where a thousand miles of land was bridged four years ago, three thousand miles of land and ocean will be leaped this year. It is a tremendous step forward; yet communication engineers have not ceased their efforts, and four more years may bring similar joint meetings wherein sight will unite with sound to annihilate space and time.

The electrical industry will do well to applaud its engineers. Quietly and modestly they are constantly building and expanding their art and their industry. At the meeting next week they will present noteworthy papers and will discuss current problems with knowledge and power. In all this they make no attempt to attract the attention of the general public or even of the industrial world, yet many very important developments may be announced which would be of interest to the world at large. The industry could well afford to give the engineers a press agent.

* * * *

## *Commercial Foresight in the Irish Free State*

POWER companies and electrical manufacturers in the United States in the past few weeks have had as their distinguished guest Dr. Thomas A. McLaughlin, managing director of the Irish Free State Electricity Supply Board. Dr. McLaughlin has charge of the Shannon River hydro-electric development in Ireland, which will begin operation next year with 90,000 electrical horsepower, later to be increased to 180,000 hp. His visit, however, is not being made primarily to study the benefits of interconnection, of consolidation of properties, or even of our most ambitious engineering projects. The economic advantages of American practice in utility operation, he believes, are well recognized and will be followed generally in Ireland.

Dr. McLaughlin's problem is a commercial one. He has been here to study methods of load building, and most particularly those for the residence customer. He is carrying back to Ireland with him many ideas for selling plans, advertising and publicity which he expects to put in use. But, of equal importance, he has seen and profited by some of our commercial short-sightedness, and of this not the least part has been the failure to provide sufficient capacity in the customer's service. Dr. McLaughlin declares that every house to be supplied with electricity by his project must be so wired as to carry a load of at least three kilowatts and preferably six. This is indeed a wise policy when it is considered that fewer than 20 per cent of the houses in even the largest cities of the Emerald Isle are yet wired. Five or ten years from now the electrical industry in Ireland will not be struggling with the problem of inadequate wiring as the power companies in America are now doing. Furthermore, Dr. McLaughlin is attacking the problem of load development even before there is any hydro-electric power available from the Shannon River. Another wise move. Had the American electric utilities been blessed some ten or twenty years ago with such foresight as is displayed by the Electricity Supply Board of the Irish Free State, there would now be more selling and less worrying about commercial development in the industry.

## A Suggestion to Self-Appointed Fuel Administrators

IN CERTAIN districts a citizen is not permitted to use electricity for fuel. A mile away another citizen served by the same electric utility and getting his energy from the same primary circuit is urged to cook and heat water electrically. This rationing of energy and control of its application are not based upon anything that has to do with generation, distribution or rates, but is governed solely by the length of a gas main. If the gas main reaches the citizen's frontage, electricity is not available to him for cooking.

The fact and what lies behind it are both too obvious to escape the attention of those whose business it is to be unpleasantly inquisitive. For the people—who regulate and largely own the utilities—are supposed to be all treated alike, and, after all, what is best for the public is best for the utility in the long run. Some combination companies have already put this principle into practice. Many have not.

## Innovations in High-Pressure Boilers

HIGH-PRESSURE stations are coming into vogue rapidly, and more than thirty are now in operation in various parts of the world. In this country eight or ten installations of 1,200-lb. boilers are recorded, and it is reasonable to assume more will come into existence. A plant operating on a low load factor finds a combination of high-pressure turbine and moderate-pressure turbine to be very economical.

The use of these high pressures has influenced boiler and turbine design and many innovations have been made recently. The Edgar and Lakeside station boilers are of about the same construction as lower-pressure boilers with the exception of the forged-steel drums. But the Sulzer, Bradford, Löffler, Atmos and Benson boilers are innovations and depart from customary boiler designs. Stations embodying these new designs are in operation in Europe, and it is reported that all operate successfully. But the largest of these installations produces only about 50,000 lb. of steam per hour, and much development must occur before it can be said the new designs will meet American requirements. In this connection it should be said that normal-design high-pressure boilers of the type used in the Edgar and Lakeside stations have proved themselves satisfactory in operation, and a new installation of a 10,000-kw. high-pressure and a 30,000-kw. normal-pressure combination unit in the Edgar station has been ordered.

Probably the most interesting development in boilers is the attempt to generate steam from water at the critical pressure of 3,200 lb. and a temperature of 706 deg. F. This type of boiler is called the Benson boiler and is being developed and applied in Germany. The high-pressure steam is superheated and throttled to give steam at 1,500 lb. and 850 deg. F. temperature to a turbine. Existing installations of this type of boiler in England and in Germany have performed very well but are of small rating.

Developments in boiler design should be encouraged, but the operating savings inherent in high-pressure installations must be measured chiefly in a reduction in fixed charges. Less material, higher unit ratings, smaller station volume and other installation advantages must be brought about before fixed charges can be lowered. In due time the cost factors involved in the newer type of boilers will be known so that these proposed units may be measured as to their economic possibilities for wide-scale application to power generation. Technical developments must take precedence now, but the ultimate gage is a reduction in fixed charges.

## The Cambridge Rate Cut

ANOTHER drastic rate reduction has been ordered in Massachusetts. In the Cambridge Electric Light Company's case the maximum rate of 8 cents per kilowatt-hour has been slashed to 5½ cents by the Department of Public Utilities, with the alternative of permitting the company to establish a schedule consisting of a service charge of 50 cents per month and a net maximum rate of 4 cents per kilowatt-hour for domestic and commercial lighting. At this writing the company has not announced its course, but, apart from the effect of the decision upon the affairs of this particular property, the finding is important to light and power companies in general.

It is the province of the courts rather than of the ELECTRICAL WORLD to determine whether any commission finding is confiscatory or otherwise, if that issue be raised, as in the pending Worcester Electric Light Company case in the federal arena. The Cambridge company maintained that its rate base should be $8,035,469, determined upon the reproduction-cost-less-depreciation method, and that its residential and commercial lighting allocated bases should be $2,224,175 and $1,451,349 respectively. On the basis of its 1926 earnings, the company set forth that a total of $664,848 was available for return, surplus and contingencies, or 8.274 per cent on the total base. The corresponding returns available on the residential lighting and commercial lighting base pro ratas were 6.539 and 17.189 per cent.

As in its Worcester decision, the commission in its computations of what it considers a fair return named a sum intermediate between the reproduction cost of the property less depreciation and the book cost. A majority of the board finds that, "so far as it may be material," the fair value of the property for rate-making purposes, "based upon the principles enunciated by the Supreme Court of the United States in McArdle et al. vs. Indianapolis Water Company (272 U. S. 400)," does not exceed $5,500,000 and puts the fair value of that portion of the property devoted to domestic and commercial business (excluding power, street lighting and sales to other companies) at not over $2,500,000. The commission also comments upon the attractiveness of a 6 per cent return in Massachusetts for securities of this sort.

Even with the qualified phrase, the granting by a majority of the board of the petitioner's request that the commission should find the reproduction value less depreciation is significant to those who have been coming to see that the so-called Massachusetts regulative doctrine is less rigid than the industry has been led to believe in recent years. It now looks as though the issue between the commission and those who resist its rulings were crystallizing along economic lines. In its final determination, by whatever tribunal, the question of what is a reasonable return is an economic one, bound up with many factors, among which are quality of management, character of market for service, stability of territory, cost of money at the time of adjudication, hazards of climate, public relations, standards of operation, maintenance and others.

The importance of designing rate structures to serve class business equitably is great. Thus, in the Cambridge case, it is unfortunate that residential and commercial service should have been lumped together in the company's rate structure and so ruled upon by the commission. The former yields about one-third the latter in terms of percentage on base, and we cannot regard this practice as sound; in fact, it would be nothing less than deplorable if regulative commissions should generally make such group rulings, whether forced to do so by the legal status of rate structures before them or led to treat such unassimilable classes of customers *en masse*. Finally, it would be very much less disturbing to the industry if commissions deciding to order drastic rate reductions would spread them over reasonable periods of time. It seems too bad that the Massachusetts commission saw fit not to grant the Cambridge company's appeal to be allowed at this time to try out an optional rate of the inducement type in which an area charge was to be combined with a 3-cent energy rate, but we need not conclude that the cause of promotional rates is hopeless in the Bay State at this stage of regulative history.

* * * *

## *The Time Has Come to Spotlight the Outlet*

BEYOND all else in the residence field, the electrical industry needs more outlets, more convenient receptacles available for connecting appliances. There are no lack of domestic consumers of electricity, for 17,590,000 homes are wired and using the service. But because of the inadequacy of the wiring—the lack of outlets—there is little electrical equipment in these homes. People don't use things that are not convenient. It is the same with electricity. Electrical men must spotlight the outlet in their selling from now on.

The industry has been inclined to leave the sale of wiring up to the contractor. When the home is wired the contractor is supposed to show the owner where the outlets should be. But he doesn't do it. Nobody has been thinking in terms of adequate facilities in the past—not even power-company men. And a great many in the industry have been feeling that more outlets cannot be sold because of the cost. Now comes an idea that seems to point the path.

In casting about to find a way to sell additional convenience outlets, somebody hit upon the plan of selling them in combination with an appliance. The theory was that people often refuse to buy a heat pad or a toaster or some other device because they have no convenient outlet to which to connect it. They refuse to buy an outlet because they have in mind no particular appliance that they wish to use with it. Merchandise the two together, however, and the customer at once sees in her mind this desirable lamp or percolator in use connected right where she would like to have it—so much for the appliance and the outlet, so much for the appliance alone. The salesman stresses the combination and it sells, because all question of how to connect it is solved. Convenience is assured. And while the wireman is installing the outlet there comes the opportunity to sell several more. This plan is now being successfully followed in several cities.

The development of residence load waits on adequate facilities in the connected homes for the use of complete equipment. It is time electrical men stopped talking about the reasons why adequate wiring has not been sold and turned their minds to merchandising outlets. They must spotlight the outlet. And if they sell outlets with appliances, they not only build load—they automatically open up a vast market for wiring materials, appliances, fixtures, lamps and all the meters, transformers and other equipment that will be needed to provide the capacity for carrying the load.

## *Uniformity in Street Lighting*

STANDARDIZATION in street and highway lighting is proposed in Great Britain. A national agency is suggested which will specify types and kinds of lighting for the country as a whole in order to eliminate the present chaotic conditions. The plea is that safety considerations make it imperative to call a halt on installations which reflect individual opinions and which do not conform to other installations.

Some constructive work should be done in this country along similar lines, but no one would venture to propose a national dictator on public lighting. Yet each city has suffered from the ebb and flow of street-lighting styles, and a lack of plan and co-ordination is obvious in all public lighting. Many large cities have made a fundamental plan for street lighting and some states have attempted to deal with highway lighting, but these projects have not been co-ordinated. It would be well worth the effort if a joint committee were to survey national conditions in lighting to find the facts and then outline a comprehensive plan for getting more uniformity and co-operation in street and highway lighting.

* * * *

## *Market Capacity Fixes Values*

MASS production is made possible by mass consumption. Many industries strive for volume in production by high-pressure selling in markets of limited consuming capacity. The result is harmful to their balance sheets. No situation of this kind exists in the electrical industry. The soft-coal industry, the steel industry and in some degree the automotive industry face an exploited market with uncontrolled and surplus production facilities. They are forced to use high-pressure selling methods and get their volume by reducing profit margins. But there is no market saturation facing the electrical industry. Whatever lack of balance exists is created by inertia in selling and by lack of co-operation between industry groups.

The homes, the factories and the railroads offer a present market for electricity and for electrical products equal to that now served. These markets should enable each group in the industry to get volume sales at a fair margin of profit if the industry is geared to sell. At present there is too much "buck passing." The manufacturers criticise the utilities and vice versa; too much effort is spent on competitive selling rather than market development; margins of profit are low because business expansion is not so fast as production expansion, and there is too little team play in selling efforts. The industry would do well to get behind the industry sales program recently started.

# Gaging of Mountain Snowfall Enables Forecast of Hydro-Electric Supply

Estimates by trained observers of winter-stored water power in the Cascades enable the forecasting of available resources in a warmer season. The Big Creek Power House No. 1 of the Southern California Edison Company also utilizes the melting snows.

# Average-City Street Lighting

Business aspects for central stations to consider.
Plans should be comprehensive. How to
sell street lighting. Results to be expected

By Thomas W. Rolph
*Managing Engineer Street Lighting Department, Holophane Company*

THE value of the street-lighting load to the central station is well recognized in the industry. Under equitable contracts, the business is profitable to the utility and the load is practically a constant one, usually contracted for in advance, to cover long periods of time. The revenue is assured in periods of depression as well as in good times and there is seldom any trouble due to poor credit. Meter reading and billing, which form so large an item in the usual cost of rendering service, are almost negligible in the case of street lighting. Perhaps the greatest advantage, however, is in the effect on the load curve. Of the 24 hours represented in a daily load curve, street lighting will run through an average of eleven, and these eleven hours cross the lowest valley in the curve.

It is, therefore, generally recognized that the central station should take aggressive steps to develop the street-lighting business. It is further recognized that such development is not only to the advantage of the utility but is also a service to the public, because street lighting throughout this country today is far below the standards which present traffic conditions require for the safety and convenience of the public. The average annual city expenditure for street lighting (in cities of more than 10,000 population) is 92 cents per capita,* whereas "it is generally conceded that in the average American city an annual expenditure of not less than $2 per capita is justified by its returns in decreased accidents, decreased crime, increased convenience of urban life and increase in property values."†

### Three Reasons for Slow Progress

Yet, in spite of these facts, it must be admitted that street lighting moves forward at a disappointingly slow pace. With the need so clearly evident, it cannot be doubted that something is wrong with the selling activity. The lighting industry is not selling street lighting today as aggressively as the need calls for. Yet there are many salesmen and commercial engineers working on street lighting throughout the United States. Why is the result so small compared with the possibilities? A careful consideration of this question leads to the belief that the lack of more rapid progress is due to three things, as follows:

First—Lack of a definite and complete street lighting plan for each community.

Second—Lack of aggressive leadership in each community

Third—Lack of co-operation on the part of the factors in the industry who are interested in street lighting.

It would seem that the central station should take a position of aggressive leadership in each city which it serves and see that a plan is drawn up by some competent engineer for a complete and fully adequate street lighting system. The various salesmen and commercial engineers working on street lighting would then find it to their interest to co-operate with the utility and to work definitely along the right lines toward this planned result, because it would be much larger and more comprehensive than any result which could be reached through their individual, separate activities. Wherever the central station will take an aggressive attitude and plan on a large scale there is little doubt that the ultimate street lighting result will be splendid and all parties concerned, including the city itself, will profit largely thereby. The size of the city and the character of its administration will have a bearing on the exact procedure. Cities of moderate size where the central station is now supplying the street lighting offer one of the best fields for sales activities, which should increase the street lighting load by a handsome percentage within a very few years.

### Need Competently Engineered Ultimate Plan

The first step for the central station is to demonstrate "the desirability of each community adopting a competently engineered 'ultimate plan' definitely establishing all physical elements of a street lighting system which will provide adequate street lighting service, including satisfactory appearance, at the minimum cost consistent with such service."‡ It matters not how visionary this may seem. The entire plan on a scale fully up to modern requirements is the first thing to be worked out and set as a goal. Then every street lighting project which arises in the community should become a definite part of this comprehensive plan and fit into it perfectly. The science of street lighting has developed to such a point that it is now possible to design a fully adequate street lighting system for an entire community on such sound engineering principles that the essential features of the system will stand for many years to come. Even if it will take three years or five years or longer to install the complete system for the city, its general engineering features can be planned definitely and adequately right now.

In some cases the city engineer can well prepare the plan, working with the central-station engineers; in

---

**Weighted average figure from values given in "A Survey of Street Lighting Practice in the United States," by Dr. J. Franklin Meyer of the U. S. Bureau of Standards, Transactions I.E.S., January, 1925.*

*†Quotation from July, 1927, serial report of the street and highway lighting committee of the National Electric Light Association.*

*‡Quotation from July, 1927, serial report of the street and highway lighting committee of the National Electric Light Association.*

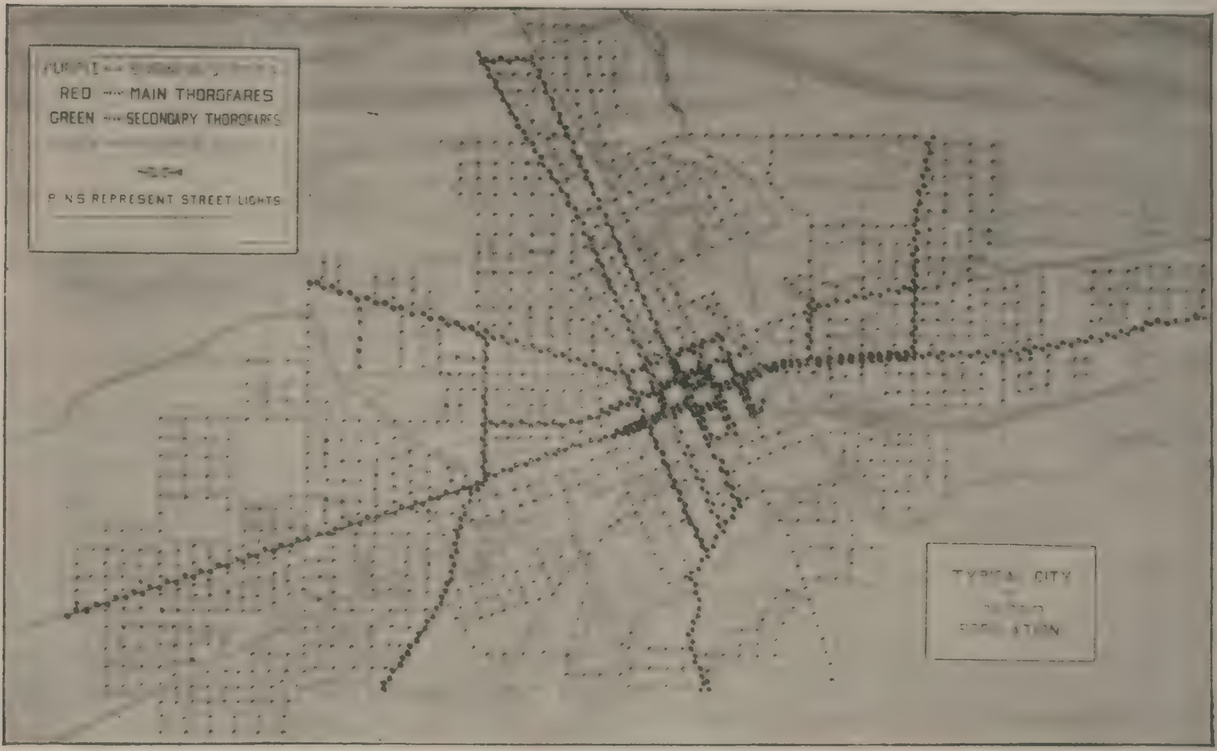
other cases it will be desirable for the central station to take the initiative and make the complete layout subject to the approval of the city engineer.

The first step is to take a map of the city, preferably on a scale of 500 ft. to the inch or larger, and mount it on a board so that colored pins can be used to indicate locations of street lights. Before starting on the street-lighting layout, the various classes of streets should be indicated in colored crayon on the map. First outline the central business district and mark in one color all the streets in this district. Next, lay out the main thoroughfares, marking them in some other color. In many cases these have been definitely fixed by local authorities or by the state highway department as part of certain through state routes. Some city officials or the local automobile club will often have the authoritative information on these main thoroughfares. If the city is of more than 15,000 population there will usually be secondary thoroughfares also which should be marked in a third color. The primary thoroughfares carry traffic from main interurban automobile routes into the city and out again; secondary thoroughfares carry traffic from the central part of the city into the residence districts, but do not form a part of main through routes. Secondary thoroughfares also include lateral connecting links between different parts of the city. In this connection it is useful to remember that the ideal city plan, as far as traffic is concerned, is very much on the order of a spider web. From the central business district radial thoroughfares go out in all directions, some (main thoroughfares) to the state routes and some (secondary thoroughfares) only to residence sections and the surrounding country. At certain distances out from the center of the city there should be lateral connecting links (secondary thoroughfares) between the radial thoroughfares. Few cities today approximate these ideal conditions,* because most of them were laid out before the days of rapid traffic and scientific city planning, yet the spider web layout should always be kept in mind as the ideal when fixing the arteries of traffic for a city.

In the typical city of medium size there will be these four classes of streets:

Primary business streets.
Primary thoroughfares.
Secondary thoroughfares.
Residence streets.

There are also alleys, parks, etc., but these need not be considered at present. In the larger cities there will be secondary business districts also. Often these will be a part of the thoroughfare system and can be taken care of by the thoroughfare lighting. Sometimes they require ornamental treatment somewhat similar to the primary business streets.



GENERAL PLAN FOR A CITY STREET-LIGHTING SYSTEM

Having classified the streets of the city the next step is to lay out a definite street-lighting system for the entire city. Here it is essential that the illuminating engineer of the central station should do a thoroughly creditable piece of work. If the central station has no illuminating engineer competent to handle this outside engineering talent should be secured. The best is none too good, because the engineering of a complete street-lighting system is a fairly complicated proposition and the plan, when completed, will form the basis for large sales activities and line extensions.

The lighting layout should be fully adequate so that the city will have a system to be proud of. At the same time the cost must be checked carefully and the character of the installation in each part of the city

---

**Washington, D. C., and Indianapolis, Ind., are notable exceptions.*

adapted to what is a reasonable expenditure. In most cities it is impracticable to consider extending an ornamental system throughout the entire city within the next one or two decades. There are occasional exceptions to this, but usually, when such a large ornamental program is attempted, the progress of the installation will be so slow, under its cost handicap, that a large part of the city will remain inadequately lighted for many years to come, to the detriment of the city's interests and the central-station revenues. Ornamental lighting should always be provided for the business district and should be carried as much farther throughout the city as is practical. It should always be borne in mind that the interests of the city and the interests of the central station are concerned primarily with supplying a fully adequate amount of light properly distributed on every street throughout the entire city.

Anything which interferes with obtaining fully adequate lighting on every street, or which delays progress toward such lighting, works directly against the interests of the central station, for the reason that it has an unfavorable effect on the street-lighting revenue and works directly against the interests of the city, because it prolongs the time during which the public must put up with unnecessary traffic accidents, crime and inconvenience.

When the street-lighting system has been laid out from the illuminating engineering standpoint it should be checked carefully with the electrical engineer or superintendent of distribution. Close co-operation should prevail between the illuminating engineer and the distribution department. The final result should be satisfactory to both departments.

When the final plan is completely worked out the central station is ready to begin its real sales activity. The plan should be discussed with city officials and prominent citizens and as many of them as possible should be sold on the idea of working toward such a plan for the lighting of the city.

All of this activity is particularly appropriate when the street-lighting contract is due to expire within the next year. At such a time there is an opportunity to have the complete street-lighting plan adopted as the basis for a new contract. If the program seems too large to the city the new contract could provide for the installation of the complete system on a program which might run from two to five years.

Even when no new street-lighting contract is contemplated it is desirable for the central station to have the complete plan worked out as the basis for its street-lighting sales activities. Regardless of the contract period, a city which recognizes the situation clearly should find it possible to adopt some program of improvement, in order to attain the character of street lighting which modern traffic conditions require. When the city administration is indifferent it often happens that groups of merchants or residents are only too glad to help push through new street-lighting projects and often to finance them. These should always fit in and form a part of the complete "ultimate plan" for the city.

### STEP-BY-STEP PROGRAM

It is important for the central station to direct its sales activities toward those parts of the city which promise the largest immediate returns consistent with carrying out the complete program. A typical case is therefore considered here, in order to show what street-lighting load can be expected from the various parts of the city when the complete ultimate street-lighting system is in service.

The map illustrated herewith shows the complete plan for a typical city of 35,000. Classification of the streets of this city discloses the following distribution:

| | Miles | Per Cent |
|---|---|---|
| Main business streets | 2 | 2.2 |
| Main thoroughfares | 7 | 7.6 |
| Secondary thoroughfares | 8 | 8.7 |
| Residence streets | 75 | 81.5 |
| Total | 92 | 100.0 |

The following shows the average illumination values which should be provided throughout such a city in order to meet modern standards:

| | |
|---|---|
| Main business streets | 0.7 foot-candles |
| Main thoroughfares | 0.5 foot-candles |
| Secondary thoroughfares | 0.3 foot-candles |
| Residence streets | 0.08 foot-candles |

No city of moderate size can be called completely lighted today unless the streets throughout the entire city are supplied with average illumination values at least as high as the above.

The layout of a street-lighting system to give this illumination is shown in the accompanying illustration. It is believed that this system is fairly representative of the best illuminating engineering practice of the day. The mounting height is not less than 20 ft. on any street. The spacing is approximately eight times the height on the business streets and thoroughfares and approximately twelve times the height on the residence streets. The general characteristics are:

*Business Streets*—Twin-light standards, ornamental upright units, height to light center 22 ft., spacing 165 ft. opposite system, 6,000-lumen lamps, type B asymmetric light distribution, underground service.

*Main Thoroughfares*—Simple ornamental standard with 6-ft. bracket arm, pendent unit, height to light center 20 ft., spacing 150-ft. staggered system, 15,000-lumen lamps, type B asymmetric light distribution, underground service.

*Secondary Thoroughfares*—Same as primary thoroughfares except using 10,000-lumen lamps.

*Residence Streets*—Pendent units suspended over center of street, height to light center 25 ft., average spacing 300 ft., 4,000-lumen lamps, four-way and two-way light distributions, overhead service.

The lighting system will require the following amounts of energy, not including line and transformer losses:

| | Kilowatts | Per Cent |
|---|---|---|
| Business streets | 81 | 12 |
| Main thoroughfares | 190 | 29 |
| Secondary thoroughfares | 148 | 23 |
| Residence streets | 236 | 36 |
| Total | 655 | 100 |

This indicates that when a typical city of medium size is properly lighted the central station can expect 12 per cent of the street-lighting revenue from the business district, 29 per cent from the main thoroughfares, 23 per cent from the secondary thoroughfares and 36 per cent from the residence streets.

At the present time few, if any, cities can claim to have lighting of this character. In many cities of moderate size the business district is up to the standard here given. In a few cities the thoroughfares are well lighted, but practically no cities have the above standards of illumination supplied throughout the entire city. There is, therefore, a great deal of sales work to be done on street lighting in order to bring practice up to present-day requirements.

Of the street-lighting sales work which is at present being carried out the greater part is conducted by manufacturers of street-lighting equipment. Most of this effort is placed on the sale of ornamental street-lighting equipment for business districts. A certain amount is directed toward thoroughfare lighting and a still smaller amount toward residence street lighting.

This indicates that the central station is not benefiting to the maximum degree by the present sales efforts in street lighting. Most of these efforts go into a field where the central station can expect only 12 per cent of its ultimate street-lighting load. Some of the sales effort is directed toward a field where the central station can expect an additional 52 per cent of its street-lighting load and very little effort in the field where the central station can expect the other 36 per cent of its ultimate street-lighting load.

Considerations of good business will dictate that the central station direct its sales efforts toward the fields which promise the greatest and most immediate financial returns. This does not mean that the sales effort now going on toward business district street lighting should be discouraged in any way. Such effort is useful and helps to build up central-station revenue. However, since this portion of the street-lighting field is so well covered by sales effort today and since it promises such a small percentage of the ultimate income from street lighting it would seem desirable for the central station to center its main sales activity first on the proper lighting of thoroughfares and second on the proper lighting of residence districts. In that way the street-lighting load of the central station can be built up most rapidly and the interests of the public in obtaining adequate street-lighting service will be well served.

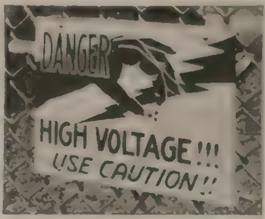
## Conveyor Oven Bakes 2,000 Loaves of Bread Per Hour

ONE of the largest electric bread baking ovens to be served by the Utah Power & Light Company is the oven recently installed in the American Lady bakery, Salt Lake City. The oven is approximately 55 ft. long and 8 ft. wide and has a connected load of 220 kw. Automatic temperature control maintains the proper baking temperatures. The instruments mounted above the center of the oven indicate operating conditions at all times, enabling desired conditions to be maintained day after day, one year as well as another.

# Safety Practices

By N. E. Emmons
*Superintendent of Maintenance Utica Gas & Electric Company, Utica, N.Y.*

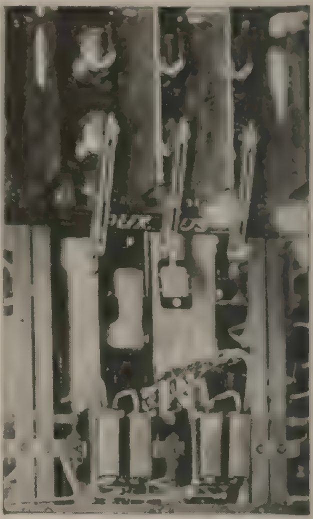
SAFETY IS the major consideration of the maintenance department of the Utica Gas & Electric Company. To eliminate possible operating errors a policy of detailed protective designation has been adopted for all work involving any potential hazards. In the generating and substations, for example, barriers between line and phase conductors are so painted that there can be no possible visual error in opening disconnecting switches which may not have been de-energized. Bright red coloring is used between individual line services. Oil circuit breaker-operating control positions are carefully labeled and each line is properly marked. In outdoor substations the signs are of such proportions that even in a poor light exact information as to line designation, operating arm position, etc., is clearly evident.



*Danger sign for public warning*

This sign is designed to warn those who cannot read, those whose eyesight is less keen than the average, and heedless trespassers.

There are two types of signs for high-tension structures. This one is of the public type. The brilliant red hand, jagged flash and white death's head carry a bold, arrestive warning.



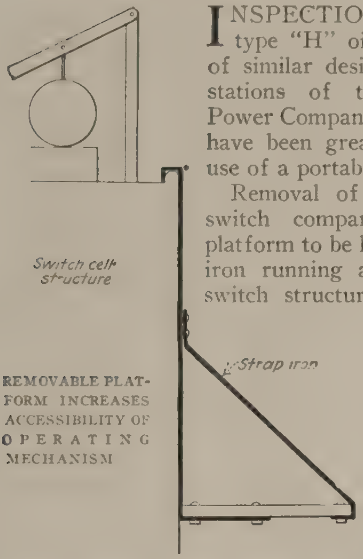
*Safety card holder for open disconnecting switches*

A Bakelite plate of brilliant crimson is attached to the free end of the movable blade of the switch. Under working conditions, all three disconnects would have this safety card holder clamped on to them. A red stripe is painted on the potential transformer fuse block about 2 in. from the bottom. This is put on the block that is on the solidly fused ground leg of the potential transformer, so that, in removing and replacing these fuses, a solid block will not be put on the live leg in place of the fused one. A black triangular strip of wood is installed on the switching structure directly underneath the disconnects and stenciled with the particular designation of that circuit so as to eliminate a switching error. This designation is also shown directly above the oil switch handle, but does not appear in the illustration.

Control cabinets are in many locations a source of possible confusion, as the proper indication cards are either lost or, through procrastination, are never made up. This company insists that switch designations be painted on the control panel doors opposite to and in line with the switches to which the information applies when the doors are in an open position. All circuit breakers are tagged when removed from service and each disconnecting switch blade is provided with a Bakelite marker of ample proportions, which prevents the closing of the disconnect, unless the marker is removed. It is required that all disconnecting switches be grounded by means of a clipped cable, ground clip and attaching pole before any work may be undertaken on such devices.

Protecting the public from the potential dangers involved in utility properties is undertaken by means of large-lettered signs of high visibility, which are fastened to the fences and gates surrounding outdoor substation structures, are placed on the doors of substations and are attached to the base of transmission towers where there is any possibility of public trespass.

## Oil Switch Maintenance Aided by Portable Platform



REMOVABLE PLATFORM INCREASES ACCESSIBILITY OF OPERATING MECHANISM

INSPECTION and maintenance of type "H" oil switches and others of similar design, in the plants and stations of the Northern States Power Company, Minneapolis, Minn., have been greatly facilitated by the use of a portable platform.

Removal of the doors from the switch compartments permits the platform to be hung from the channel iron running along the top of the switch structure. The maintenance man may then work on the operating mechanism comfortably and without bending over. The length of the platform is such that its ends rest against the concrete partitions separating the two outside phases of the switch under inspection from those adjacent. The platform is about eighteen inches wide. The support-brackets at each end are made of ¼-in. strap iron 1½ in. wide.

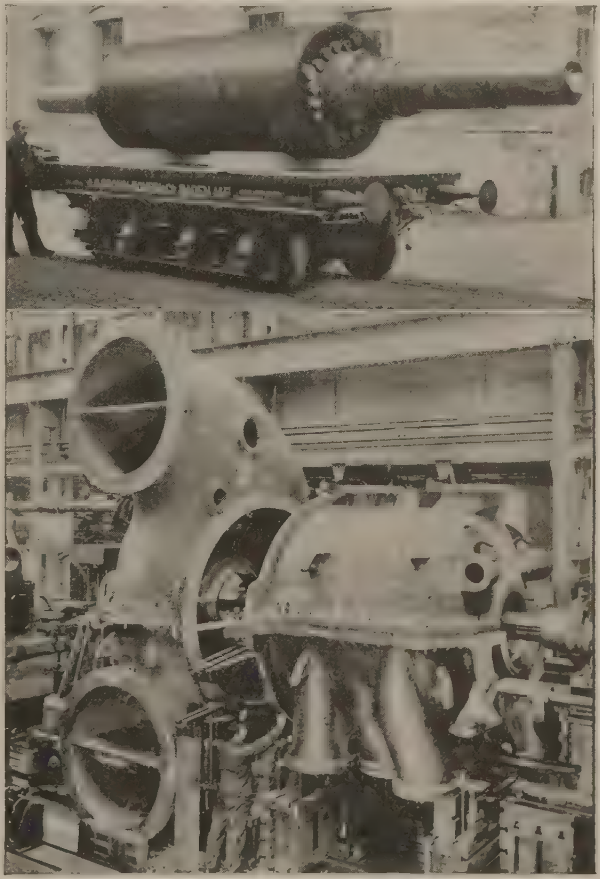
## The Sledgehammer Test for Source of Radio Interference

THE combination of the sledgehammer with the delicate sensitivity of a radio-receiving set is sometimes very efficacious in locating faults which figure as sources of radio interference. Two such instances are reported by C. P. Edwards, director of radio service of the Department of Marine and Fisheries, Ottawa, Canada. The technique of the test consists in striking the bases of poles with the hammer while the radio trouble man listens in with his portable set and notes whether the effect of the blows is indicated by any change in the character of the interference. This test is not made until the fault is localized in a definite and rather small area. Both of the cases here encountered occurred in the city of Ottawa.

In the first case the radio investigator had traced the interference down to a definite area and he then noticed that when one particular pole was struck the interference increased tremendously. A lineman was sent for and a demonstration of the interference was arranged for his benefit. But this time the pole was struck a little too hard and instead of the interference resulting, the primary cutout of the transformer on the pole fell to the ground, narrowly missing the lineman's head. It was found that the contact jaws of this cutout were badly burned due to continuous arcing. It was reported that during the time this transformer was dead, while the cutout was being replaced, all radio interference was absent in the district, proving beyond doubt that this was the source of the reported trouble.

In the second instance it was noticed that the response in the radio receiver was about the same when any pole within a length of four spans was struck with a sledgehammer. This was evidently due to the fact that the vibration from the blow of the hammer traveled along the wires from pole to pole. Repeated tests, in which the strength of the hammer blow was decreased each time, finally narrowed the fault down to one pole. The lineman then climbed the pole and very gently shook the different wires, finally locating the loose connection in one of the transformer cutouts, the clamping screw of which had become loosened. This fault was found as the result of an investigation lasting about one hour and a half and it included the test of about 30 transformer poles. The users of the radio sledgehammer test believe it to be the most economical method known for locating faults of this nature.

## New York's 160,000-Kw. Turbo-Generator in Manufacture



PARTS of the 160,000-kw. turbo-generator which is being made for the Hell Gate station in New York City are shown at the manufacturer's plant in Switzerland. The top view portrays the 85,000-kva. generator rotor and that below shows sections of the high-pressure cylinder being bored. The illustrations were furnished by the United Electric Light & Power Company.

# Reducing Distribution Losses

SEVENTH ARTICLE

## *Load and Voltage Tests*

By J. B. Moorhouse
*Electric Distribution Engineer Central Illinois Public Service Company, Springfield, Ill.*

THE REDUCTION of transmission and distribution losses requires a considerable amount of testing with electrical instruments. Few instruments can be conveniently carried about for general testing, so that a wide variety of such devices is not usually available and a careful selection of instruments must be made.

Graphic instruments should be readily portable, light in weight, accurate and sturdy. Charts must be continuous if the instruments are to be used for general purposes. Twenty-four-hour circular charts have many uses, but are not satisfactory for general load and voltage checking. Instruments with continuous charts driven by eight-day clocks are found most convenient. Permanence of calibration is not to be expected of portable graphic instruments and a high-grade, indicating, voltmeter-ammeter scale, 0-150-300 volts and 0.5 amp., must be carried as part of the graphic equipment for calibrating purposes. A double-range instrument usually costs as much as two single-range instruments, but is less cumbersome to carry about than two instruments.

CARRYING CASE FOR STANDARD GRAPHIC AMMETER. THE VOLTMETER CASE IS SIMILAR BUT OF DIFFERENT DIMENSIONS

A graphic voltmeter with ranges of 90-130 and 180-260 volts is usually best for general voltage survey testing. This instrument is only slightly heavier than a single-range instrument. A graphic ammeter, range 0.5 amp., when used with a multi-range current transformer, is desirable. The current transformer must be compensated as nearly as possible for the exact burden of the graphic ammeter. The compensation, if secured by removing turns from the secondary winding, will be correct for all ranges. For checking loads on distribution transformers a special current transformer with ranges of 25-50-100-200 amp. is found most convenient for average conditions, the 200-amp. range being sufficiently high for checking a 37½-kva. transformer.

For convenience in mounting instruments on poles a weatherproof steel box with two padded compartments for instruments has been found very satisfactory. The steel box also serves as an excellent carrying case when transporting the instruments from pole to pole and from town to town. Connection is made between the instruments in the box and the line with a multi-conductor cable fitted with proper lugs and clamps. The box is supported by means of a steel chain wrapped around the pole.

If proper instruments are selected and all equipment is prepared for universal service before it is sent out of the shop time losses in the field may be avoided.

# New Hydro-Electric Development Survives Flood

THE hydro-electric development under construction for the Burlington (Vt.) Light & Power Company by the U. G. I. Contracting Company, Philadelphia, at Winooski Gorge came through the great flood of Nov. 4 last without material damage, despite the conditions shown in the accompanying illustration from a photograph taken about at the peak of the deluge. This 3,000-kw. development is being made at the left of the rock wall around which the flood is surging and the reinforcing steel for the penstock roof was in place at the time of the flood and remained in position until after it had subsided.

The flood reached an elevation 27 ft. above the dam crest. The railroad bridge below the Gorge was destroyed. The side walls of the penstock had only just been poured and this green concrete was called upon to take very severe erosion, with the result that it was somewhat pitted. The penstock forms remained in place throughout, but the centering was swept away. After the flood this centering was replaced, but was again cleaned out by a second and smaller flood. The superstructure of this plant has been designed with the object of permitting passage of floods over it without injury and of enabling operations to continue even up to a flow of 50,000 sec.-ft.

CONSTRUCTION WORK ABOVE RAILROAD BRIDGE WITHSTOOD FLOW THREE TIMES THE MAXIMUM FOR WHICH DESIGNED

Studies have been conducted involving a comprehensive ultimate development at this point requiring the eventual demolition of the old belt and countershaft Gorge plant, the installation of floodgates in the channel and the raising of the head 10 or 15 ft. with the addition of two 3,000-kw. units adjacent to that now being placed.

# The Boulder Canyon Project

Events which brought it before Congress. Engineering objections to the proposal and reasons why further engineering study of the flood control problem of the lower Colorado are needed

BOULDER CANYON is in the limelight in Congress and the following digest of the project should be read by electrical men:

The proposed Boulder Canyon project includes:

(a) A dam in the Colorado at Black Canyon, not far from Las Vegas, Nev., creating a reservoir with a storage capacity of 26,000,000 acre-ft., estimated to cost $41,500,000.

(b) A power house with 1,000,000 hp. of installed capacity, estimated to cost $31,500,000.

(c) The All-American Canal, estimated to cost $31,000,000.

The estimated period of construction is five years. Interest at 4 per cent during this period would amount to $21,000,000 and would make a total project cost, as estimated by the Department of the Interior, of $125,000,000.

The proposed dam would be 677 ft. from foundation to crest, 550 ft. above water level and 127 ft. below. The length of the dam at the crest is 900 ft. It would contain 3,750,000 cu.yd. of concrete. The firm power developed by the project would be 550,000 hp., as it is estimated that the project can be operated on an annual capacity factor of 55 per cent. The reservoir would be about 100 miles long and cover about 125,000 acres.

### PURPOSES OF PROJECT

The All-American Canal would be located just north of the Mexican boundary, starting from the Laguna Dam in the Colorado at Yuma, Ariz., and leading to the Imperial Valley in California. It would replace, so far as American farms are concerned, an existing irrigation canal, which begins in American territory below Yuma but traverses 60 miles of Mexican territory. The existing canal irrigates about 400,000 acres in the United States and 200,000 in Mexico. This acreage is definitely limited by the present low water flow of the river. In the United States any material increase in acreage of irrigated lands from the present canal would require the introduction of pumping plants to raise the water to higher level canals. The proposed All-American Canal would irrigate by gravity an additional area of at least 400,000 acres. It would, however, traverse an area covered by high and shifting sand dunes and would thus be expensive to dig and maintain.

The purposes of the combined dam and canal project are:

(a) The generation of electric power for sale.

(b) Increased irrigation in the Imperial Valley and freedom from Mexican control of the canal.

(c) Flood protection for the lower Imperial Valley.

(d) The furtherance of a solution of the water supply problem of Los Angeles and other cities of southern California by making available in the Colorado stored and desilted water, and by supplying power for pumping requirements along the aqueduct under contemplation.

The moving impulse that led Congress to direct the Reclamation Service to make a study, which resulted in the proposal of the Boulder Canyon project, came from the Imperial Valley in California. The various groups in the valley aimed at four major objects: Flood control, increase of low water flow gravity, supply of water for irrigating additional lands, and a canal free from Mexican territory. The last two objects are to be accomplished by the All-American Canal. It has no physical relation to the first two. It will neither increase the low water flow nor reduce the flood menace. It is not, therefore, of primary importance to the owners of the developed lands in the Imperial Valley, but in the minds of many it has become a large desideratum and so has been tied to the flood control project.

The Reclamation Service itself, when called upon by Congress to study the problems of the Imperial Valley, was strongly predisposed toward an All-American Canal because it had built the Laguna Dam in the Colorado as a part of the Yuma reclamation project, which project was hopelessly weighted down with debt, and it was recognized that if Laguna Dam could be utilized by the Imperial Valley people, part of the cost of the dam could be charged against them and the Yuma project helped out of bankruptcy. The All-American Canal, though having nothing to do with the flood control problem, thus became solidly established as a part of the undertaking, and its high cost profoundly affected the solution of the problem as finally proposed by the Reclamation Service.

A $31,000,000 canal tied on to a $15,000,000 flood control dam would look out of all proportion. The tail would seem to be wagging the dog and Congress would demand that the two items be separated and each judged independently. This consideration, together with the then existing favorable relation of hydro to steam-power costs and the rapid growth of power consumption in southern California, naturally led the Reclamation Service to dismiss any idea of a simple flood control dam and to look instead for a high power dam capable of producing revenues sufficient to pay for all, or at least a large part, of the cost of the entire undertaking. This idea was subsequently seized upon by the then comparatively new Municipal Electric Bureau of Los Angeles. Further impetus was added by the proposal of that city to augment its domestic water supply by the diversion of 1,500 cu.ft. per second from the Colorado.

The present support for the Swing-Johnson Boulder Dam bill comes from "municipal ownership of power" enthusiasts, from water supply advocates for southern California, from those with selfish interest in a government construction program of $200,000,000 and from the flood-menaced people of the Imperial Valley.

### FALLACIES THAT HAVE GROWN UP

As a result of misinformation and misunderstanding, certain fallacies have grown up in the minds of the public at large, whose knowledge of the subject must depend largely on newspaper publicity:

(a) It is believed that, at a not far distant date, Los Angeles will suffer for lack of drinking water unless Boulder Dam is built. As a matter of fact, the proposed Colorado River water supply for Los Angeles can go ahead entirely independent of the Boulder Dam. There is slight connection between the two. The proposed water intake of the aqueduct is to be located 220 miles below Boulder Dam and this water supply will require but a small amount of storage, amounting to less than one one-hundredth of the capacity of the Boulder Dam reservoir.

Claims are advanced that the Boulder Canyon reservoir is indispensable for the desilting of the heavy burden of mud always carried by the Colorado, so as to insure a clear stream at the aqueduct diversion, but the river, issuing from Boulder Dam more than 200 miles away, would once more pick up a new load of silt from the sediments of the valley bottom and so would arrive at the aqueduct laden with silt. For several score years ahead desilting works would have to be provided. The existence of Boulder Dam would have no vital effect on the silt problem of the aqueduct.

The water supply project will require 375,000 hp. for pumping, but Boulder Dam is by no means the only, or, for that matter, the best, source of power for this pumping. Unless this demand for power arises approximately when Boulder Dam power comes on the market, that power will be compelled by the weight of accumulating interest charges to take the first profitable outlet that offers itself. Later, when the pumping demand develops, it will naturally look elsewhere for a power supply if cheaper sources are to be found. If not, it will have to supplant other power markets by paying a price that will divert Boulder Dam power to it. There are sites on the Colorado where dams built solely for power purposes can produce cheaper power than Boulder Dam.

### ADEQUATE SUPPLY AVAILABLE FOR LOS ANGELES

As for the time when the need for this additional water will become pressing, the present water supply, together with the potential supply from the Mono Basin, will take care of a population of 4,500,000, or about four times the present. The proposed project would supply about 10,000,000 people, or eight times the present number. The pumping cost when this 1,500 cu.ft. per second is raised over a range of mountain with a combined lift of 1,500 feet along the 250 miles of aqueduct, even at a power cost as low as 3 mills per kilowatt-hour, including generation and transmission of 225 miles, will be on the order of $25,000,000 per annum, which is sufficient warrant for concluding that this pumping project is not near at hand. It will be many years before water will be pumped from the Colorado 250 miles to Los Angeles. This pumping load is too far ahead to be counted on as a market for Boulder Canyon power.

(b) It is understood that the All-American Canal is an integral part of the flood control project. As a matter of fact, there is no physical relation between the two; the relation is entirely political. At first the owners of developed lands in the Imperial Valley strongly opposed tying the All-American Canal to their flood problem. The agreement to pay back the cost of this canal to the government was the equivalent of mortgaging their land for about $40 per acre just to insure a water supply independent from Mexico. It was manifestly not worth it. Their attitude, however, changed when they observed the general success with which reclamation project settlers have defaulted on similar payments to the federal government.

(c) It is presumed that the sale of power and stored water will repay in about 25 years the cost of the entire project. As will be discussed later, because the elements of cost have been underestimated and the rate of return has been overestimated, revenue from the project will not earn interest on the investment, to say nothing of amortization of the federal bonds it is proposed to issue.

(d) It is assumed that there is no alternative to the Boulder Dam project. Other government engineers have pointed out another solution and have disagreed with the Reclamation Service as to the merits of their recommended dam site and proposed solution of the problem. The engineers of the Reclamation Service stand pretty much alone on this question.

### OBJECTIONS TO THE BOULDER DAM PROJECT—POLITICAL AND ECONOMICAL

The broad economic and political objections to the Boulder Dam project are:

(a) It proposes to put the federal government into the power business on a large scale as a means of producing revenue at the expense of, and in competition with, individual enterprise.

(b) It proposes to subsidize the power and water consumers of southern California at the expense of the federal treasury.

(c) It will provide a much larger low-water flow in the Colorado River. In the absence of international treaties to the contrary, and regardless of any agreements which might be made between the various states through which the river flows, it will permit a large irrigation development in Mexico. This presumptive right to water so used by Mexico will inevitably tend to restrict the development of the arid lands in the basins within the United States.

### OBJECTIONS TO THE BOULDER DAM PROJECT—ENGINEERING

The broad engineering objections to the project are:

(a) It does not fit in with the best scheme of development of the entire river for flood control, power and irrigation. Such a scheme requires large storage at or above the Utah-Arizona state line, so as to regulate the flow of the Colorado for power development in the canyon section below; a series of power dams of the most economical heights and at the most suitable locations, and a small reregulating reservoir at the foot of the canyon section for irrigation needs. Such a system would develop 5,500,000 hp., or 5½ times the amount at Boulder Dam. If this power is to be developed, Boulder Dam storage must be duplicated, thus necessitating a great waste of money and a needless loss of water by evaporation.

(b) The construction program will necessarily be so long that the flood hazard to the Imperial Valley will continue for many years.

If the arguments as to the imminent danger of the Imperial Valley are at all sound, it is needless to emphasize their force in advocating that program of relief which can be put through in the shortest possible period of time.

The detailed engineering objections to the project are:

(a) Storage on top of a very high dam is manifestly very expensive. If Boulder Dam were to be built as proposed, with the top 8,000,000 acre-ft. of storage devoted to flood control, it would soon be seen that the increased output in kilowatt-hours to be had by utilizing for power this lost head, at the rate of return estimated by the Department of Interior, would finance the building of an 8,000,000-acre-ft. flood storage reservoir located down on the ground at Topock near Needles, Cal., 100 miles below Boulder Canyon. In other words, if this whole undertaking is to be self-supporting, why not follow sounder engineering and build two dams, one strictly for flood control and the other solely for power production, unhampered by requirements that would seriously impair its ability to provide revenue. Two dams would be good engineering. It would be poor politics, because, once these two functions—flood storage and revenue—were separated, Congress would strike out the investment proposal and limit itself to a contribution to the flood control problem.

(b) The character of the river, of the dam site and of the proposed dam are such as to make the proposed construction hazardous and expensive. In the opinion of disinterested engineers the estimated cost of the dam will probably be exceeded several times and the time of construction will be lengthened twice or even three times.

During protracted construction, interest and sinking funds steadily accrue on bonds, and the resulting capital charges, arising from this greatly increased cost and the lengthened period of construction and development, grow to uncontemplated proportions.

(c) Because of the drop during the past five years in the cost of steam-generated power due to increased efficiencies, contrary to the estimates of the Reclamation Service, Boulder Dam will not carry on its back the cost of the All-American Canal nor will it carry the cost of the flood control storage. Even stripped of these two loads, it would still be an unsound investment as a power project because of the character of the dam site, the size of the dam, the large block of power to be absorbed, with a market many miles away, and the telling effect of the competition of low-cost and reliable local steam power. There are dam sites for smaller dams on the Colorado, involving less risk and giving a lower cost per horsepower developed. As water-power investments they would be superior to the Boulder Dam project, but even they are not now attractive because of the present-day trend of steam costs and the long distance to markets.

(d) The justification for building the All-American Canal is not readily apparent. The shifting sand dunes, through which it must inevitably pass, may well prove a more serious problem than that of maintaining a canal in Mexican territory, particularly when account is taken of the fact that neither the Boulder Dam nor the All-American Canal will relieve the Imperial Valley from the necessity of dealings with Mexico because of the need for maintaining levees there to keep the Colorado out of the Salton Sea and because of the need for agreements as to the division of water. Since the All-American Canal is entirely apart from the flood control problem, the two should not be tied together, but each should be treated separately on its own merits. This would avoid a needless confusion of issues.

Discussing a little further the second objection raised, because of the unprecedented height of the dam proposed, the Reclamation Service sought out a very narrow canyon for its location so as to save the enormous yardage of concrete which a longer dam of such height would entail. At the chosen site, the width of the canyon at water surface is about 350 ft. At the crest of the dam, some 550 ft. higher, the width is about 900 ft. The dam site saves concrete, but the depth to bedrock is very great—three times as great as at other dam sites where the walls of the canyon are farther apart. Foundation troubles multiply rapidly with increasing depth.

The flood flow past the dam rises at times to 200,000 cu.ft. per second. Flash floods during almost any season of the year may rise to 100,000 cu.ft. per second. As it would be manifestly impossible to cofferdam half the river and dig down 127 ft. to bedrock, the plan proposed calls for diversion tunnels, supplemented by cofferdams across the entire river. It is proposed to build temporary rockfill cofferdams, behind which are to be built permanent cofferdams of concrete. The temporary cofferdams are to contain about 1,000,000 cu.yd. of material. The upper permanent cofferdam is to be a very thin arch dam about 225 ft. high—in a class with the very high dams of the world. It is proposed to build these two sets of dams and do this excavating during one low water season, an apparent impossibility in view of the quantities of material to be handled, the uncertainties to be faced and the limited space to work in. In the first place, there is good reason to doubt that the river can be dammed by dumping rock into the stream except at a very low flow stage—perhaps late in the season. Rock dumped into this very narrow gorge would quickly build up an appreciable head, giving the river transporting power to carry away rock as fast as new material is added. An attempt to carry out this ambitious program would probably result in a flood catching and overtopping the partially completed cofferdams. Such drowning out would in any case be costly and might be disastrous to the river valley below if the failure occurred after the temporary cofferdam had been completed but before the permanent ones were in. Such failure would mean starting all over again, with as much chance or more so of getting caught just as badly by the next flood.

A wiser plan would surely be to spend very much more money than has been proposed, in digging several additional diversion tunnels, which, with the use of only a low rock-fill cofferdam, could divert any flood reasonably to be expected. The drowning out of a low dam would be costly, but not disastrous.

### THE ESTIMATES IN ERROR

Because of the uncertainties to be met in handling the difficult foundation problems of Boulder Dam, any cost estimates are bound to be unreliable, but the estimates of the Reclamation Service seem to be low in this and in other particulars. The item of mass concrete has been estimated to cost $7 per cubic yard, whereas under the circumstances a unit price 40 per cent greater would appear more reasonable, though such an increase in this item alone would add many millions to the estimated cost of the dam.

The foregoing considerations have caused experienced engineers, in studying this proposed undertaking, to estimate that the dam will require ten years to build and will cost 2½ times the government's estimate. These considerations also explain why the engineers of the Reclamation Service are almost alone in selecting the Boulder Dam site.

The rate of return on a hydro-electric power investment depends principally on the capital cost, the interest rate, the sale price of power, the number of years required to market the power output and on the capacity factor, which is the ratio between the average load carried by the power plant to the total load that the plant is capable of carrying.

The self-same development project, as an investment, can be made to look very attractive or most unattractive by pyramiding all the favorable factors or by pyramiding the unfavorable. In the general case the favorable and unfavorable factors are mixed up and the result comes out somewhere between the rosy prospectus and the dire prediction. It is believed that the Reclamation Service engineers have been optimistic in their estimates. In making the assumptions and estimates set forth herein an effort has been made to arrive at probable values as shown by experience.

### REVENUE FROM SALE OF ELECTRICITY IS QUESTIONABLE

The Swing-Johnson bill before the last Congress provided for the repayment to the United States in 50 years of the funds advanced to cover the cost of the complete project. The revenues for such repayment were to come from the sale of electricity generated at Boulder Dam, from the sale of stored water for irrigation and for domestic use and for the disposal, under the reclamation act, of such public lands as are made reclaimable by the irrigation works proposed. How much revenue might be expected from the last source is a question. At any rate, the proponents of the bill have claimed that the revenue from Boulder Dam itself will more than suffice to reimburse the federal treasury for the loan of its credit to cover the cost of the complete project, the All-American Canal included.

The Secretary of the Interior, in a letter to Congress dated Jan. 12, 1926, estimates a total capital cost of $125,000,000, a construction period of five years, annual revenue of $12,300,000, annual charges of $6,200,000 and the repayment of all costs in 25 years. The sale price of power at the dam is estimated at 3 mills per kilowatt-hour. The $12,300,000 revenue includes an estimated return of $1,500,000 from the sale of stored water, the remaining $10,800,000 being the estimated return from the sale of power. A capacity factor of 55 per cent is used. On this basis Boulder Dam is an attractive investment, but that, of course, depends on the reasonableness of the estimates.

The estimated cost of the dam and flowage rights is $41,500,000. With allocated interest this amounts to $55,000,000. The estimated cost of the equipment for the power plant, with allocated interest, is $35,000,000. The sum of these two estimates is $90,000,000. As stated before, in the opinion of experienced engineers who have given the matter study, the estimates for the dam should be multiplied by 2½ to get a more reasonable estimate of $137,500,000. The estimate for the power equipment should be increased to $42,500,000 to bring it into line with present costs, making the total probable cost of the dam and power house $180,000,000, or just double the government's estimate. To this cost must be added the accumulated deficit during the years required for the power market within reach of Boulder Dam to absorb its complete output.

The estimated cost of the All-American Canal, with allocated interest, is $35,000,000. No attempt has been made to check the accuracy of this estimate nor of the estimated return from the sale of stored water. Using the $35,000,000 estimate, the probable cost of the complete project is $215,000,000, instead of $125,000,000 as estimated by the Department of the Interior.

A reasonable estimate of the time required completely to absorb the output of Boulder Dam is eight or nine years. The present installed capacity in all southern California, including the territory centering around Fresno, is 1,350,000 hp. A comparison of the predictions of various authorities in California indicates that ten years hence this capacity will be 2,700,000 hp. and that the rate of growth at that time will be about 120,000 hp. per annum. Hydro plants are now supplying 70 per cent of the power being generated. These cannot be shut down; the capital expenditures have already been made and operating costs are small. The present steam power installation in southern California, compared to the estimated load of ten years hence, is small, 627,000 hp. Part of this is already being used as standby reserve. Ten years hence most of it will be, and the need for standby power will not be eliminated by the introduction of power from a source 250 miles away. During the period of construction of Boulder Dam the normal growth of load will have to be supplied as fast as it develops. This growth is now largely being provided for by the construction of new steam plants located near the market, and this is the power that Boulder Dam will have to compete against. A 250-mile transmission line does not afford equally reliable service.

The capacity factor is an important element of the cost of power production. A high factor means high utilization of equipment and a comparatively low cost of production. This factor is fixed by the requirements of the market to be served and is largely independent of the source of power. The present over-all capacity factor for southern California is 39.5 per cent. This compares favorably with that of other parts of the country, and it may be expected to remain in the vicinity of 40 per cent. Because of expensive transmission costs it would be good economy to operate Boulder Dam power plant on a high capacity factor, thus throwing the burden of very low capacity factors on the plants near to market. A capacity factor of 55 per cent for Boulder Dam seems reasonable. For comparing production costs, a large steam plant located at Long Beach, Cal., will be assumed to operate at this same high factor.

### COMPETITION FROM STEAM

Such a plant installed today can deliver power at Los Angeles for about 5.7 mills per kilowatt-hour. This price, reduced by the energy losses and cost of 250 miles of transmission from Boulder Dam to Los Angeles, becomes 3 mills per kilowatt-hour, which is the price at Boulder Dam for power sold in competition with the large steam plant of today. But steam efficiencies are improving, and it is reasonable and safe to predict that ten years hence, or when Boulder Dam project could be expected to be completed, steam costs will be so lowered by increased fuel economies that the price quoted above for power at Boulder Dam will be 2 mills per kilowatt-hour.

The argument may be raised that fuel prices will probably rise to offset the advantage of increased efficiencies. A material rise in the price of oil would promptly be offset by switching to coal. On the other hand, a combined mercury vapor and steam generating unit now being successfully experimented with at Hartford seriously threatens to cut generating costs so that power at Boulder Dam would have to sell for 1 mill per kilowatt-hour to compete with such a plant in Los Angeles. This last figure is given merely to point out that the possibilities for the next ten or more years favor steam development rather than hydro. Later on, the cost of money and other factors may tend to even up the differences.

It might also be argued that offsetting the prospective shrinkage in steam power cost is a probable reduction in interest rates on capital. On this point it should be noted that steam power costs will have ten years within which to shrink after the capital for the construction of the project has been provided. We are dealing with money rates now—steam costs ten years hence. The Swing-Johnson bill before the last Congress carried an interest rate of 4 per cent.

### RETURNS ON THE INVESTMENT

For studying the Boulder Canyon project as a power investment, a price at Boulder Dam of 2 mills per kilowatt-hour will be used. That this is a reasonable estimate may be seen from the fact that in 1924 the engineers of the Reclamation Service estimated the sale price at Boulder Dam of 3 mills per kilowatt-hour, or 1 mill higher than the price it is now proposed to use, whereas in the three years after their report was made, from 1924 to 1927, the fuel cost in southern California, at 55 per cent capacity factor, of large steam plants has shrunk 0.85 mill per kilowatt-hour. It is not a far stretch to assume a further material shrinkage in the next ten years.

The estimate of the Secretary of the Interior that the entire cost of the project could be paid for in 25 years omitted from consideration the item of depreciation. Presumably this was because the project would be paid for before the need for replacements became an important factor. The estimated price for current is so high and the estimated cost of the dam is so low that it is not reasonable to assume such a brief amortization period. The Swing-Johnson bill calls for amortizing the investment in 50 years. For such a period depreciation will have to be provided. A conservative estimate of 0.5 per cent on the dam, 2.5 per cent on the equipment and 2 per cent on the canal will be used.

On the basis of the assumptions heretofore made a project cost of $125,000,000 can be amortized in 50 years, as required by the Swing-Johnson bill, if the power were sold at the dam for 2.6 mills per kilowatt-hour. This is 30 per cent higher than the price heretofore determined as the probable amount for which power can be sold. At the probable competitive price of 2 mills per kilowatt-hour, the project could not be amortized. Annual charges would exceed income.

If the burden of the All-American Canal were removed from the project, at the same time eliminating the anticipated income from the sale of stored water, the remaining $90,000,000 cost could be amortized in 50 years, provided the price of power at the dam were 2 mills per kilowatt-hour. This equals the probable competitive price. In other words, if the cost estimates were correct, the power dam, by a thin margin, could carry flood control storage alone, but not the All-American Canal in addition.

The foregoing figures are based on cost estimates which are considered far too low. If the more probable cost of $215,000,000 for the complete project is used, the investment with or without the All-American Canal never can be amortized at the 2-mill competitive price for power. The deficit during the loading period would increase the amount to be amortized on the complete project to $295,000,000 and the annual deficit at the end of that period would be $6,700,000.

To amortize in 50 years, as required by the Swing-Johnson bill, the probable cost of the complete project ($215,000,000) would require a sale price for power at Boulder Dam of 4.25 mills per kilowatt-hour. To amortize in 50 years the probable cost of the dam and power house alone ($180,000,000) would require a sale price at Boulder Dam of 3.7 mills per kilowatt-hour, a price 85 per cent greater than the probable competitive price ten years hence.

From the preceding analysis it would appear that under most favorable conditions affecting construction costs, the government could make a power investment at Boulder Canyon without losing or making money, provided, however, the cost of the All-American Canal is not saddled on. But lacking the most favorable conditions, the government stands to lose heavily on its investment. This explains why, in the days when steam prices were higher, applicants to the Federal Power Commission who were prepared to proceed with bona fide development on the Colorado proposed smaller dams and uniformly avoided Boulder Canyon as a dam site. The borings and surveys of the Reclamation Service showed them that better power investments could be had elsewhere on the river.

## Electrification in Russia

EXTENSIVE electrification of Russia as a definite government policy is a very recent development. The first comprehensive plan for the electrification of the country was drawn up by the electrification committee appointed by the Soviet Government in 1920. The plan, according to a recent issue of the *Economic Review* of the Soviet Union, calls for the construction, during a period of from ten to fifteen years, of 30 new regional stations, with a total capacity of 1,500,000 kw. Special provisions were made for the utilization of low-grade fuels instead of coal or fuel oil. As a result, a number of plants using peat, lignite and fine coal not suitable for other uses have been built during the past few years.

Since 1922 there have been constructed and placed in operation eight new regional stations with an aggregate capacity of 197,000 kw. and a number of smaller stations. Two of the former are hydro-electric plants, three consume peat and three use low-grade coal. The largest are: The Volkhov, 56,000 kw., hydro-electric, 75 miles from Leningrad, which was placed in operation at the beginning of 1927 and will supply that city with 250,000,000 kw.-hr. annually; the Shatura, 48,000 kw., 80 miles from Moscow, close to large peat deposits, which constitute the source of fuel, and the Kashira, coal burning, serving 32 villages in the Moscow district with a present capacity of 12,000 kw., which is to be increased to 40,000 kw. by the end of 1928.

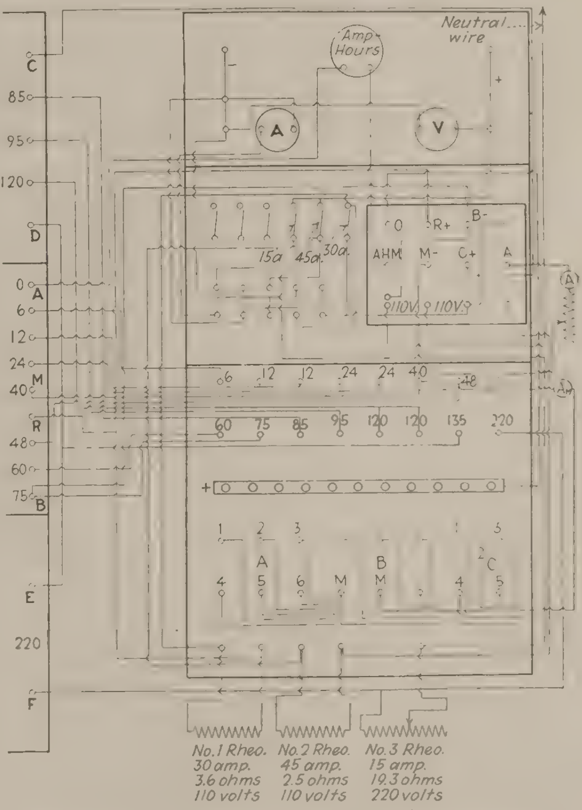
The present total of the three peat-burning plants is 88,000 kw. This is to be considerably increased in the near future. Of the new power stations under construction by far the most important is the Dnieperstroy hydro-electric project. This is to have a capacity of 650,000 hp. Work on it was started this year. Besides furnishing energy its completion will have an important bearing on commerce, for it will render the Dnieper navigable over its entire length. Five other good-sized stations, aggregating 201,000 kw., are reported under construction, according to this report.

## Simplified Control of Battery Group

By H. S. Bueche
*Instructor in Electrical Engineering*
*Kansas State Agricultural College, Manhattan, Kan.*

THE problem of making available for electrical test purposes several different values of direct-current potential from a battery source has been solved rather satisfactorily, in the opinion of members of the electrical engineering department of the Kansas State Agricultural College.

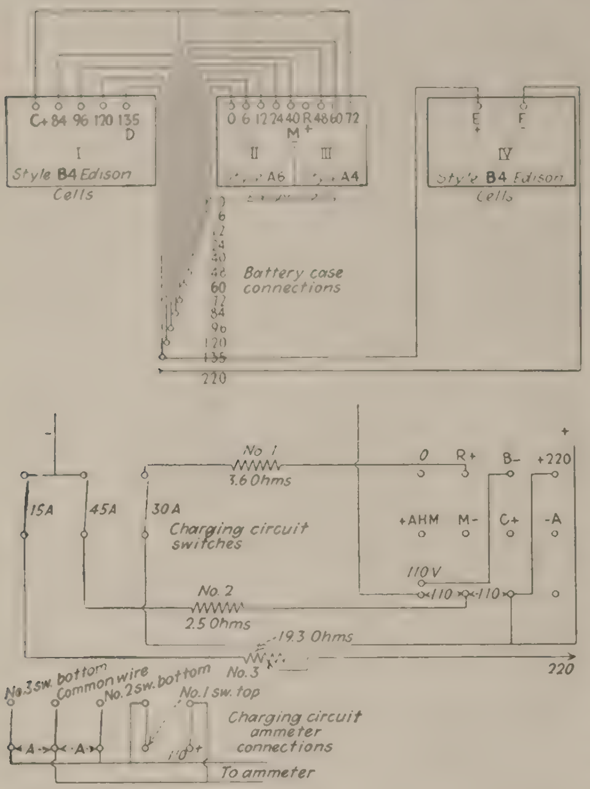
Inasmuch as the laboratory concerned was supplied with three different sizes of Edison cells, the necessity for frequent handling, connection and reconnection of groups of cells to obtain the desired values of potential and likewise to secure proper charging rates for the battery groups was a source of difficulty.



ARRANGEMENT OF WIRING CIRCUITS TO SWITCHBOARD BOTH FROM BATTERY AND FROM CHARGING SOURCE

The accompanying diagrams indicate in some detail the scheme of wiring followed. The switchboard as at present arranged provides for fourteen voltages varying in value from 6 volts up to the maximum of the battery unit (at present 220 volts), which can all be drawn upon simultaneously or not as the occasion warrants. The arrangement is extremely flexible, it being readily possible to add more taps to the board for as many intermediate values of voltage as desired.

A four-pole, double-throw switch with an extra terminal added to one of the circuits is the real feature of the arrangement. By closing this switch in one position the voltage taps on the switchboard front are energized. By closing the switch in the reverse position the three different sizes of Edison cells are reconnected in the proper charging sequence and automatically thrown on charge at the correct rates—namely, 15 amp. for the B-4 cells, 30 amp. for the A-4 cells and 45 amp. for the A-6 units. The rheostats controlling the 30-amp. and the 45-amp. charging circuits have a fixed value of resistance; the third rheostat is a variable one to allow for minor corrections necessitated by variation in the 220-volt source of supply.



*Battery connections and charging circuits in detail*

Batteries I and IV in series charge on 220 volts, 15 amp.; II charges on 110 volts at 45 amp.; III charges on 110 volts at 30 amp. Four-pole double-throw switch closed down connects charging circuits through auxiliary switches; closed up connects taps on board. The 15-amp. charging switch closed with four-pole double-throw switch in up position connects special balanced voltage source to motor-generator set.

A single ammeter which can be cut in independently on each of the three charging circuits in turn provides a ready check on the current values. The ampere-hour meter on the board is used only to give an approximate idea of the drain on the battery unit as a whole. Connected in the line common to all cell groups, whether charging or discharging, the value of this meter lies chiefly in providing a record of extreme conditions of battery charge or discharge.

Individual single-pole knife switches permit the charging of any one of the three groups of batteries independently of the others. Although the supply mains into the charging panel have a rated capacity of only 50 amp., the use of a three-wire system with a balancer set gives 110 volts between so-called neutral and outside wires and 220 volts across the latter. Balancing the 15-amp. and 30-amp. units against the 45-amp. cells keeps the current flow in the outside wires just below the maximum value, while the net flow in the middle wire remains zero.

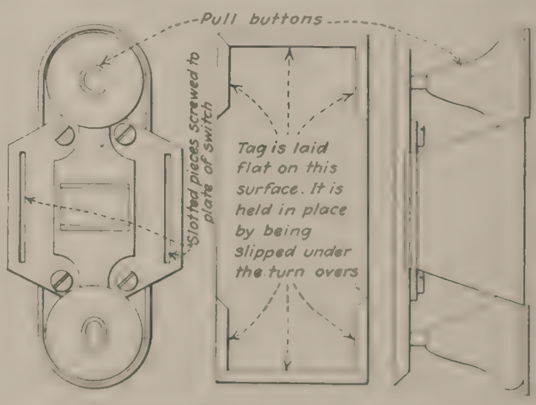
By a connection between the 40-volt terminal on the switchboard and the lug marked *A* on the four-pole, double-throw switch a condition of charging one group of cells can be obtained such that they will "float" on the supply line, maintaining at *M* and *M* of the bottom panel section *B* an unvarying potential of 220 volts irrespective of a changing load thrown upon the line. This scheme has been found most useful when calibration of watt-hour meters was in process.

## Switch Tag Holder

ON MANY electric systems it is common practice to tie "hold" tags (indicating that men are at work on apparatus or lines) to the handle of the controlling switch. In the case of remotely operated switches this practice has been improved upon in the plants and stations of the Northern States Power Company.

Under the heads of the screws which hold the switch-plate to the panel are set pieces of flat metal in which slots about ⅛ in. wide and 2 in. long are cut parallel to the side of the plate. Another piece of flat metal sufficiently long and wide to cover the pull knobs of the switch has tongues bent down at right angles at each side so that by bending these tongues slightly inward they may be inserted in the slots attached to the switch-plate. The outward pressure of these tongues holds the upper piece firmly in position. The ends and portion of the two sides of the flat top of this piece are bent over on themselves so that the "hold off" card may be slipped under them.

This tagging arrangement not only provides a secure method of holding these cards but it also prevents any inadvertent movement of the switch knobs from the front of the board or from the back if they are being worked on. When the switchboard operator receives orders to remove the tags and close the switch which has been held open it is necessary for him to take off this tag holder before the switch can be operated. This is in itself a good thing, since the removal of the holder increases the element of deliberation with which the operation of all switches should be accomplished.



Pull buttons
Slotted pieces screwed to plate of switch
Tag is laid flat on this surface. It is held in place by being slipped under the turn overs

TAG HOLDER FOR CONTROL SWITCHES

## in Space Provided for Twenties

Two 100-ton cranes and a lifting beam required to handle installation of monster generator. Station controls grouped to facilitate response to peak-load emergencies

By Raymond P. Moore
*Mechanical Engineer Buffalo General Electric Company, Buffalo, N. Y.*

> *Public service, particularly in the Niagara district, carries with it an unusually heavy burden of responsibility that continued low cost of electric power generation may perpetuate its clientele in their favored economic position.*
>
> *To accomplish this the utility must function not merely as well but materially better than in less favored communities, while "readiness to serve" under such conditions necessitates not only more efficient base-load power but more economical and more quickly responding peak-load reserve. In this and succeeding articles on the Huntley station some of the efforts which are being made to meet demands for peak-load service, while at the same time concentrating on getting more return from existing investments, are depicted by members of the engineering department of the organization.*
>
> William R. Huntley,
> *President.*

As THE peak-load station of the system, the Huntley station of the Buffalo General Electric Company, formerly known as the River station, contained originally 95,000 kw. of rated turbine capacity, divided between three 20s and one 35, and twelve stoker-fired boilers of 12,500 sq.ft. of water-heating surface and 3,820 sq.ft. of superheating surface each.*

When the extension of the generating capacity of the station was decided upon it was felt that, considering the size of the system and the unit costs of machinery and buildings, it would be desirable to obtain 60,000 kw. in one unit if a way could be found to accommodate it.

The original turbine room of the station had been designed for 20,000-kw. units, set crosswise of the room. When the 35,000-kw. machine was installed it was placed with its shaft parallel to the others by use of the simple expedient of leaving a doorway in the wall opposite the generator end of the unit to permit the withdrawal of the rotor.

It was determined that setting the 60,000-kw. machine lengthwise of the room would require a greater extension to the

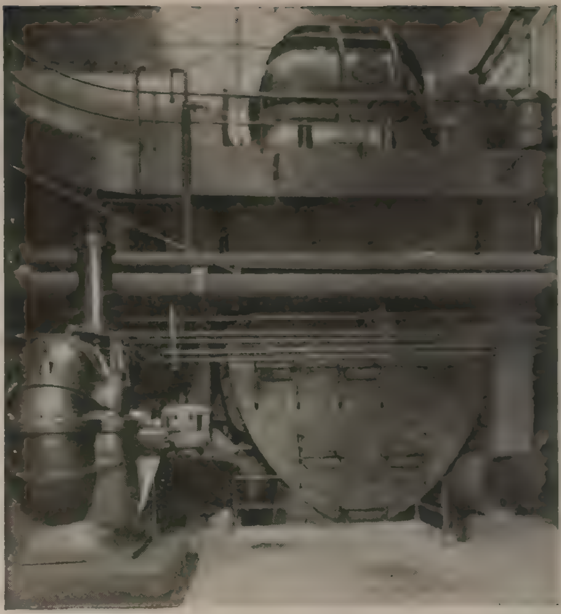
HANDLING 185-TON GENERATOR STATOR DURING INSTALLATION OF 60,000-KW. UNIT AT HUNTLEY STATION



THE 30-IN. CAMERON CIRCULATOR ON THE LEFT SUPPLIES THE 34,000-SQ.FT., SINGLE-PASS INGERSOLL-RAND CONDENSER

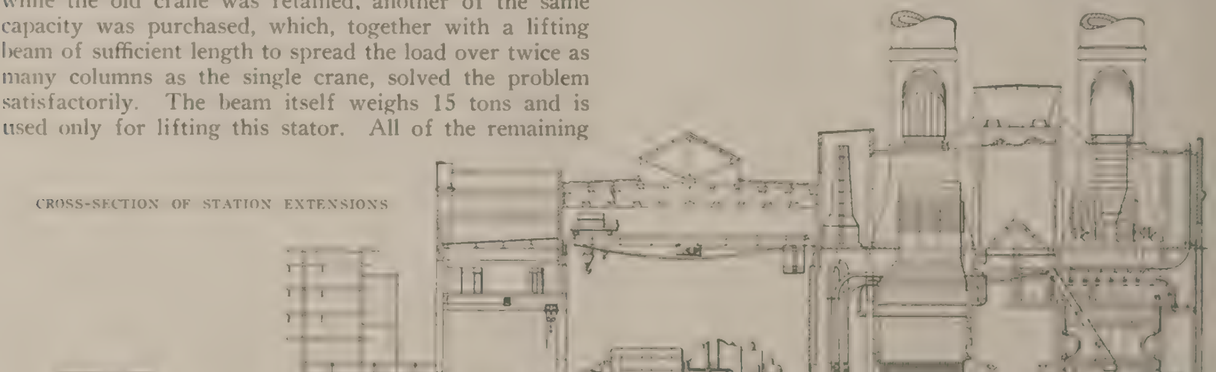
turbine bay, but, on the other hand, the entire unit could be comfortably placed crosswise of the room within the 75-ft. span of the crane if means for removal of the generator rotor could be managed. Since changes in the design of the extension as compared with the old plant included the elimination from the electrical bay of all high-tension switches, that wall of the turbine bay could be omitted, and a 40-ton chain hoist hung from a trolley beam in the electrical bay was arranged to handle one end of the generator rotor during its placement. This arrangement permitted the 60,000-kw. machine to be placed in a turbine room designed for twenties and without necessitating any change in the length of the crane span.

The old turbine-room crane of 100-ton capacity was, of course, by itself too light to handle the generator stator of the new unit, which weighed 185 tons. Another item was the building columns, which had not been designed to carry such a load if concentrated. Accordingly, while the old crane was retained, another of the same capacity was purchased, which, together with a lifting beam of sufficient length to spread the load over twice as many columns as the single crane, solved the problem satisfactorily. The beam itself weighs 15 tons and is used only for lifting this stator. All of the remaining lifts are within the safe carrying capacity of one crane.

The new generating unit is of General Electric manufacture, rated at 60,000 kw., 66,667 kva., 12,000 volts, 25 cycles, 1,500 r.p.m. The turbine is a single-cylinder, two-bearing machine, with seventeen stages, arranged for bleeding at the tenth, thirteenth and fifteenth.

The largest single piece was the turbine end of the bottom exhaust casting. This weighed 60 tons. The last three wheels were too large for shipment assembled on the shaft and these had to be shrunk on in the field. The generator stator frame came in two pieces and the laminations were assembled with the frame on end.

All auxiliaries, with the exception of the air-removal apparatus and the auxiliary oil pump, are motor-driven, designed for full voltage starting with push-button control. Two 30-in. Cameron type FV circulators, duplicates of each other, are capable of pumping together 60,000 gal. per minute. The motors are two-speed, of 250-hp. capacity at 360 r.p.m. and 125 hp. at 240 r.p.m.



CROSS-SECTION OF STATION EXTENSIONS

The condensate pumps are two in number and of equal size, each capable of handling the total condensate at full load on the machine. They are of the Cameron H.W. type, designed for positive pressure on both seals, and are driven by 100-hp. squirrel-cage induction motors. The bleeder heater drip pump is of the same type, but of smaller dimensions.

The tenth stage of the turbine is tapped for steam to a set of evaporators previously existing in the old station. These evaporators were of the high-heat type, taking steam from the high-pressure headers. It is now possible to operate them from either source, as conditions demand, and arrangement is made so that they may exhaust into one of the bleeder heaters.

In view of the requirement for quick starting, particular attention was paid to concentrating instruments and controls. The gages showing the pressures at various vital points in the turbine are grouped together on one end of the oil tank adjacent to the throttle valve. Set into the wall just back of the turbine is the instrument panel, supporting indicating and recording pressure gages and thermometers. Near to the throttle valve are grouped a series of valves for priming the circulators, supplying sealing water and sealing steam and priming indicators. After producing the initial vacuum, the operator can control the auxiliaries and start the turbine without moving more than a few feet from the instrument panel.

TURBINE AUXILIARY CONTROL AND GAGE BOARD FOR THE 60,000-KW. UNIT

The instrument panel is a single sheet of ¼-in. steel, 9⅓ ft. long and 6¼ ft. high. The indicating steam and water pressure gages and thermometers are of Foxboro flush-front construction. The gages have silver faces with black figures and triangular pointers. Three Bailey flow meters occupy the center of the panel. One of them records and integrates the total quantity of drip from the bleeder heaters. The two others show the steam flow in the two 16-in. steam leads to the turbine.

Mounted on the wall to the left of the panel is a Precision mercury column vacuum gage, while on the right-hand side is the Venturi meter, connected to show the condensate from the main condenser. Below the meters are grouped the push-button stations, with their indicating lights, and at each side are the Dean control stations for operating the header valves. The rear of the panel is open on the boiler room side of the wall, where the backs of all meters and wiring are accessible.

Excitation is by a separate unit consisting of a 300-kw. direct-current generator, with a motor and a Terry turbine forming a duplex drive. Normally the motor drives the unit, but the governor of the turbine is so adjusted that after a slight drop in speed due to failure of the motor voltage the turbine will automatically assume the load without interruption of the excitation supply.

# Regulation and the UnstableDollar*

### Plan suggested for preventing losses to security holders resulting from changing price levels

By John Bauer, Ph.D.
*Director American Public Utilities Bureau*

PUBLIC utility regulation has probably suffered more from the unstable dollar than has any other governmental function. This applies particularly to valuation for railroad and public utility rate-making. The great change in the value of the dollar since the beginning of the war has raised grave issues as to the fundamental rights of the companies, and has seriously threatened the future continuance of rate regulation. It now requires special reconsideration of the purposes, scope and methods of regulation to meet the conditions of the unstable dollar—conditions which had not been regarded more than casually when the existing basis of rate-making was first instituted.

The standard of "fair value," so far as the law was concerned, and reproduction cost, less depreciation as to technique of initial valuation, together constituted the procedure which, under the circumstances as existing and understood prior to the war, promised to provide a definite, administrable and financially sound basis of rate-making. Unfortunately, however, it was never directly established by legislative action and had not existed sufficiently long to become generally fixed in the fundamental law. Consequently, when prices shot upward because of the unstable dollar, it was brought immediately into sharp question and litigation. The court decisions, unfortunately, have resulted in upsetting the whole policy and leaving the basis of regulation in uncertainty, confusion and danger of complete disruption. We are thus confronted with the serious problem of adjusting the foundations of rate-making to the new conditions that have developed because of the unstable dollar. What, therefore, shall be done in the face of fluctuating prices, and particularly in view of the fact that there has been a tremendous rise in price level before the system above described had been firmly established in the law?

The cumulative financial instability following reproduction cost and the unstable dollar cannot be casually brushed aside. It cannot be met by the off-hand declaration that the stockholders have taken the risk and must bear it; while they would make inordinate returns during one period, they would be required to take the losses during another. Such a view might be accepted if the public interest at large were not involved; if we were dealing really with private business and its own risks, profits and losses. The fact is, however, that we are concerned with utilities vested with grave obligations; they are essential public functions, so that the broad public consequences must be considered in establishing a sys-

---

*From a paper presented recently to the convention of the Stable Money Association.*

tem of regulation. The prevailing financial structure of the companies is likely to be a reality for an indefinite period in the future, just like the unstable dollar. While the value of the dollar fluctuates, the return realizable by most of the investors is limited by contract to the dollar, whatever its change in value. With this situation clearly before us, how shall we place regulation upon an effective basis, workable as to administration and sound as to financial policies and consequences?

### Would Adopt Fixed Rate Base

The proposal that I have made and elaborated in a number of articles and in my book on "Effective Regulation of Public Utilities" is to meet the situation with a direct legislative program. My suggestion is to make a valuation of all existing properties and to adopt the results in each case as a fixed sum for the rate base, modified subsequently only as additional investments and retirements are made and as further depreciation takes place. The investment basis should be generally incorporated for rate-making purposes so far as positive future policy is concerned. In respect to new investments made hereafter, there could be no judicial interference because the investors would have direct notice as to the exact limitations upon expected returns. So far as existing properties are concerned, however, reasonable adjustments would have to be made to meet the present situation, in many instances of a much higher level than existed when the investments were made. There is no doubt that, so far as the common stock holders are concerned, if they were not to be held to a return on their actual money investment, they would be subjected to a loss in purchasing power which they had not directly undertaken in their implied contract with the public. The reasonable course, it seems to me, would be to allow to the stockholders in the proposed initial valuations an adjustment equivalent to the rise in prices that has occurred since the actual investments were made through the issuance of common stock. I see no reason, however, why, upon any grounds of justice or desirable policy, a corresponding adjustment should be made to the bond and preferred stock holders' investments, which, in any case, are limited to the actual returns fixed in the contracts. My proposal, therefore, would furnish a reasonable and definite compromise between the extremes of reproduction cost and actual investment which have been urged upon the commissions and the courts.

This plan would provide in each case for a definite and non-varying rate base for the future. It would start with the initial valuation, which would provide a full adjustment for stockholders' investment on the basis of present day prices, and would thereafter keep this sum unchanged except as additions and retirements are made and further depreciation accrues. This would all be under the supervision of the commissions.

The plan would disregard for the future the general changes in prices due to the unstable dollar. It would base regulation upon the actual dollar and would make no adjustments in the rate base upward or downward except as the price changes are reflected in the installation of plant and equipment from time to time. When any capital expenditure, however, has once been incurred, the amount would be a fixed sum and would not be changed thereafter on account of further changes in prices or variation in reproduction cost.

The reason for not permitting any adjustments in the rate base for future changes in the value of the dollar appears wholly in administrative considerations, and particularly the requirements of financial stability. The proposed system could be effectively administered and would provide the returns actually promised, and would attract all new capital as needed for the development of the properties. As new investments are made, the rate of return would have to be paid according to market requirements at the time. This rate would be included as a definite cost, so that, when an investment has once been made under particular conditions, the return required would be practically guaranteed in future rate-making. This virtual guarantee would attract all the new capital needed to meet the requirements of utility expansions. It is a safeguard both to investors and to the public, for which constantly expanding facilities must be provided.

### Fixed Return on Common Stock

The plan would limit the common stock holders to a fixed monetary return in the future, exactly as the bondholders and preferred stock holders are now limited by contract. It would provide, however, for past investments made by common stock holders a full adjustment for the present value of the dollar. For the future it would not provide any further modifications; it would maintain in each case a fixed and non-fluctuating rate base.

There may be a question whether or not it is desirable to hold the common stock holders in the future to the same policy of a rigid monetary return as applies now by contract to bond and preferred stock holders. Personally, I believe that, because of its definiteness, this would be the preferable and more workable procedure. It would be possible, however, to incorporate in the plan an adjustment for stockholders' investment, even for future changing prices. It would be possible by the use of index numbers to adjust the rate base upward or downward with the change in prices so far as the common stock investments are concerned, but not to extend the adjustment to bond and preferred stock holders' investments. If such a limited variability was included in the rate base, it could be administered without great difficulties and would still assure the full financial stability of the companies. The increase in money return thus allowed to the stockholders during rising prices would be merely in the same proportion as the increase in prices, and, conversely, the decline in the monetary return would be in direct proportion to the fall in prices. There would be no cumulative effect upon the common stock; neither a three- or four-fold increase during one period nor a three- or four-fold decline during the other.

---

## Employee Use of Appliances

THE Southern California Edison Company has recently undertaken a survey to ascertain the number of electrical appliances owned and used by its own employees. Twenty-seven per cent of the home owners are using electric ranges, while 19 per cent utilize electric water heaters. The largest ratio of appliances to employees is found under the head of laundry irons, 3,049 being used by the 3,010 employees maintaining homes. The next most popular piece of electric equipment is the toaster, with 1,839 in use. Vacuum cleaners follow very closely, with 1,672. Washing machines offer a total of 1,196. The report indicates that the electric refrigerator is still considered to be more or less of a luxury product by those members of the industry who supposedly know better, as the total number shown is 107.

# Pennsylvania Utilities*

Inquiry into the electric development of the state with respect to service, rates and expenditures since commission regulation became effective reveals striking economies

By W. D. B. Ainey

*Chairman Public Service Commission of Pennsylvania*

THE following are the outstanding features in the electric light and power situation in Pennsylvania during the years 1914-1927 inclusive, in which the electric utilities have been regulated by the state:

Electric consumers in Pennsylvania are today saving on the average approximately $25,000,000 a year over the rates that were in effect in 1914. In other words, if the rates that were in effect in 1914 were applicable today consumers would be paying approximately $25,000,000 annually more than they are presently paying. The exact figures, according to the calculations of the bureaus of the commission, are $24,283,000.

Service to consumers in Pennsylvania has been multiplied nearly six times since 1914. There are today 1,707,000 residential, commercial and power consumers, as against 321,400 in 1914, and the consumption has increased from 1,006,750,000 kw.-hr. to 7,127,900,000 kw.-hr. This period of reduction of rates and extension of service has been coincident with the investment of $640,000,000 in power plants and distribution systems.

Development and co-ordination of the electric industry in Pennsylvania has been a chief factor in the industrial and economic development of the resources of the Commonwealth during the past one and one-half decades.

From the standpoint of conservation, it may be noted that increased plant efficiencies of the electric development within the state of Pennsylvania in 1927 over 1914 represents a yearly saving (or decrease) of 8,200,000 tons of coal.

Under the regulatory supervision of the state this industrial and economic development has, as a natural sequence, been extended to the agricultural industry of Pennsylvania. During the year 1927 rural extension electric lines involving an expenditure of $3,000,000 for the construction of 1,441 miles of rural electrification and the connection of 17,700 consumers were accomplished under the general orders and rules of the Public Service Commission. During the next four years it is estimated that an additional $8,000,000 to $10,000,000 will be spent in the construction of 4,000 to 5,000 miles of rural extension lines for the development of the agricultural industry in Pennsylvania.

### Comparative Statistics

The following remarks give in some detail a statement of the development of electric service in Pennsylvania from 1914 to 1927, inclusive, and have been prepared from data representative of approximately 98 per cent of the total electric energy supplied in the state:

In the thirteen years ended Dec. 31, 1927, electric companies in Pennsylvania increased the number of residential and commercial customers served by them from 305,748 to 1,651,817, an increase of 1,346,069, or 440 per cent, and increased the number of power customers from 15,620 to 55,708, an increase of 40,088, or 256 per cent.

### Great Increase in Energy Consumption

In the same period the kilowatt-hours sold to residential and commercial customers increased from 193,860,000 to 1,151,289,000, an increase of 957,429,000, or 494 per cent; kilowatt-hours sold to power customers increased from 812,893,000 in 1914 to 5,976,613,000 in 1927, an increase of 5,163,720,000, or 635 per cent. Figures are not available to separate the total number of customers and total kilowatt-hours sold in the respective years as between residential and commercial classes. Separation is possible to an extent representing more than 80 per cent of the total residential and commercial customers in 1927. The number of residential consumers thus separated increased from 158,345 in 1914 to 1,135,682 in 1927, while the kilowatt-hours sold to them increased from 37,249,000 in 1914 to 484,008,000 in 1927, representing an increase in the average consumption per residential customer from 235 to 427 kilowatt-hours per annum, an increase of 81.7 per cent. The total revenue from these residential customers in 1914 was $4,069,793 and in 1927 was $32,501,317, reflecting the increase both in number of customers and use per customer.

The number of commercial customers thus separated increased from 66,356 in 1914 to 197,303 in 1927, while the kilowatt-hours supplied to them increased from 122,677,000 in 1914 to 488,589,000 in 1927. This represents an increase in average consumption per commercial customer from 1,848 kilowatt-hours to 2,527 kilowatt-hours per annum, an increase of 36.7 per cent.

The total revenue from these commercial customers in 1914 was $6,632,608 and in 1927 was $25,352,766, also reflecting increases in the number of customers and use per customer.

Gross revenue from residential and commercial customers as a whole was $13,027,698 in 1914 and $71,622,510 in 1927, an increase of $58,594,812, or 450 per cent. Gross revenue from power customers increased from $14,337,789 in 1914 to $90,237,427 in 1927, an increase of $75,899,638, or 530 per cent.

For residential customers, for which separation data are available, the average annual bill per customer in 1924 was $25.70 and in 1927 $28.62, while consumption per customer increased from 236 kilowatt-hours to 435

---

*Excerpts from statement before the committee on interstate commerce, United States Senate, Jan. 26, 1928.*

kilowatt-hours. This represents an increase in the annual bill of $2.92, for which 192 more kilowatt-hours were given.

For commercial customers, for which separation data are available, the average annual bill per customer in 1914 was $99.96 and in 1927 $128.50. This is an increase in the annual bill of $28.54, for which 679 more kilowatt-hours were supplied in 1927.

In considering these figures, it must be borne in mind that there has been a marked change in the type of average user of electric service since 1914, particularly as relates to the average use per customer. In 1914, in both large and small cities, the users of electric service were, generally speaking, the larger residences, the owners of which could afford the comparatively high cost of wiring them, and the more progressive and larger stores and commercial establishments. At that time the competition of gas service continued to be strong in our older communities in house and store lighting and many smaller industries continued to use direct steam power or their own small electric plants.

### PREPONDERANCE OF SMALLER USERS

In the period to 1927 this condition has largely changed. As the result of wiring campaigns, with the assistance in financing given by the electric companies, practically all the older houses have been wired for service, while every new house has been equipped for that purpose. Even the smallest stores have adopted the modern method of lighting. The widespread introduction of devices for use of electric service in small industries has added these establishments in large numbers. The effect has been that the number of customers in all classes has been greatly increased and that relatively the larger number of new customers have been found among those who are relatively smaller users.

This preponderance of smaller users among the new customers of all classes has affected the average statistics of the electric industry in comparing 1914 and 1927. The average annual use per customer would certainly have increased by a greater percentage if this preponderance of smaller new customers had not occurred and been averaged into the figures So also the average cost per kilowatt-hour would have been reduced by larger margins. The lower average use by the relatively greater number of small users among the new customers results in a comparatively higher average cost per kilowatt-hour than would be the case if there had been an equal number of larger users among the new customers.

When these conditions are kept in mind the increases in average use per customer and the decreases in average cost per kilowatt-hour shown by the record of this period of thirteen years in Pennsylvania are striking and significant.

On the 1927 volume of business the apparent saving resulting from the application of the difference in revenue per kilowatt-hour realized in 1914 and 1927 is $40,786,000.

The foregoing saving figure has been produced in part by the customer himself through a more liberal use and in part by reduction in rates by the utility companies. A study has been made applying, in so far as possible, the 1914 rates to the 1927 volume of business. The results show that $24,283,000 of the above $40,786,000 is assignable to actual reduction in rates. A like study based on rates in effect at approximately the close of the period of peak prices caused by the war shows that the consumers of 1927 would have paid $33,178,700 more for the service they received if the rates in effect in 1921 had applied.

Between Jan. 1, 1914, and Dec. 31, 1927, electric companies in Pennsylvania made gross additions to fixed capital accounts of $690,000,000. In this period retirements amounted to $62,000,000. The net increase in fixed capital accounts totaled $628,000,000.

Increases in major service facilities are shown by the following three items:

### STEAM POWER PLANT DEVELOPMENT

Among the items provided by the above additions to fixed capital accounts were an increase in steam power plant capacity from 469,899 kw.-hr. to 2,286,000 kw.-hr.

In 1914 there were 160 steam power plants in operation in Pennsylvania for electric service, with average capacity of 2,937 kw.-hr.; at the close of 1927 there were 61 power plants, with average capacity of 37,475 kw.-hr.

In 1914 1,179,000,000 kw.-hr. were generated by steam power and in 1927 6,969,000,000 kw.-hr., an increase of 5,789,000,000 kw.-hr., or 491 per cent.

The coal consumed per kilowatt-hour in 1927 was less than two-fifths of the 1914 consumption per kilowatt-hour, equivalent to a saving of more than 8,233,000 tons of coal per annum on the basis of generation in 1927. The weighted average price of coal delivered to electric companies in Pennsylvania practically doubled during the period 1914 to 1927, or an increase of $1.66 a ton.

### HYDRO-ELECTRIC POWER PLANT DEVELOPMENT

The hydro-electric power plant capacity in 1914 was 98,305 kw.-hr. and increased to 268,415 kw.-hr. in 1927.

In 1914 30 such power plants were in operation in Pennsylvania, with average capacity of 3,276 kw.-hr.; at the close of 1927 there were 36 power plants, with average capacity of 7,456 kw.-hr.

In 1914 354,170,100 kw.-hr. were generated by hydro-electric power and in 1927 1,128,228,100 kw.-hr., an increase of 774,058,000 kw.-hr., or 219 per cent.

Combined steam and hydro-electric plants in 1914 had a capacity of 568,204 kw.-hr. and in 1927 2,554,422 kw.-hr. In the respective years combined energy output was 1,533,170,000 kw.-hr. and 8,096,288,000 kw.-hr., or an increase of 428 per cent.

The average annual output per kilowatt of capacity in 1914 was 2,700 kw.-hr., and in 1927 had increased to 3,170 kw.-hr. At the rate in 1914 the capacity of combined steam and hydro-electric power plants in 1927 to produce the kilowatt-hours of output in that year would have been 2,998,600 kw., or 444,178 kw. in excess of the actual 1927 capacity in these plants.

### TRANSMISSION FACILITIES

The increases to fixed capital accounts are also represented by 8,091 miles of transmission lines in 1927, compared with 1,673 miles thereof in 1914, an increase of 6,418 miles, or 384 per cent. The increase in transmission line mileage of 6,418 miles is equivalent to eighteen times the distance from Philadelphia to the western state line.

### SYSTEM INTERCONNECTION

Twenty-eight electric companies in Pennsylvania have established a total of 76 interconnections with facilities of other companies, having a total capacity of 853,300 kw., by means of which 1,363,110,000 kw.-hr. were delivered and received by the parties thereto in the twelve months ended Nov. 30, 1927.

Of the 76 points, fourteen involve interstate transmission, with total capacity of 314,000 kw., by means of which in the like period 831,704,000 kw.-hr. were delivered and received.

Current may be transmitted in either direction at all of the above interchange points.

### INTERSTATE TRANSFER OF POWER

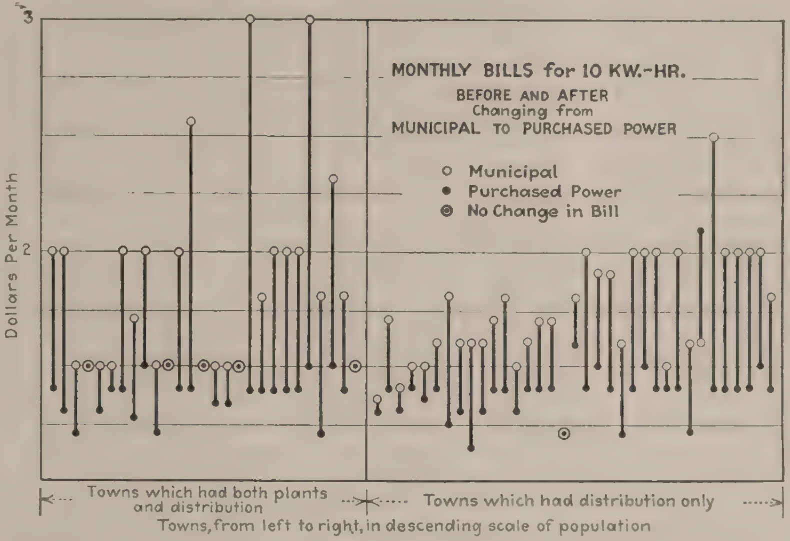
There have been established by electric companies in Pennsylvania 51 points for the interstate transfer of power, including points for transmission one way and for transmission both ways. On the twelve months ended Nov. 30, 1927, 634,084,541 kw.-hr., or 7.83 per cent of the total kilowatt-hours generated in the state, were transmitted out of the state. In the same period 636,607,337 kw.-hr. were transmitted into the state. The net result of all interstate transmission was, therefore, that the energy generated in the state was increased by 2,552,796 kw.-hr., the energy secured from other states being equivalent to only 0.031 per cent of the total energy generated within the state.

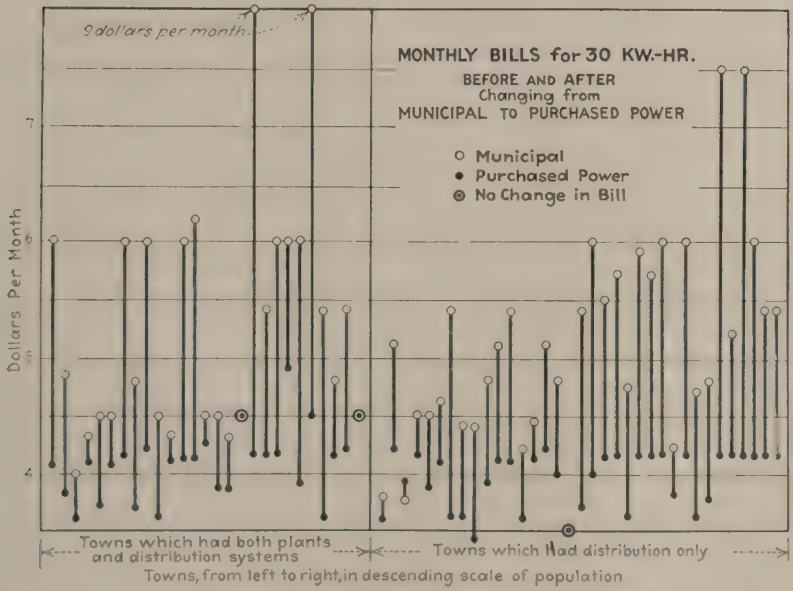
### RURAL ELECTRIFICATION

During the year 1927, in eight months of which General Order 28 was effective, the electric companies in Pennsylvania built 1,441 miles of rural distribution lines at a cost of $2,898,000 and connected 17,663 rural customers, of which 4,317 were farmers. In other words, rural customers are being connected at the rate of 58 customers for each working day of the year. Rural service is being extended rapidly and during the next four years the utilities expect to build 4,000 to 5,000 miles of lines.

## All Customers Benefit by Change from Municipal to Purchased Power

According to a recent analysis of 62 Iowa towns that have changed from municipal to purchased power, Prof. Arthur H. Ford, University of Iowa, concludes that all classes of customers have benefited by the change. The study involved towns ranging from 91 to 1,086 population and a calculation of monthly bills under the rates of the displaced municipal plant and the supplanting utility system. Comparative bills were figured for energy consumptions of 10, 15, 20, 30, 40, 50 and 75 kw.-hr. per month and hence represent effect on small, average and large domestic consumers. In calculating the bills they were figured on municipal rates in effect on date of sale and on utility rates of July 1, 1927. No case was considered in which a change from municipal to utility service was made prior to 1922. In fact, most of the cases involve recent changes, 23 being in 1926, nineteen in 1925 and six in 1924.





SUPPLANTING MUNICIPAL PLANTS BROUGHT SMALL AND AVERAGE DOMESTIC CUSTOMERS 20.8 TO 24.3 PER CENT DECREASE IN BILLS

The towns were divided into two general classes: (1) those that previously had both municipal plants and distribution, numbering 27; and (2) those that previously had only municipal distribution, numbering 35. In the first class the average reduction in bills through purchased service was 24 per cent or greater for all classes of domestic consumers, reaching a maximum average of 27 per cent for the 75 kw.-hr. per month class. In the towns that previously had only municipal distribution, the decrease in bills by purchasing energy was 20.8 per cent or greater for all classes.

In fairness to the municipal systems it may be noted that there were six towns in which a 10-kw.-hr.-per-month customer could obtain electric service just as cheap before the change as afterward; in three of these towns the 30-kw.-hr. customer had the same experience.

# Electric Refrigeration Needs Stabilizing

### Sales disappointing in 1927. Too rapid expansion of market will increase cut-throat competition. A middle ground of sound development suggested

By Observer

ELECTRIC refrigeration in the past year has been something of a disappointment to manufacturers, to central-station companies and other dealers. Sales in many localities have fallen short of quotas and, nationally, the volume of electric refrigeration business has not been so large as was reasonably expected at the beginning of 1927. A good many causes might be assigned for this condition, as, for instance, the flood in the Mississippi Valley, the moderate slowing up of business, or, perhaps, lack of salesman power or quality of salesmen who could be found and trained to the peculiarities of electric refrigeration merchandising.

The real reason, however, has been that electric refrigeration has not hit its stride. In 1926 sales ran ahead of manufacturing capacity, resulting in chaotic conditions as to sales, installation and service methods, with the dire consequences of forced production thrown in for good measure. The year 1927 has been almost the reverse and production has far exceeded selling capacity. The present total market for between 4,000,000 and 5,000,000 domestic units was looked upon as a market of consumers' demand—a seller's market, except for price. The belief prevailed that an electric refrigerator exposed for sale to the eager prospect would result in his rushing to sign on the dotted line. Quite the reverse has been true. The man who is in the market for an electric refrigerator today has become more discriminating. He wants to look around, compare appearance, performance, service record and prices, although the last consideration is not so important to the man who is buying a piece of household equipment which he expects to use for the next ten to twenty years.

### Overproduction Heavy in 1927

With general business conditions for 1928 giving promise for steady improvement over those of 1927 and with the season for electric refrigeration sales approaching, it is well for manufacturers, central-station companies and other dealers to look candidly at what happened in 1927 and try to avoid a repetition of disappointing sales volume. There has been a pretty serious overproduction of electric refrigeration units by a number of manufacturers. This has resulted in a considerable amount of warehousing, which in turn has tied up much working capital for distributors and dealers. To a certain extent this is a healthy condition, as it has the effect of forcing the dealer or distributor to exert himself to the utmost to move his stock to release his capital. However, when it reaches a point where the dealer or distributor feels that he must make sales, regardless, the condition is not so healthy. Price cutting begins to appear and cut-throat competition is on its way. These conditions were particularly in evidence in electric refrigeration sales in 1927.

A good many refrigerator manufacturers, through their local distributor or dealer, have been doing considerable sharpshooting on multiple-unit apartment house jobs. There has been much accusation of unethical practices, knocking of competitors' products and price cutting. Both large and small manufacturers have experienced considerable turnover in dealer representation and there has been a general struggle to get sales volume. In some respects the small manufacturer has been somewhat better off than the large one in having a smaller overhead, a sales and distribution organization that is not unwieldy and his smaller production capacity is proportionately more elastic. On the other hand, the larger manufacturer has the advantage of lower production cost in a large, efficient plant and nation-wide distribution helps to even up the total sales volume when some localities are lagging behind quotas. These conditions have helped to maintain a highly competitive situation which has brought only a fair volume of business, so that if the manufacturer or dealer has broken even he may consider himself well off. The effect of this kind of competition upon the ultimate purchaser of electric refrigeration has not been to stimulate his desire to buy. Rather, it is discouraging in that he assumes an attitude of watchful waiting, believing that he will be able to buy a better machine at a better price later on.

### Central Stations Have Greatest Interest

The central-station companies which have the greatest continuing interest in seeing a large number of their customers purchase electric refrigerators have felt the effect of the existing competition, not only in their own sales but in the total volume of sales in their territory. These companies have also observed with considerable misgiving the consequences of refrigerators sold by dealers who later go out of business and the servicing obligation devolves upon the power company. With this unhealthy condition the local electric utility can have a very stabilizing influence by pushing its own sales to the maximum and in lending its moral support to other refrigerator dealers who have demonstrated their ability and permanence in sales, installations and servicing. Utility companies are well aware of the fact that the competitive conditions so much in evidence during 1927 are not conducive, in the long run, to greatly increased sales volume or in the best interests of their customers. A number of companies have expressed themselves as contemplating some rather drastic steps to stabilize the sale of electric refrigeration in their local territories.

Another element that has concerned the utilities is the sale of commercial refrigeration. There have been a number of misapplications of electric refrigeration in such stores as groceries, delicatessens, butcher shops, etc. A number of companies have set up a department of refrigeration engineering in order that they may be sure that customers purchase proper and adequate equipment to meet their refrigeration needs.

Whether or not 1928 will see the sale of electric refrigeration carried out on a safe and sane basis will depend largely upon the attitude of the electric refrigerator manufacturers, central-station companies and dealers. If they try to expand the market too rapidly there cannot fail to be a continuance of the price-cutting, cut-throat competition seen in 1927. But if the refrigerator manufacturers, as a group, and individual dealers can find a happy middle ground upon which they are willing to develop their business upon a sound and permanent basis the sale of electric refrigeration can be made profitable and the influence of greater confidence on the part of the ultimate user will of itself broaden the market.

## Commission Recommends Purchased Power for Transit System

POSSIBLE economies to be derived from purchasing power from the Edison Electric Illuminating Company of Boston were featured in a valuation report issued recently by the Massachusetts Department of Public Utilities in connection with the future of the Boston Elevated Railway, operated by public trustees under a service-at-cost agreement. The utilities commission said in part:

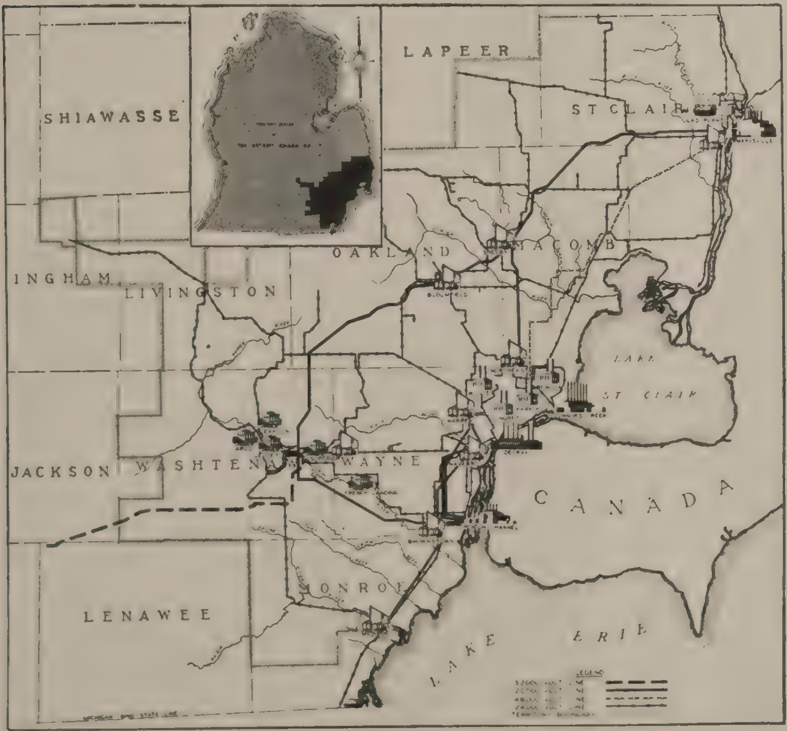
"We understand that the turbines in the [railway] power station at South Boston are adequate to supply all the electricity at present needed by the system. However, the turbines cannot be utilized to their full capacity on account of the inadequacy of the boiler installation and of the cables leading from the plant. As a result the company has maintained five other generating stations, which, to say the least, are not modern plants. With the exception of the Lincoln station, which is operated daily, and the abandoned Dorchester station, these plants are operated infrequently and for the most part in winter, when there are larger requirements for power due to snow and car heating. Probably these plants are not economical to operate. If so, arrangements might well be made to abandon them, to obtain available salvage value, and purchase such electricity as might be needed for the excess requirements of the company. The trend in recent years in this country is toward the purchase of power by transportation companies similar to the Boston Elevated rather than toward increasing their investment in power plants.

"It might be to the advantage of the commonwealth if a purchaser, to abandon all the power plants, salvage as far as possible and purchase all the required electricity. We are led to this conclusion by a consideration of the present cost to the Boston Elevated of its power and the knowledge that undoubtedly electricity could be purchased and delivered at some convenient point at something less than a cent per kilowatt-hour. In 1926 the company generated 290,544,015 kw.-hr. At 1 cent per kilowatt-hour this would cost $2,905,440. It cost the Boston Elevated $3,795,728 to generate its power in 1926, according to the company's annual return to the board, as follows: Power operating expenses, including depreciation, $2,456,104; interest on investment in plants, $826,515, and taxes on power plant equipment, $513,109. Assuming that the property devoted to power production be sold and power purchased, there would be a saving on the 1926 basis of $900,000.

"Tariffs filed with the commission by the Edison company provide for the sale of electricity in quantities of the amount required by the railway company at 8.9 mills plus a coal clause at present amounting to 1.3 mills, or a total of 1.02 cents per kilowatt-hour. The New England Power Company sold all of its electricity during 1926 for an average of 1.23 cents per kilowatt-hour. We believe that if a long-term contract were entered into, the Edison company or some other company selling power would make a price of less than a cent. As the book cost of the property devoted to electrical generation is $15,420,067, this whole amount could be amortized in about seventeen years, assuming no salvage. On the other hand, we are confident that the company could dispose of its power property for about $4,000,000, which would permit of amortization in about twelve years."

---

## Visualizing a Company's System for Its Employees



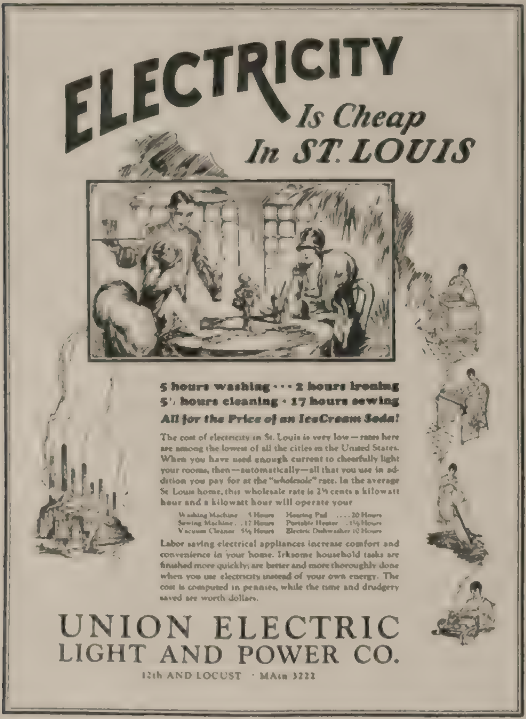
LOCATION OF TRANSMISSION LINES AND GENERATING PLANTS OF DETROIT EDISON SYSTEM

AS POWER companies grow and extend their services into new territory it becomes more difficult for individual employees to know thoroughly the extent of the company for which they are working. From a public relations standpoint, as well as for employees' own information, it is desirable that all should be able intelligently to answer questions concerning the location of power plants, transmission lines and service limits of their company. With this idea in mind, the Detroit Edison Company has prepared a map of its system on which are shown transmission lines of different voltages, the location of all electric generating, steam heat and gas plants, and the whole indicates how the Detroit Edison system serves its territory.

Prints of this map, which is about 25x40 in. in size, have been posted in conspicuous places in the different departments. It was also reproduced and published in the Detroit Edison *Synchroscope* so that all employees might have a copy for their own reference. Since this map was issued it has been found that employees have a much better idea of the Detroit Edison system.

# Teaching Public Low Cost of Energy Usage

DESPITE the fact that the average cost of electricity for residential service has decreased and low follow-on rates have been established by many companies, domestic customers are prone, from a matter of habit, to economize in their use of electric service. This attitude is being effectively overcome by the Union Electric Light & Power Company in St. Louis by development of the thought that "electricity is cheap in St. Louis," which is carried through the company's newspaper advertising and other publicity.



ELECTRICITY
Is Cheap
In ST. LOUIS

**5 hours washing · · · 2 hours ironing**
**5½ hours cleaning · 17 hours sewing**

***All for the Price of an IceCream Soda!***

The cost of electricity in St. Louis is very low—rates here are among the lowest of all the cities in the United States. When you have used enough current to cheerfully light your rooms, then—automatically—all that you use in addition you pay for at the "wholesale" rate. In the average St Louis home, this wholesale rate is 2½ cents a kilowatt hour and a kilowatt hour will operate your

| | | | |
|---|---|---|---|
| Washing Machine | 5 Hours | Heating Pad | 20 Hours |
| Sewing Machine | 17 Hours | Portable Heater | 1½ Hours |
| Vacuum Cleaner | 5½ Hours | Electric Dishwasher | 10 Hours |

Labor saving electrical appliances increase comfort and convenience in your home. Irksome household tasks are finished more quickly; are better and more thoroughly done when you use electricity instead of your own energy. The cost is computed in pennies, while the time and drudgery saved are worth dollars.

UNION ELECTRIC
LIGHT AND POWER CO.
12th AND LOCUST · MAin 3222

EXAMPLE OF LOW COST OF ELECTRICITY

How this thought is being conveyed is shown in the accompanying advertisement, which shows how, after a customer has used the first few kilowatt-hours per active room at the top rate, all additional energy is billed at 2½ cents. The idea of low cost is further emphasized by the use of the term "wholesale" as applying to the lower step in the rate. To illustrate how this applies to the various household appliances the accompanying table of costs of operation and energy consumption has been worked out.

COST OF USING ELECTRIC APPLIANCES IN ST LOUIS

| Appliance | Cost of Operating One Full Hour (Cents) | Estimated Annual Usage Kw.-Hr. | Estimated Annual Operating Cost |
|---|---|---|---|
| Iron | 1.31 | 80 | $1.90 |
| Cleaner | 0.40 | 30 | 0.71 |
| Toaster | 1.07 | 37 | 0.88 |
| Washer | 0.48 | 25 | 0.59 |
| Grill | 1.43 | 38 | 0.90 |
| Percolator | 1.07 | 40 | 0.95 |
| Waffle-iron | 1.43 | 37 | 0.88 |
| Fireless cooker | 1.57 | 120 | 2.85 |
| Heating pad | 0.12 | 13 | 0.31 |
| Fan | 0.18 | 32 | 0.76 |
| Portable heater | 1.43 | 100 | 2.38 |
| Sewing machine | 0.14 | 13 | 0.31 |
| Chafing dish | 1.43 | 15 | 0.36 |
| Water heater (socket) | 1.07 | 30 | 0.71 |
| Milk warmer | 1.07 | 25 | 0.59 |
| Auto radiator heater | 0.36 | 15 | 0.36 |
| Dish washer | 0.24 | 30 | 0.71 |
| Curling iron | 0.06 | 10 | 0.24 |
| Hair dryer | 0.12 | 10 | 0.24 |
| Tank water heater | 5.94 | 1,250 | 29.69 |
| Range | 3.56 | 1,350 | 32.06 |
| Refrigerator | 0.24 | 840 | 19.95 |

With these low operating costs it is shown that electric appliances are the cheapest servants a housewife can hire. The cost of doing this work, it is pointed out, can be computed in pennies, while the drudgery saved is worth dollars.

# Ten Reasons for Better Store Lighting

IN furnishing illuminating engineering consulting service to commercial customers it is the utility's job to demonstrate to the customer that it is economically practicable and advisable for him to make the expenditure necessary to improve his lighting installation. Ten points showing the value of better store lighting to the merchant were enumerated by O. J. Kruse of the Milwaukee Electric Railway & Light Company at the recent commercial section meeting of the Wisconsin Utilities Association as follows:

1. Adds attractiveness and value to even the best of merchandise.
2. Shows the true value of merchandise, thus reducing the returned goods problem.
3. Creates an atmosphere of cheerfulness, which affects customers and clerks alike.
4. Instantly creates an impression of cleanliness, neatness and up-to-dateness upon even the least discriminating shoppers.
5. Overcomes competition by attracting trade from the poorly lighted stores.
6. Saves rent by enabling a store located in the middle of the block to compete with the corner store.
7. Makes it possible to use every foot of floor space and eliminates dingy corners.
8. Brings out the true color and texture of materials, thus eliminating errors in matching goods.
9. Pays for itself may times over, through the increased sales produced by it, for well-lighted merchandise is already half sold.
10. Doubles the attraction and sales power of display windows.

# Electric Ranges Net $50,000 to Seattle Utility

THE ESTIMATED profit to the Seattle Department of Lighting from the sale of electric ranges and energy for their operation, after allowance for liberal range service, is approximately $50,000 a year, according to the annual report compiled by J. D. Ross, superintendent.

The average residence-lighting customer in Seattle uses 420 kw.-hr. per year, for which he pays $16.88. The installation of an electric range raises the average consumption of such customers to 2,563 kw.-hr. per year, and returns a revenue of $63.01. It is estimated that the profit on the energy sold remains almost a constant percentage, so that each additional electric range is the equivalent of three new lighting customers.

During the year covered by this report there were 3,406 ranges added to the city system, of which 2,776 were sold by the department. The total range load amounts to 11,127 installations. This means that one out of every six homes in Seattle is cooking electrically. The range load is doubling every two years and has become very valuable as a domestic revenue producer.

# Letters from Our Readers

## *Time to Clean House*

*To the Editor of the* Electrical World:

The article on "Wiring Materials and Methods" in the Nov. 26 issue of your magazine certainly hits the nail squarely on the head in many respects. While as one of the "oldtimers" I do not fully agree with all the statements, I cannot let this opening pass without presuming to add my "two cents' worth" to the discussion.

When our national wiring methods have reached the stage where, because of pyramiding methods of questionable safety value, the costs have become so excessively high that the average consumer cuts his initial requirements to the bone and every man is his own wiring contractor after "juice" is turned on, it is high time we started to "clean house." If we do the job ourselves we can get rid of the junk and salvage much that is still good and usable. If we don't start, and start soon, then some group of outsiders will, sure as fate, do the job for us. When they start they are going to chuck good, bad and indifferent onto the dump.

The inventive ingenuity of our nation is such that almost before a problem arises some genius has developed a wonderful piece of apparatus to handle it for us. We in general are quick to make use of these multitudinous new devices, but all too often we fail to realize that the new device makes obsolete some other one which once was thought the last word and which because of sentiment or precedent we hate to discard. The natural result to this little industry of ours, which seems never to be able to grow up, is that our systems from end to end are becoming so loaded down with "doodads" and "gimmicks" that both the investment and the operating costs show very distinct signs of becoming top-heavy.

The article in question on wiring methods touches but one branch of the industry, and on this alone we can wear out a whole flock of brooms in just brushing down the cobwebs. Our wiring code of today is being taken far too seriously by both local inspectors and wiring contractors, not to mention engineers and others higher up who are supposed to use judgment in interpreting the code. A job of wiring intelligently done under the real intent of the code is a good, safe job, but it is not by any means the safest or cheapest job.

Just as an example—a few years ago a utility company operating in a certain Middle West city undertook to get the city wiring ordinance modified to require an "all-metal standard" from the point of service attachment to the meter. The object was twofold—first, to prevent theft of unmetered energy; second, to protect against the hazard of tampering with a circuit that had no fuses back of it and on which a short circuit made by the amateur wireman generally meant a hospital case and a damage suit to settle.

After numerous conferences among the utility, the city electrical department and the contractors, initial opposition was broken down and the change agreed to. When the revised ordinance was finally passed by the City Council it required an "all-metal" standard throughout every installation within the city limits with a few minor exceptions. It also required polarized wiring throughout, and today that city has perhaps the best wiring of any city in the country. However, the point is that for frame buildings, where high wiring costs hit the consumer the hardest, knob-and-tube wiring for the branch circuits was plenty good enough and was low enough in first cost to permit ample convenience outlets to be installed. My guess would be that this community is spending at least $100,000 per annum in support of an unnecessary "all-metal" standard. If you think the consumer has been prohibitively handicapped in his use of portable appliances or has had his safety added to, just drop in any of the "five and dime" stores on a Saturday afternoon and watch the land-office business the electrical counter is doing with "Underwriters' approved" fittings.

We need a simplified system of wiring such as that indicated in the article in question, but what we need first is a little common sense in using the systems we already have. After years of argument our code now permits a grounded unfused neutral and three-wire branch circuits. In spite of this it is still required or common practice in many localities to fuse the branch neutrals and run out two-wire circuits—a practice that means distribution cabinets twice as large as necessary, from 15 to 25 per cent excess circuit wire and energy loss double what it need be. On top of this the contractor locates his distribution center so far out of the true load center that the average branch-circuit length is excessive. From $5 to $10 could be cut from most moderate-sized residential wiring jobs if the contractor would plan his layout before he starts work, and if both he and the local inspector would mix 50 per cent common sense with an equal amount of code rule interpretation. We could cut another $5 off the job if we were permitted to use a common neutral throughout the installation and leave off the expensive rubber insulation which we must short circuit by the protective ground on the neutral. We won't try to argue this point—I have been on the wrong side of the fence for thirty years in advocating the grounded neutral, the solid neutral, polarized wiring and a lot more "fool ideas" which are now written into the code. Just as a side bet, you will see the code requiring a bare common neutral—with the wiring channel system, including fixture stems and socket shells, part of this neutral—within the next decade.

In conclusion, while we are trying out other new wiring methods why not give this one a trial: Over a code single-conductor wire wrap a spiral of soft-copper or copper-alloy ribbon for use as the circuit neutral. Over this place a single impregnated braid. Such a conductor would give all the protection needed in locations where knob-and-tube or non-metallic cable is now permitted. For greater protection it could be steel-armored or drawn in conduit of the present or of a new thin-wall type. The neutral ribbon, effectively grounded as now required, would always act as a shield for the "hot" wire of the circuit, would be self-identifying, and could readily be interconnected and bonded to fittings by means of punching with a small hand punch and either bolted together or fastened with eyelets. This form of conductor could be used with present line of outlet boxes designed for flexible non-metallic conduit. Later on, when the industry starts to grow up, perhaps some wide-awake manufacturer will bring out a new line of fittings so that such a shielded conductor will automatically polarize the entire system right through from the main switch to the portable utilization device.

S. Bingham Hood,
Oakland, Calif. Development and Research Engineer.

# Digest of Electrical Literature

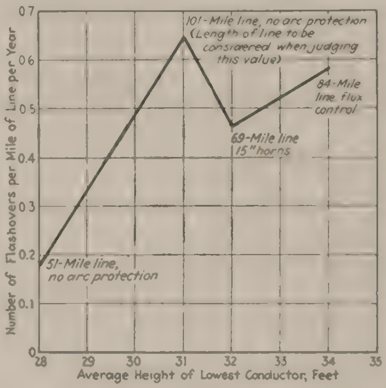
## *Hydro-Electric Development and Steam Equipment*

*The Bunnerong Electric Power Station.* — The rapidly increasing use of electricity in the territory surrounding Sydney, Australia, which is supplied by the Municipal Council, required that provisions be made for future expansion. This station is designed for an ultimate installed capacity of 375,000 kw., but is being constructed at present for 150,000 kw. Six turbo-alternators of 25,000 kw. capacity will feed 21 single-phase transformers for use in stepping up the generator voltage to 33,000. The design will follow modern practice in coal handling by rail and water, steam pressures of 350 lb. per square inch, underfeed stokers and balanced draft equipment being used. The turbines are of the tandem impulse type with multi-exhaust blades on the last low pressure stages. Operating speeds of 1,500 r.p.m. are used and a steam consumption of 10.29 lb. per kilowatt-hour has been specified. The main switchgear is of the iron-clad horizontal drawout type. An imporant feature of the construction of the switch house is that it is entirely sectionalized, the switchgear for each generator group being installed in a compartment of its own, with concrete walls dividing the sections. Access from one compartment to another can be had only by way of the balconies that are built on all floors. The 33,000-volt outgoing feeders from the power station consist of underground cables, communicating with various main substations located throughout the metropolitan area.—*Electrical Engineer* (*Australia*), Dec. 15, 1927.

*Hydro Plant Spullersee* (*Austria*).—A. Hruschka.—The supply of part of the basic load and all of the peak load of the western electrified Austrian main railway lines is furnished by the Spullersee plant. Embodying the latest hydraulic and electric achievements, it not only represents the most modern Austrian hydro-electric installation, but it also has the distinction of utilizing the steepest known penstock line (40 deg.) under a head of 2,600 ft., giving a water pressure at the turbines of about 1,100 lb. per square inch. There are at present three single-runner, single-jet Pelton turbines, each of 8,000 hp. and 333 r.p.m., installed, with an ultimate capacity of three more units. A highly sensitive needle and deflector regulation with remote motor control, specially designed for the unusually high pressure, is an interesting feature of these turbines. Each waterwheel drives a single-phase, 16⅔-cycle generator, with a basic output of 3,000 kva. A load of 5,400 kva. can be carried for 30 minutes, or 7,500 kva. for six minutes. At unity power factor and 7,500-kva. output an efficiency of 95 per cent has been measured at 6,600 volts. This potential is stepped up to the transmission voltage of 60 kv. in 3,000 to 5,400-kva. 16⅔-cycle, water-cooled, shell type transformers, each generator and transformer representing one group. Transformers and the entire switching equipment are installed indoors.—*Elektrotechnik und Maschinenbau*, Nov. 20, 27, Dec. 4 and 18, 1927.

## *Transmission, Substations and Distribution*

*Transmission-Line Lightning Surges.*—R. C. Andersen.—A discussion of the influence of long spans upon the height of line and upon induced lightning surges and of the relative merits of long spans as compared with those of medium length. The author reviews the origin of and experience involved in long-span construction, with particular reference to conditions in Great Britain. The questions of conductor placement and clearances, the method of securing line protection, the ground wire problem, insulator string protection and grounding are all considered. It is stated in conclusion that with modern transmission-line construction there should be relatively little trouble experienced from induced lightning surges. Line height is stated to be a direct function of induced voltage surges, but as the former is under the complete control of the designer, the construction must be so planned that the question of whether it is more economical to use a long span, with its saving in initial outlay but involving possible lightning trouble, or to use the more expensive though more nearly surge-proof medium length span must be decided. — *Electrical Review* (*England*), December, 1927.



FLASHOVERS ON A 140-KV. SYSTEM

*Extra High-Tension Transmission Lines.*—S. Edgar Barratt.—A review of the leading overhead power transmission lines of the world. The subject of insulators, towers, conductors, etc., in various countries, with specific reference to a number of outstanding power lines, is offered in this article. A table of conductor spacings offers interesting comparisons between the practices in various parts of the world.—*World Power (England)*, December, 1927.

## *Units, Measurements and Instruments*

*The Measurement of Intensive Magnetic Fields by Means of the Zeeman Effect on the Zinc Triplet.*—Walter C. Michels.—A plan for utilizing the relation discovered by Zeeman some years ago between magnetism and light has been utilized for the measurement of intensive magnetic fields. A review of the available methods of measurement as well as of the one particularly concerned in the discussion and a comparison of their relative merits is offered. The basis for the computation depends upon the fact that light, viewed normally to the field, produces three observable components, the two outer being plane polarized normally to the field and the middle in a plane at right angles to these. When the light is viewed along the lines of force, two components appear circularly polarized in opposite directions. The probable error in using this method amounts to less than 1 per cent. The measurement of intensive magnetic fields by the application of the Zeeman effect on the zinc triplet has several distinct advantages; no apparatus beyond that ordinarily found in any well-equipped physics laboratory is required; the only standards used are the wave-lengths of certain spectral lines, which are known to a high degree of accuracy and are always available; the results are capable of a high degree of accuracy, with good apparatus and proper manipulation, and by the use of a short spark the entire air gap may be explored and an accurate map of the field may be made.—*Bulletin* 17, *Rensselaer Polytechnic Institute.*

*Investigations on Shunted Current Transformers.*—K. Berger.—It is not unusual to experience flashovers, punctures or grounds on current transformers which are installed near the entrance of lines to a substation. They are stated to be due to overvoltage phenomena, arising from incoming waves, which may set up oscillations and resonance. A suggested remedy is the shunting of the primaries of such current transformers with bridging ohmic resistors. If the transformer is used to measure current the bridging shunt will introduce incorrect indication because it changes the transformation ratio and adds angular fault. Better results can be obtained if the bridging resistor has a characteristic which changes with the impressed voltage. Many laboratory tests were made to study the effect of such shunts for frequencies up to 100,000 cycles and to determine under what conditions resonance occurs with certain cable length next to the transformer. The author believes that probably the best solution will be to bridge the transformer primary with a spark gap in a low pressure gas atmosphere. Laboratory tests were made on six current transformers, with and without overvoltage protection.—*Bulletin de l'Association Suisse des Electriciens,* November, 1927.

## *Motors and Control*

*Starters for Squirrel Cage Motors.*—W. E. Rogers.—A device which permits the starting of squirrel cage induction motors without the use of compensators and which nullifies all possible objections of utility men in connection with the starting characteristics of the motor has been developed under the direction of the author. The underlying principle is an adaptation of the autotransformer starter for polyphase closed rotor motors, the main principle being to provide an infinitely variable choke at starting in each phase of the motor insuring perfect gradation in regard to current increments taken from the line by any appropriate motor, and proved by actual no load tests to be theoretically correct. The starter is provided with two adjustable damped overload trips, one in each phase, and a one-motion pendulum type of no-voltage attachment. The construction of this equipment is said to be such that operating errors may be eliminated from consideration.—*Electrician (England),* Jan. 13, 1928.

## *Traction*

*Operation and Performance of Mercury-Arc Rectifiers.* — Caesar Antonono.—Operating results and experiences obtained with the installation of mercury-arc rectifiers for direct current railway supply as used by the Chicago, North Shore & Milwaukee Railroad Company are outlined by the author. The factors considerd are efficiency, capacity to absorb momentary overload, insensibility to short circuits, lack of synchronizing characteristics, simplified operation and minimized attention, lack of noise and vibration, low maintenance cost, and reliability of service. In the opinion of the author, the mercury-arc rectifier has proved its value for such service, and it is anticipated that within ten or fifteen years a large application of such devices will be evident in the industry. While present costs are greater for the rectifier than for the converter, the increasing number of installations, and the co-operation of manufacturers and users in connection with the development work are foreseen as speeding up progress in this connection and producing a reduction of production costs. —*Journal of the American Institute of Electrical Engineers,* January, 1928.

## *Illumination*

*Airway and Airport Lighting.*—The illumination of landing fields and the installation of airway beacons on the Pacific Coast, under the supervision of the Department of Commerce, have been undertaken. The four types of beacons used and the details of the fixtures found to be desirable for this class of service are given. Emergency field lighting requires special devices, the requirements of which are outlined. Essential features are said to include beacons to indicate from a distance the location of the airport; an illuminated outline of landing fields; an indication of favorable approaches; indication of landing hazards; an arrangement to indicate by proper lighting values the height of buildings and structures so that the pilot may estimate how far he is above the ground; illuminated wind cone; good ground lighting; and a searchlight for use in foggy weather.—*Electrical West,* Jan. 1, 1928.

*Symposium on Office Lighting.*—The many factors involved in the satisfactory illumination of office space have been reviewed by several authors in this symposium of office lighting. The considerations have been developed under the various headings of indirect lighting, inclosed semi-indirect lighting, prismatic semi-indirect equipment, open type semi-indirect luminaries and direct lighting inclosing globe equipment. Photographic illustrations and charts indicate the comparative values of the several types mentioned. It is stated that an illuminating engineer of an electric service company will probably have occasion to recommend, for office lighting, every one of the types presented and that no one of them will be found preferable for all conditions.—*Transactions of the Illuminating Engineering Society,* January, 1928.

## *Electrophysics, Electrochemistry and Batteries*

*Influence of Internal Vacua and Ionization on the Life of Paper-Insulated, High-Tension Cables.* — Alexander Smouroff and Leo Mashkileison.—As a result of investigations conducted by the high-voltage laboratory of the Electrotechnical Institute in Leningrad the authors have reached some interesting conclusions in connection with high-tension cables. The research was especially directed toward the influence of internal vacua and ionization and the life duration of paper-insulated, high-voltage cables and toward an investigation designed to clarify the conditions under which such vacua may occur. Three probable causes of the appearance of internal vacua are recognized as: Temperature changes after installation of the cable; residual deformations, and changes in chemical structure in the impregnating compound under the influence of ionized air. The object of the research was to clear up inadequate determinations concerning the formation of internal vacua and to ascertain the values more closely, as well as to investigate the life duration of the cable under the influence of such vacua. The authors suggest, as the result of this investigation, the use of chemically stable compounds, the arrangement of free ducts in the interior of the cable for air to maintain the atmospheric pressure at that point, the arrangement of free air ducts in the interior of the cable and in the splices for compensation of vacua, the pumping of dry air through ducts in the core of the cable to maintain pressure, or the filling of a cable with transformer oil forced under pressure at the splices of a cable.—*Journal American Institute of Electrical Engineering,* January, 1928.

## *Telegraphy, Telephony, Radio and Signals*

*Pictures by Wireless.*—A. J. Smith. —A brief outline of recent developments in the transmission of pictures by wireless. The difficulties involved in telephotography are enumerated and the specific solutions developed for the elimination of these difficulties are reviewed. The equipment considered employs an annular photo-electric cell. The elimination of time-lag and the perfection of synchronization have been accomplished in the development of this apparatus. It is stated in conclusion that the equipment with which tests have been carried out and which would be used for overseas sending is a 20-kw. short wave transmitter and that the size of the picture would be a maximum of 4x8¾ in. The latest information available is stated to offer a reasonable speed of transmission of twenty seconds for an image measuring 4 in. x 4 in.—*Electrician (England),* Jan. 13, 1928.

## *Miscellaneous*

*The Deflection of Flat Pieces Fixed at the Circumference.*—H. Carrington. —The deflection of elastic materials circumferentially fixed has been investigated by the author both experimentally and mathematically. As a result of the information developed it is concluded that for circular elastic plates deflected by uniform pressure Poisson's theory ceases to be applicable because of the influence of strain upon the metal surface. This is of special significance in the case of thin plates where central deflections comparable to or greater than the thickness are possible without exceeding the elastic limit of the material. It is also probably of equal significance in some cases of the bending of thin curves, plates or shells. Prescott's approximate method for determining the central deflection gives results which agree very closely with those obtained in these experiments. If a plate is deflected by air pressure it was found that the influence of strain in the metal surface causes an increase in the frequencies of lateral vibration. This becomes marked as the ratio of central deflections to thickness increases. —*Engineering (England),* Jan. 13, 1928.

# Book Reviews

## *Steam Turbines*

By E. F. Church, Jr. McGraw-Hill Book Company: New York. 273 pages, illustrated. Price, $3.

A text for colleges covering briefly the details of modern steam turbines is a large undertaking, and even larger is an attempt to give a condensed treatment for text-book purposes. The author has called upon his teaching experience to make a very good presentation of his subject. He deals with turbine types and their characteristics, the flow of steam in nozzles, turbine blading, losses, efficiency and performance, governing, variable-load operation and design principles.

Good illustrations and problems at the end of each chapter help greatly to make the principles clear in the minds of the students. The treatment is fundamental and is held to basic principles and their application. Mathematics is used when and where needed to develop the theory and no attempt is made to give a thorough course in thermodynamics as part of the text. This should be a welcome text for juniors and seniors in American colleges.

## *Overhead Electric Power Transmission Engineering*

By William T. Taylor. London: Charles Griffin & Company, Ltd. 527 pages, illustrated.

A very great amount of time and labor has been spent by the author of this book in the compilation of data, the making of charts and the search for records in all parts of the world, in order to write an engineering treatise on transmission. His work covers economic, design, construction, operating and maintenance features associated with transmission lines. General developments in transmission and an evaluation of the factors included in transmission systems serve to lead into the more detailed chapters. Survey and location of line, conductor characteristics, stress, temperature and sag details, transmission telephone lines, steel-tower lines, wooden-pole lines, insulators, line erection, line protection, costs of lines and line operation are some of the topics treated in detail. Good photographs and a fine series of tables and charts make this book replete with definite material. It is not a mathematical or theoretical text; the author aimed to present a practical engineering treatment of the subject.

In many respects the book is written from the point of view of the English engineer, and some of the opinions given and some of the data presented would be modified by experiences in this country. But there are more transmission-line data of a practical character in this volume than in any other now available. Controversial opinions on methods of line protection and other matters do not obscure the value of the many very valuable data and many engineering opinions and experiences. American engineers can well afford to add this book to their transmission shelf.

## *Electrical Power Transmission*

Principles of Design and Performance. By E. A. Loew. New York: McGraw-Hill Book Company, Inc. 388 pages, illustrated. Price, $4.

Professor Loew has written a splendid text on transmission. It reflects a thorough knowledge of principles and a great amount of practical experience in line design. So much has been written on the subject that little that is new can be expected in the treatment of fundamental circuit equations. Differences in treatment are found largely in the degree of thoroughness, the arrangement of material and the balance or weight given to various elements. The letterpress is well arranged and is notable for its very direct mathematical approach to line problems. Hyperbolic functions for circuit equations and a thorough solution of the catenary for the line design are features of the book.

The first seven chapters discuss and develop the mathematical tools and the electrical circuit theory of transmission. Very little material is given to approximate solutions. In the last part of the book mechanical features of line design are developed, line economics are discussed and illustrative examples are used to make the material tangible. A good indication of the modern aspects of transmission is found in the chapter on power limits and stability of transmission systems. This chapter is an excellent résumé of the theory as at present developed. The book should be welcomed by many transmission engineers who desire basic information. It gives the mathematical tools to apply to rigid line analysis and design and shows how to use them to best advantage.

## *Regelung und Ausgleich in Dampfanlagen*

By Th. Stein. Berlin: Julius Springer. 389 pages, 240 illustrations.

The marked changes that have taken place in the layout of plants for the generation and utilization of steam, involving on the one side automatic control of fuel and air supply to meet changing conditions of load and on the other side the growing use of steam accumulators, as well as combinations of power, heating and process work, render a treatise that surveys the entire field of steam control most timely. The present volume combines, in good balance, practice and theory. It is an engineer's treatise, primarily designed, as the preface states, to present to the operator a unified view of the means whereby the steam supply is caused to adapt itself to the varying demands of the load. This calls for a consideration not only of the devices themselves, such as interlocking regulators, stokers, blowers, pulverized-fuel supply, throttling and reducing valves, but also of thermal and economic problems. The effect on plant efficiency of carrying short-time peaks on stored steam rather than by firing up additional boilers, the placing of a heat process between power stages, and the maintaining of closely regulated temperature in connection with chemical processes, are some of the topics treated. The heat engineer, whether his specialty lies in the field of design or of operation, will find much to interest him in this treatise on an important subject.

## Book Notes

TRADE ASSOCIATION ACTIVITIES. By Irving S. Paull, I. M. Millard and James S. Taylor. Washington, D. C.: United States Government Printing Office. 381 pages. Price, 75 cents.

An outline of the organization problems of trade associations and the way in which these are commonly met, the methods of financing association activities, the legal status of statistical activities, simplification and standardization in industry, public relations and co-operative advertising, trade relations and arbitration, traffic service, industry and public utilities, banking and insurance activities.

LES MOTEURS À COURANTS ALTERNATIFS. By L. Lagron. Paris: Librairie Scientifique Albert Blanchard. Paper, 429 pages, 211 illustrations and diagrams. Price, 25 francs.

This publication, No. 2 in the Nouvelle Encyclopédie Electromécanique, published under the direction of E. Pacoret, who, like the author, is a French electrical engineer of recognized standing, covers the theory, design, construction and application of synchronous and asynchronous alternating-current motors. Particular attention is bestowed upon polyphase and single-phase induction and repulsion motors. Among the fifteen chapters, liberally sprinkled with illustrations, diagrams and mathematical formulas, representative titles are: "Losses and Output of Induction Motors," "Heating of Induction Motors," "Starting and Speed Control of Polyphase Induction Motors," "Compensation in Alternating-Current Installations" and "Speed Control of Induction Motors by Means of Cascade Coupling."

MECHANICAL WORLD ELECTRICAL POCKET BOOK. Manchester, England: Emmott & Company. 338 pages, illustrated. Price, 1s. 6d. net.

This book contains electrical calculations in which the method of attacking various problems is set out in detail, various examples being given to elucidate the methods employed. Other sections deal with estimating for wiremen, and the use of electricity in textile mills. Various new tables are given on power consumption of electrical appliances, energy taken by electric motors, lead batteries and insulated copper conductors.

## Book Received

*Theorie der Wechselstromubertragung.* By Dr. Hans Grunholz. Berlin: Julius Springer. 218 pages, illustrated.

## Trade Body May Yet Be the Investigator

### Amendment to Substitute It for a Senatorial Committee in Utility Inquiry Has Chance—Muscle Shoals and Boulder Dam Pursue Their Uneven Tenor

By Paul Wooton
*Washington Correspondent of* Electrical World

As this is written, the Walsh resolution, proposing a searching investigation into the operation and financing of electric and gas utilities, is expected to come up momentarily on the floor of the Senate. An amendment will be offered by Senator George of Georgia providing that the Federal Trade Commission conduct the inquiry rather than a special committee of the Senate. The amendment is expected to prevail.

While the committee on interstate commerce amended the original Walsh resolution so as to confine it to companies engaged in interstate activities, it is recognized that under the amended measure the special committee would find it difficult to stay on its own wave length. There is a difference of opinion among the state public service commissions as to the desirability of an investigation such as would be authorized were the resolution, as amended, to pass. The fact that state lines are recognized in an emphatic way, resulting from the refusal of the interstate commerce committee to report favorably on the resolution originally submitted, is thought to be pleasing to all the state commissions, but some of them fear that an investigation, even of the type approved by the committee, will encroach upon state sovereignty.

The hearings before the interstate commerce committee have done much to allay the fear that an investigation will depress the price of securities. Such a good showing was made as to the fundamental value of these securities, and the case of Senator Walsh was revealed to be so circumstantial and indefinite, that there now is little apprehension, it is said, of any material depression of prices.

### Norris and Muscle Shoals

Four members of the Senate committee on agriculture voted against reporting favorably the resolution of Senator Norris providing for the completion of the government power plant at Muscle Shoals and for the sale of the power to the highest bidder, accruing revenues to be used for the construction of fertilizer plants, one of which is to be at Muscle Shoals; for the manufacture and distribution of fertilizer, and for experimentation with a view of cheapening the production costs of fertilizer materials. The dissenters were Senators Keyes of New Hampshire, Gould of Maine, Ransdell of Louisiana and Heflin of Alabama. It is certain that strong opposition will be encountered when the resolution reaches the floor of the Senate. The measure would be approved very generally were it not for a provision authorizing the Secretary of War to build transmission lines. Ostensibly this is for the purpose of placing the Secretary of War in a position where competitive bidding can be assured. Senator Norris, however, is suspected of wanting to build up a hydro commission in the Tennessee Valley, and it is feared by those who do not want to see the government in the power business that this might be the entering wedge. This opinion was strengthened when on Feb. 7 Senator Norris introduced an amendment to his resolution providing that the Secretary of War may contract with any state, county, municipality or other public or co-operative organization, not organized for profit, for the sale of electricity for a term not to exceed twenty-five years.

In reporting out the resolution the majority of the commission subscribes to the view that "it would be the height of folly and useless expenditure of public money to use the valuable power at Muscle Shoals for the operation of Nitrate Plant No. 2 in the production of fertilizer, when it is so clear that the same results can be obtained so much more economically and at so much less financial investment and expense by using the modern methods now known to the scientific world. Extraction of nitrogen from the air has reached such a point of development that power is but an incident in the process. In the erection of a plant cheap coking coal is of much more importance than cheap power."

After the ways had been greased for the prompt passage by the House of the Madden Muscle Shoals bill, the military affairs committee found itself unwilling to indorse the bill as submitted and, as this is written, no agreement on amendments is in sight. One member of the committee expresses the opinion that the committee will have to bring out a public operation bill.

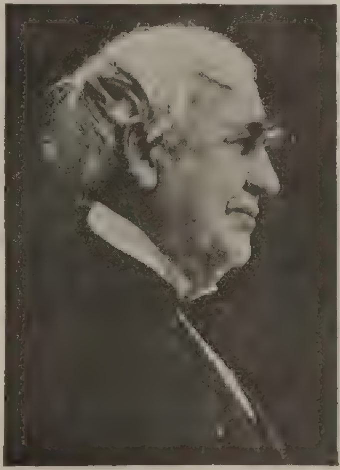
### Boulder Dam Bill in House

The House committee on irrigation and reclamation on Feb. 3 reported out the Swing Boulder Dam bill with the reservation that the report is not to be filed until March 15, in order to give the Colorado River commissions of the seven interested states a final opportunity to come to an agreement. It was learned that there were four members of the committee against the measure – Representatives Douglas of Arizona, Leatherwood of Utah, Allgood of Alabama and Winter of Wyoming.

Mr. Winter's vote was something of a surprise as the members of the committee had for the most part put him down as supporting the bill. Explaining his vote, Mr. Winter said that the measure does not allow the states sufficient time to effect a settlement between themselves. He added that he is fundamentally opposed to government ownership except as a last resort.

The members of the Federal Power Commission—the Secretary of War, the Secretary of the Interior and the Secretary of Agriculture—have addressed a communication to Representative James S. Parker, chairman of the House committee on interstate and foreign com-

## Edison Eighty-one Years Old



Today, Feb. 11, is the eighty-first anniversary of the birth of Thomas A. Edison. The inventor will spend it at his winter home in Fort Myers, Fla., where he has been for some time. He will therefore not be able to be present at the annual banquet of the Edison Pioneers, which, however, will be held as usual. It will take place at 12.30 p.m. at the Hotel Astor, New York. President William H. Meadowcroft will preside. A guest of honor will be "Chief" Isaac Krall, approaching his eighty-fifth year, an employee of the New York Edison Company, a long-time associate of Thomas A. Edison and one of the first chief engineers of the world-famous Pearl Street station.

merce, recommending favorable consideration of a bill to authorize additional employees for the commission. The letter asserts that when the commission was created in 1920 responsibilities many times greater than those connected with water power which had previously been placed upon the three executive departments were placed upon it, but that it was "given no personnel with which to perform its work. In consequence, it has been necessary for the commission to leave the greater part of its duties unperformed."

# William C. L. Eglin Dead

## Vice-President and Chief Engineer of Philadelphia Electric Company, Moving Spirit in Conowingo Development, Five-Time President of Franklin Institute

FATAL termination to the nervous ailment contracted by William C. L. Eglin, vice-president and chief engineer of the Philadelphia Electric Company, while on a cruise in the Caribbean Sea four weeks ago, of which illness note was made in the ELECTRICAL WORLD last week, came on Tuesday evening, Feb. 7, in Jefferson Hospital, Philadelphia, whither he had gone after a hurried trip from Cuba. His death removes one of the eminent electrical engineers of the nation and a man whose varied activities in connection both with the promotion of science and the extension of electrical service had brought him wide public recognition as well as professional eminence. Of recent years the outstanding part played by him in advocating and designing the great hydro-electric plant of the Philadelphia Electric Company, now well on its way to completion, had brought to him fresh distinction, and his election as president of Philadelphia's famous Franklin Institute for five consecutive terms had also added to his laurels.

William Charles Lawson Eglin was born in Glasgow, Scotland, on July 14, 1870, and was the son of a leather merchant. He was educated in the Andersonian University of Glasgow and at the West of Scotland Technological College. As a youth he assisted Rankin Kennedy in his early experimental work on alternating-current generators and transformers. He came to America in 1888 and in the following year went to work for the Edison Electric Light Company, one of the smaller companies that were combined in the 1890's to form the Philadelphia Electric Company. After the consolidation he remained with the latter, of which he was made electrical engineer, until his death. The amalgamation necessitated the standardizing of power-station equipment and distribution methods throughout the city in order to establish a unified and economic system, and all this work was designed and accomplished under Mr. Eglin's direction. The design successively of the five great steam-electric plants built by the company in the city and its environs was also his work, and about three years ago he turned with equal facility to planning the hydro-electric plant on the Susquehanna River, just across the Maryland border. The combined rating of the steam stations is now 575,000 kw., and to this next fall Conowingo will add 378,000 hp.

WILLIAM C. L. EGLIN

Mr. Eglin was made a vice-president of the Philadelphia Electric Company in 1922. Besides his work as chief executive engineer in charge of the company's engineering and operating departments, he took an active part in all matters relating to the company's progress and gave especial attention to the various educational and beneficial organizations within the ranks of the employees. Mr. Eglin also contributed to the proceedings of the Association of Edison Illuminating Companies and of the American Institute of Electrical Engineers. He was a fellow of the Institute and had served both as a manager and as a vice-president. In the National Electric Light Association he occupied successively the offices of secretary and treasurer, second vice-president and president. During his term as president (1908-1909) the membership more than doubled. The establishment of company sections was effected in his administration, and he remained until his death closely identified with the policies of the association.

In 1890 Mr. Eglin served at the International Engineering Congress held in Paris as the representative of the Engineers' Club of Philadelphia and the Franklin Institute. He was first elected president of the Franklin Institute for 1924. He was the author of a number of engineering papers and reports—notably on the steam turbine—and of a lecture, "The Power Company and the Distribution of Electrical Energy," which he delivered before the undergraduates of various colleges as a means of drawing their attention to electrical engineering as a vocation. He also made an intimate study of the relations that should prevail between the employees of the industry and their employing companies, and in a paper, "The Personnel of the Industry," presented before the 1919 convention of the Association of Edison Illuminating Companies, he offered, as the logical and rational solution of this problem, a carefully designed plan of education and advancement that would be applicable to all grades of men in the industry.

The University of Pennsylvania, Swarthmore College and other institutions had conferred honorary doctor's degrees upon him. Besides the technical associations already alluded to, he was an associate member of the Edison Pioneers and a member of the Illuminating Engineering Society, the American Electrochemical Society and many social, scientific, business and fraternal bodies. Mr. Eglin was unmarried.

Funeral services were to be held on Friday afternoon at the Woodland Presbyterian Church, Philadelphia.

# Water-Power Jurisdiction to Canadian High Court

## *Its Dictum and United States Views Awaited at Ottawa Before Taking Up St. Lawrence Question—Quebec and Ontario Hydro Resources*

PREMIER KING of Canada made it clear at Ottawa when the Canadian Parliament opened that negotiations with the United States over the St. Lawrence deep waterway and power development project will not be hurried. The Premier announced also that the question between federal and provincial jurisdiction over water-power rights had been referred to the Supreme Court of Canada. Seven questions covering the whole field respecting both power and navigation are included in the agenda with which the court will have to deal. One of the principal questions is: Has the Dominion exclusive legislative control over the proprietary interest in water powers brought into being by works authorized by Parliament to be erected in an international stream for purposes of carrying out an agreement between Canada and any foreign country looking to the erection of joint works for the improvement of navigation in such stream? If not, what are the powers and rights of the province with regard to such water powers?

It was stated further by the Prime Minister that a dispatch was to be sent to Washington to ascertain the view of the United States government on certain phases of the project, and that until the views of that government had been received it would be impossible for the Canadian government to say whether or not negotiations were going to be possible for the construction of the international waterway. In the meantime the relative situation of Ontario and Quebec in respect to power development is receiving a good deal of consideration in the capital. An examination of the reports of the engineers concerning the St. Lawrence shows Ontario to be in a position of inferiority when compared with Quebec on the basis of hydro-electric power resources. The total potential power available in Quebec is very much greater than that available in central Ontario, leaving aside those powers which are too far north to be of any practical immediate interest. The view, therefore, persists that Ontario will be obliged to look to Quebec for future supplies of power.

Ontario's attitude, however, is that no power shortage whatever is feared, and the twentieth annual report of the Hydro-Electric Power Commission strikes this optimistic note. The report shows that progress during the last fiscal year, ended Oct. 31, 1927, was in no respect inferior to that of former years. Since 1908, when the first supply of electricity was obtained for the use of the co-operating municipalities of the Niagara system, demands for power have so increased that at the end of October last the power supplied by the commission aggregated 949,700 hp. In spite of this, the commission expresses confidence that sufficient power will be available from developments within the province to meet demands for some years to come. The commission has in mind the exploitation of several important undeveloped sites on the Ottawa.

A bill to regulate the exportation of electric power has had its first reading in the Canadian House of Commons. Its object is to amend the present law, which provides that licenses for the export of electric power are to be issued by the Governor-in-Council. Under the bill just introduced licenses can issue only by authority of Parliament and on the terms which Parliament lays down. Nothing in the bill in any way affects the rights of the provinces.

## New England Engineers Meet

With a registration of 150, the Engineering Section of the New England Division of the N.E.L.A. met at Boston, on Feb. 7-9 to discuss current problems and visit plants and factories in the metropolitan district. T. H. Haines, chairman of the section, presided. Among the leading topics and speakers on the program were: "Modern Street Lighting Practice," presented by engineers from the General Electric and Westinghouse companies; "Flood Conditions in New England," S. S. Kent and H. B. Kinnison; "Totalizing and Remote Metering," Harry S. Baker, Hydro-Electric Power Commission of Ontario, and "Obtaining Maximum Steam-Plant Capacity," Vern E. Alden, Stone & Webster, Boston. A. H. Kehoe, chairman national electrical apparatus committee, was to speak at luncheon Wednesday.

## Michael I. Pupin Honored by Technicians

*Western Society of Engineers and the Four Founder Societies Confer Washington Award for Advancement of Human Progress Through Engineering*

IN RECOGNITION of his eminent service in advancing human progress through engineering the Washington Award was tendered to Dr. Michael I. Pupin, professor of electromechanics at Columbia University and former president of the American Institute of Electrical Engineers. at a brilliant dinner given in his honor at the Palmer House, Chicago, on Feb. 2. Nearly five hundred scientists and engineers attended the presentation of the award, which was founded by John Watson Alvord and is administered by the Western Society of Engineers on the recommendation of a commission representing this and the four founder societies—civil, mining, mechanical and electrical.

*"P. & A. Photo."*

DR. PUPIN RECEIVES AWARD FROM R. F. SCHUCHARDT

In the presentation speech R. F. Schuchardt, Commonwealth Edison Company, official nominee for president of the A.I.E.E. and chairman of the Washington Award commission, paid high tribute to Dr. Pupin as scientist, inventor and teacher, telling how he came to America as an immigrant boy more than fifty years ago and worked his way through Columbia University. "Great as have been Dr. Pupin's attainments in the scientific world," said Mr. Schuchardt, "of equal importance is his literary ability. One of his most outstanding accomplishments is that revealing book 'From Immigrant to Inventor.'"

Major Rufus W. Putnam, president of the Western Society of Engineers, told of the founding of the award in 1916 and named the six men who had previously received it, these being Herbert Hoover, Robert W. Hunt, Arthur N. Talbot, Jonas W. Smith, John W. Alvord and Orville Wright.

Greetings and addresses of appreciation dealing with Dr. Pupin's achievements were delivered by Dr. A. N. Talbot, past-president of the American Society of Civil Engineers; Dr. William Kelly, past-president of the American Institute of Mining and Metallurgical Engineers; John L. Harrington, past-president of the American Society of Mechanical Engineers, and Bancroft Gherardi, president of the American Institute of Electrical Engineers and vice-president and chief engineer of the American Telephone & Telegraph Company. Mr. Gherardi dwelt on Dr. Pupin's development of the loaded telephone circuit, which permitted the use of cables for long-distance telephony and without which the present nation-wide system of communication would have been impossible. Among his other important electrical inventions and developments have been the radio-tuned circuit, rectification of alternating current and X-ray photography. Prof. Arthur Compton, Nobel prize winner last year, spoke for President Max Mason of the University of Chicago.

Dr. Pupin received an ovation as he rose to voice his thanks in his inimitable manner. "I accept this award," he said, "in the hope that it eventually will find its way to the Belgrade Museum, to show Serbian youth that they can come to this country and by their own efforts earn the appreciation and approval of its most distinguished citizens." He said that long-distance telephony "has transformed Chicago and New York into one community" and foresaw in it a factor for world peace, because nothing is so conducive to friendship as thought expressed by the living voice.

## Northwest Inspectors Listen and Deliberate

Continuing its deliberations at Seattle on Friday and Saturday, Jan. 27 and 28, the third annual convention of the Northwest Association of Electrical Inspectors, whose first day's events were reported last week (page 268), listened to well-known speakers and heard and discussed committee reports. H. B. Kirkland, Society for Electrical Development, New York, discussed the uniform electrical ordinance; John A. Laing, vice-president Pacific Power & Light Company, Portland, touched on inspection from the standpoint of operating companies; a cure for the fuse-abuse problem was suggested by L. W. Going, chief electrical inspector of Portland, while his associate, J. C. Caine, made a plea for municipal control of electrical equipment; F. W. Carlson, Seattle manager of the Crouse-Hinds Company, read a paper on grounding written by S. W. Borden, grounding engineer of that company, and C. W. Charlton, engineer Electrical Products Corporation, Seattle, gave a technical description of neon signs.

Committee reports brought out a number of points on which the Northwest association desired to make recommendations to the electrical committee of the N.F.P.A. covering revision of the National Electrical Code. At the banquet on Friday night W. D. Shannon, general superintendent at Seattle for Stone & Webster, spoke. H. A. Patton was elected president and T. W. Carlon vice-president.

# Purchases and Mergers

*New England Power Association Takes Over Lowell Electric Light Corporation—Consolidation Planned in Cincinnati—New England Public Service Still Buying*

ACQUISITION of the Lowell (Mass.) Electric Light Corporation by the New England Power Association took place at a stockholders' meeting held last week in Boston. John A. Hunnewell, for the past twenty-two years manager of the company, has been elected president and will sever his connection with the organization of Stone & Webster, Inc., which has been executive manager of the company for about 30 years. The following directors have been elected: F. C. Church, J. C. Reilly, E. J. Gilmore, C. B. Stevens, C. M. Runels, E. B. Carney, J. A. Gagnon, H. I. Harriman, Philip Young, C. W. Rice and Philip Spaulding. Carl S. Herrmann of the New England Power Association has been elected treasurer. Under the new arrangement the Perry Street steam generating station of the Lowell company will be interconnected with the transmission system of the New England Power Company through a substation at Wamesit. The Perry Street station has a rating of 35,400 kw.

Charles D. Jones, president of the Cincinnati Gas & Electric Company, is quoted as admitting that his company has plans to unite the Cincinnati Gas & Electric, Columbia Power and Union Gas & Electric companies under the name of the Cincinnati Gas & Electric Corporation. Stockholders of the merged companies are to receive share for share of their stock in exchange for 5 per cent preferred stock of the new company. Cincinnati Gas and Union Gas are now under 99-year lease to the Columbia Power, but under the present plan the new company is to take over actual ownership of all three properties, according to Mr. Jones.

The New England Public Service Company has purchased the Tilton (N. H.) Electric Light & Power Company at a reported price of $900,000. The company owns a power plant on the Winnipesaukee River and a transmission line is being built to connect it with the Public Service plant on Lake Winnisquam. It is predicted that the Hill Light & Power Company, operating between Franklin and Bristol, will also be acquired by the New England Public Service Company.

No step to comply with the statute requiring the approval of the North Dakota Railroad Board for all public utility mergers and consolidations has been taken by the Hughes Electric Company of Bismarck and the Northern Power & Light Company of Mobridge, S. D., Frank Milhollan, president of the board, asserts. An announcement by E. A. Hughes, reported Jan. 28 (page 220), said that the consolidation had been arranged. Mr. Milhollan points out that the merger will not be legal without the approval of the board.

The Otter Tail Power Company has purchased the electric plants and transmission lines at Garfield and Brandon, Minn. At an election held at Brandon the proposal to sell was carried by a vote of 56 to 1.

The People's Power Company of Moline, Ill., has secured an option on the Rock River Valley Light & Power Company of Hillsdale, Ill., which has a power line running to Silvis.

Sale of the municipal electric plant at Willacoochee, Ga., to Naumann, Hall & Burrus, who recently bought the plant at Alma, Ga., is reported.

Lease for 22 years of the Bell Island power plant of the Oklahoma Railway Company by the Oklahoma Gas & Electric Company is announced by the latter. The lease includes three 33,000-volt transmission lines to Norman, Guthrie and El Reno, Okla.

Consolidation of the street railway companies in Washington, D. C.—the Capital Traction Company, the Washington Rapid Transit Company and the Washington Railway & Electric Company—is thought to be imminent. The last named controls the Potomac Electric Power Company and the Braddock Light & Power Company.

# "Electrical World's" London Letter

## National Electric Week—Interconnecting "Grid" Contract Placed—Electricity Commissioners' Report—Radio Versus Submarine Cables—Industrial Developments

By Bernard C. Holding
Editor of *The Electrician*

London, Feb. 1, 1928.

DECEMBER was a month more than usually full of important electrical happenings. It saw the successful completion of the first National Electric Week to be organized in this country, and it also saw the placing of the contract for the first portion of the national interconnected transmission network and the issue of the annual report of the Electricity Commissioners.

Of the actual results of the National Electric Week it is at this writing too early to speak authoritatively, but there is pretty general agreement that the effort was well worth while, and there is a widespread desire for the arrangement of a similar event next year.

The contract referred to, which is worth approximately $2,000,000 and which has been let to British Insulated Cables, Ltd., is for material required for the Central Scotland Electricity Scheme and calls for the supply of 29 route miles of double-circuit and 199 route miles of single-circuit overhead transmission lines, about 1,500 steel towers and 1,000 miles of aluminum-steel conductors and earth wires.

As was only to be expected, the Electricity Commissioners' report reflects the adverse effect of the 1926 coal strike upon both output and operating results of British supply undertakings, and while the total units generated (8,365,857,198 kw.-hr.) shows an actual increase in output, the rate of growth fell much below the figures attained in preceding years. The actual increase over the year 1925-6 was less than 3 per cent, and instead of the increased output involving a smaller pro-rata increase in fuel consumption, as in former years, the amount of coal (8,493,810 tons) and coke (217,217 tons) consumed was upward of 3 per cent greater than in the preceding year. This was largely due to the inferior quality and unsuitable character of much of the coal available in the abnormal circumstances. The strike was also largely responsible for an increase in the fuel-oil consumption from 38,810 tons to 145,911 tons. Since 1921 there has been an increase of 61.9 per cent in the generation of electricity, while sales show an increase of 57 per cent over 1922. The announcement of the government's policy with regard to the centralization of generation and the introduction of the electricity (supply) bill in March, 1926, had no noticeable influence in causing a deferment of application for consent to the establishment of new, or the extension of existing, generating stations. There was a big increase in generating plant sanctioned, the figure rising from 585,700 kw. to 775,604 kw., mainly for use in new stations. A remarkable increase in loans sanctioned for local authorities made up a record total of $76,907,170, which sum included $1,330,610 for wiring installations for consumers' premises and $674,075 for the purchase of domestic apparatus and appliances to be let out on hire.

The effect of present and prospective competition between the rapidly growing beam wireless services and the submarine cables have excited considerable discussion following reports that the cable companies were seeking government assistance in bringing about a plan for co-operation between the rival means of communication. The difficulty of evolving such a plan is enhanced by the justifiable refusal of the radio interests to be associated with any scheme which would prevent the free development of the newer method. Meanwhile there is considerable activity in the cable world. In December the steamship *Colonia* left the Thames to lay two new cables for the Eastern Telegraph Company between Alexandria and Port Said. The scheme of which this forms a part will enable regenerative working to be carried on between London and India and places further east. Another cable is being laid between Larnaca, Cyprus, and Haifa, Palestine, and work is progressing on the new Le Havre-Newfoundland cable. The first section going direct to Newfoundland will be 2,500 miles long, and a further section of 1,250 miles is to be laid between Newfoundland and New York.

Industrial developments of the month include the first commercial application in Sheffield steel works of a high-frequency induction furnace for the manufacture of high-grade tool steel and the introduction by the British Thomson-Houston Company of a new design of 110,000-volt potential transformer, in which size and weight are reduced very considerably. The General Electric Company has completed the electrical equipment of the *Bermuda*, a 20,000-ton luxury ship which will sail between New York and the Bermuda Islands. This vessel carries a more comprehensive electrical equipment than almost any other ship afloat.

Trade generally continues to improve, and exports of electrical goods during the eleven months to the end of November totaled $85,599,460, an increase of $3,242,975 over the corresponding period of 1926. The balance of exports over imports during that period was $59,292,765.

## Program Ready for Midwest Power Conference

Opening sessions of the third annual Midwest Power Conference, to be held at the Stevens Hotel, Chicago, begin on Tuesday morning, Feb. 14, when Sewell Avery, president of the Commercial Club of Chicago; Major Rufus Putnam and Glenn Frank, president of the University of Wisconsin, will make addresses, Mr. Frank taking as his subject "Power, the Background of Today's Civilization." Under the head of "Power Accomplishments in Factory and Home," the afternoon session will hear W. A. Durgin, Commonwealth Edison Company; Mrs. J. D. Sherman, president of the General Federation of Women's Clubs, and Burke Corcoran, Electrical Association of Chicago.

The two sessions on Wednesday have been given over to the general subject of "The Relation of Power Development to Flood Control and Other River Problems." General Edgar Jadwin, Major G. E. Edgerton, D. W. Mead of Madison, Wis.; Colonel William Kelly, Major L. H. Watkins, E. A. Forward of Montreal, and H. A. Hagemann of Stone & Webster will speak.

Thursday morning's session will be devoted to the general subject of "Economics of Power Stations." Alex Dow, president Detroit Edison Company, will open the discussion, his topic being "Capital Costs with Relation to Economy of Central Stations." G. A. Orrok, New York City, will talk on "High-Pressure Operation" and Thomas E. Murray, New York, on "Trend and Development in Steam Generation." A luncheon symposium will follow, at which H. B. Gear, Commonwealth Edison Company, will speak on "Power Transmission by High-Voltage Cables"; H. W. Eales, H. M. Byllesby & Company, on "Overhead Transmission"; A. C. Montieth, Westinghouse Electric & Manufacturing Company, on "Developments in Apparatus for Power Transmission Systems," and W. S. Clark, General Electric Company, on "Causes of Failure in Impregnated Paper-Insulated, Lead-Sheathed Cables."

"Economics of Power Station Problems" will be the topic for the Friday morning session, with the following speakers: T. A. Peebles of the Hagan Corporation, J. F. Shadgen of the Smoot Engineering Company, Edward Brown of the Allis-Chalmers company, and S. W. Parr and F. C. Straub of the University of Illinois.

## Fall River Electric Service Survives Great Fire

Electric light and power service came little impaired through a conflagration involving the loss of many millions of dollars at Fall River, Mass., on Thursday night of last week, when the center of the city was swept by one of the worst fires in its history and more than a hundred business buildings were destroyed. To a representative of the ELECTRICAL WORLD President Roy F. Whitney of the Fall River Electric Light Company stated on Friday that virtually all the circuits supplying the retail business district are of the underground type and that the company was fortunate enough to escape with a comparatively small loss, confined largely to meters, services and switching equipment in stores, banks and hotels. Many manholes were flooded, but transformers installed underground had given little or no trouble up to Friday afternoon. No residences were destroyed, and service was maintained throughout the fire to all parts of the territory except where falling walls destroyed street lamps or where it was necessary to open service switches in buildings as the fire attacked them. All employees escaped injury.

STREET LAMPS BURNED UNTIL THE WALLS FELL

The company's main offices were evacuated Thursday evening, and all important records were transferred in about an hour by motor truck to the Montaup generating station on the Somerset side of Mount Hope Bay. These were returned on Friday. No active mill load was lost, and the company was prepared on Friday evening to serve any customer desiring service in the burned area. Generating and substations escaped damage. The Western Union and Postal Telegraph offices were burned out and the local exchange of the New England Telephone Company was evacuated from 11 p.m. to 7 a.m., owing to the destruction of adjacent buildings.

## A.I.E.E. at New York and St. Louis

*Everything in Readiness for Winter Convention Next Week—Program of Regional Meeting in the Missouri City in Early March*

PROMISED demonstrations of transatlantic telephony by exchange of greetings with the Institution of Electrical Engineers, the British body which will meet in London simultaneously with the winter convention of the American Institute of Electrical Engineers in New York; lectures by Dr. W. F. G. Swann of the Bartol Research Foundation of the Franklin Institute and Dr. Harold Norinda of Sweden; presentation of the John Fritz medal to John J. Carty and the Edison medal to Dr. W. D. Coolidge, in addition to the excellent technical program and the customary entertainment features and inspection trips, have attracted interest even greater than usual to the A.I.E.E. gathering just referred to, which will be held in the Engineering Societies Building next week from Monday to Friday. A full notice and program of this event were printed on page 167 of the Jan. 21 ELECTRICAL WORLD.

For the regional meeting to be held by the Southwestern District at St. Louis on March 7-9 in the Hotel Coronado four technical sessions will take up respectively electrical machinery, power systems (two sessions) and communication, four papers being allotted to each session, as follows:

### WEDNESDAY, MARCH 7

*Morning.*—Branch conference and students' technical session.

*Afternoon.*—Addresses by Vice-president A. E. Bettis and President Bancroft Gherardi; Electrical Machinery; "Magnetic Leakage and Fringing-Flux Calculations," W. L. Upson and E. L. Furth, Washington University; "Squirrel-Cage Motors with Split Rings," H. Weichsel, Wagner Electric Corporation; "Electric Equipment for Oil and Gas Locomotives," A. H. Candee, Westinghouse Electric & Manufacturing Company; "The Squirrel-Cage Motor," J. L. Hamilton, Century Electric Company.

*Evening.*—Lecture, "Lightning," F. W. Peek, Jr., General Electric Company; entertainment.

### THURSDAY, MARCH 8

*Morning.*—Power Systems ("A"): "The Public Utility Laboratory and Its Relation to Service." G. E. Meredith and D. D. Clark, Kansas City Power & Light Company; "Recent Developments in the Application of Demand-Metering Equipment," Stanley Stokes and Leslie V. Nelson, Union Electric Light & Power Company; "Excitation Systems—Their Influence on Short-Circuit and Maximum Power," R. E. Doherty, General Electric; "Voltage Regulators," R. M. Carothers and C. A. Nickle, General Electric.

*Afternoon.*—Inspection trips.

*Evening.*—Dinner-dance.

### FRIDAY, MARCH 9

*Morning.*—Power Systems ("B"): "Development of Impedance Relays," H. A. McLaughlin and E. O. Erickson, Westinghouse; "Automatic Switching of Incoming Lines and Transformers Supplying Power to Alternating-Current Substations," E. A. Anderson, General Electric; "Quantitative Mechanical Analysis for Power-System Transient Disturbances," R. C. Bergvall and P. H. Robinson, Westinghouse; "Vibration of Transmission-Line Conductors," Theodore Varney, Aluminum Company of America.

*Afternoon.*—Communication: "Vector Calculating Devices," M. P. Weinbach, University of Missouri; "Planning Telephone Exchange Plants," W. B. Stephenson, Southwestern Bell Telephone Company;

"Tuned Radio-Frequency Amplifiers," Prof. R. S. Glasgow, Washington University; lecture, "Television," H. E. Ives, Bell Telephone Laboratories.

## Power Situation in Canada as Year Begins

*Premier of Quebec and Dominion Minister of the Interior Summarize Progress — Saskatchewan's First High-Tension Line—English River Development*

PREMIER TASCHEREAU of Quebec in a New Year message recently made a summary of the progress of electrical power in that province in which he spoke of the 450,000 hp. already installed at Ile Maligne, which will in the near future reach 540,000 hp.; of the 368,000 hp. now within sight, eventually to reach 572,000 hp., at the three Gatineau River developments, and of other water-power plants now operating or under way.

Charles Stewart, Canadian Minister of the Interior, in announcing an increase of 221,000 hp. in the whole Dominion in 1927, bringing the total installation to nearly 4,800,000 hp., to which 378,000 hp. will be added in the next six months and 2,000,000 hp. in the next three years, refers specially to the contemplated 800,000-hp. development of the Alcoa Power Company at Chute à Caron, on the Saguenay, mentioning also the 65,000-hp. plant built by the Montreal Island Power Company on the Rivière des Prairies, the addition of two 10,000-hp. units to the Canada Northern Power Company's plant on the Quinze River, to be ready July 28, and the addition of unit No. 11 of 45,000 hp. to the Duke-Price development on the Saguenay River.

Among the larger Ontario achievements were construction at Alexander Landing of a 54,000-hp. plant to serve Port Arthur and Fort William, the 56,250-hp. plant of the Spruce Falls Company on the Mattagami River, and the International Nickel Company's 28,200-hp. plant on the Spanish River. Actual installation during the year included two plants at Sturgeon Falls and Moose Lake in western Ontario

In New Brunswick the St. John Power Company continued its development of 80,000 hp. at Grand Falls, and the New Brunswick Electric Power Commission extended the transmission lines in its Musquash development to the extent of 65 miles.

It is reported that the Bathurst Pulp & Paper Company is planning for the erection of a 50,000-hp. hydro-electric plant on the Nepisiquit River, with which will be coupled the erection of a new 200-ton newsprint mill. The Power Corporation of Canada is to make a study of the company's power holdings.

In Nova Scotia the Nova Scotia Power Commission completed the construction of the 5,000-hp. Sandy Lake development on St. Margaret's Bay.

The Manitoba Power Company completed the superstructure of its Great Falls plant on the Winnipeg River. News also comes that a tentative agreement, subject to the approval of the three governments interested, has been reached by representatives of the Dominion, Ontario and Manitoba with respect to the proposal to build the Lac Seul Dam in order to make possible a power development on the English River. The agreement will provide for the joint erection of a dam by the Dominion and Ontario upon a cost basis proportionate to the power benefits derived. Engineering surveys have indicated that two-fifths of the power possibilities of the English River, or some 212,000 hp., lie on the Ontario side, while the rest lies in Manitoba. No development has as yet been undertaken on the Ontario section of the river, but work has been done in Manitoba.

George Spence, Minister of Railways in the Province of Saskatchewan, recently lifted the lever that energized the first important high-tension line in that province and sent electrical energy from the city of Regina to a number of nearby towns and villages. The transmission line is 32 miles long with a voltage rating of 13,200. It was so constructed as to be able to stand up under 66,000 volts to provide for future development. Next spring two new lines will be built, one north and one south from Qu'Appelle, and officials are hopeful of having at least 175 miles of lines carrying electrical energy to points in the eastern section of Saskatchewan.

Active consolidations of small light and power companies all over the Canadian Western provinces marked the close of 1927. Interest centers in the new plan of locating large central-power plants in those sections of the prairies where the cheap varieties of soft coal are present in quantities. In Saskatchewan and Alberta coal fields five such central plants are either in operation or under construction. Most of these consolidations have been promoted by the International Utilities Corporation, operating under the Midwest Utilities Company, of which C. J. Yorath of Edmonton, Alberta, is president. The latest acquisition of this combination is the Union Power Company of the Drumheller Valley, in southern Alberta.

In British Columbia the Bridge River Power Company carried on extensive preparatory work in connection with a 500,000-hp. project.

## Operators' Convention Draws Crowd

### Cedar Rapids Meeting of Iowa Section, N.E.L.A., Demonstrates Interest in Commercial and Distribution Problems Which Arise Daily and Affect Public Relations

PROBLEMS encountered in the sale of energy and merchandise and in the distribution of energy occupied the attention of the Iowa Section of the National Electric Light Association at its annual meeting, held at Cedar Rapids on Feb. 2 and 3. This convention, the second in which the Iowa Section has tried the experiment of confining interest to sales and operating matters, demonstrated again the wisdom of the idea. It proved a successful attempt to bring the commercial and distribution men of the state together. Three hundred and fifty men were registered and each one was ready not only to absorb the information offered to him but to discuss and criticise it because it was concerned directly with the problems he ran into daily.

The first session of the convention was general and was presided over by Ray Ingham, chairman of the convention committee. Addresses by C. O. Loftus, Mayor of Cedar Rapids; George A. Neal of the Iowa Light, Heat & Power Company, S. C. Dows of the Iowa Railway & Light Corporation, Don M. Stearns of the Central Iowa Power & Light Company, C. A. Leland of the Des Moines Electric Light Company and Thorne Brown, managing director of the Middle West Division, N.E.L.A., brought home to the auditors the magnitude of their industry, the local effects and causes in the national picture and the never-decreasing importance of good public relations. In a keynote speech by C. A. Leland the indissoluble link between commercial effort and advances in the electrical art was exposed. Improvements in operating practice and equipment are vain if the energy is not sold, Mr. Leland insisted, and selling effort is pointless unless the energy can be delivered more and more cheaply.

Domestic lighting, methods for raising illumination levels, refixturing and lamp sales were features of the first meeting of the commercial men. Progress in artificial lighting in the home was described by E. W. Commery, and selling industrial and commercial lighting was discussed by L. V. James, both of the National Lamp Works. Methods of refixturing in cities and in small towns were discussed by E. J. Otterbein of the People's Light Company and A. C. Jones of the Iowa Public Service Company respectively. These papers drove home the thought that refixturing was a worth-while but difficult job and that results are achieved only by continuous application over long periods. The stimulation of lamp sales by employee campaigns and direct-by-mail selling was illustrated by the results of such efforts as presented by Ira Steele of the Des Moines Electric Light Company and H. D. McKeever of the People's Gas & Electric Company.

On the second day, with C. A. Nash in the chair, there was round-table discussion on electric refrigeration sales methods. A point brought out and generally agreed upon was that there is a distinct trend away from remote to self-contained units in domestic demand. Changes in methods of selling, based upon an easier public acceptance of the idea of electric refrigeration, were discussed. William Dannehauer of the Edison Electric Appliance Company explained range-selling practices that have been successfully used. The nature and the sales possibilities of electrical equipment for the farm and farm home were treated in an admirable paper by Frank D. Paine, professor of electrical engineering at Ames College. Mr. Paine presented the equipments in the order of their preference by the farmers and gave the load characteristics of each from actual use and test. The utilization of sales helps furnished by manufacturers and the tangible results secured therefrom were the subject of a talk by A. W. Grove of the Edison Electric Appliance Company. A. W. Gucker of the Iowa Public Service Company presented a capable analysis of merchandise sales organizations covering compensation, bonuses, prizes and quotas. The commercial meetings were closed with a general discussion on the sales and use of laundry equipment.

The sessions of the distribution men, parallel with those of the commercial men, were devoted to explanations of practices and methods applicable to daily operation. The distribution line best suited to farm service was the subject of a paper by E. M. Ruede of the Citizens' Gas & Electric Company. Concrete example was furnished by a completely equipped pole top set up in the room. J. M. Drabelle of the Iowa Railway & Light Corporation gave, out of his long experience, an excellent address on the handling and installation of transformers and transformer protective equipment. Operation and regulation of transmission lines were covered by E. A. Wisco of the Interstate Power Company. H. H. Carl of the Northwestern Bell Telephone Company presented a detailed analysis of the general problem of inductive co-ordination. Accident prevention in electric utilities was the subject of a fine paper by K. R. MacKinnon of the Nebraska Power Company. Mr. MacKinnon suggested the setting up of a "bogey" at which the work of accident prevention in individual companies could be aimed.

Radio problems affecting electric utilities were covered in two papers, one by F. E. St. Austell, president of the Iowa Radio Listeners' League, on the aims and possibilities of the league, and the other by J. O. Smith, Radio Corporation of America, on common causes of radio interference. Foss C. Hush of the Iowa-Nebraska Light & Power Company talked on equipment and problems of the meter department.

The use by distribution men of Bulletin No. 10 of the National Electrical Safety Code and of the "Overhead Systems Reference Book" was discussed and explained by A. B. Campbell of N.E.L.A. headquarters. A. O. Austin of the Ohio Brass Company described recent tests and results obtained in high-voltage investigations of distribution and transmission line material. The meetings of the distribution men were closed with a symposium on high-voltage live-line maintenance.

## Briefer News

Kansas Gas & Electric Company to Expend $3,000,000 on Extensions and Improvements.—Approval of a general expansion and improvement plan entailing the expenditure of $3,000,000 was granted by stockholders of the Kansas Gas & Electric Company at a meeting held in Wichita last week, according to L. O. Ripley, vice-president of the company. Details of the program have not yet been made.

Broadway Has Sign Consuming 283 Kw.—An electric advertisement of the Dodge automobile — the most brilliant and largest in structural dimensions on Broadway, New York, according to the General Outdoor Advertising Company—was illuminated last week at a dinner of the Broadway Association. The sign, on the roof of the Strand Theatre building, has 5,500 sq.ft. of space, is half a block long, five stories high, and its 8,115 lamps represent a load of 282,855 watts, which is asserted to be the largest consumption by any electrical sign on the "Great White Way." Twenty miles of wire are utilized in the sign, which embodies new principles of illuminating reflectors and construction of the moving message, or motograph, in operation at the foot of the structure.

Emergency Connection for Aurora, Ill.—The Western United Gas & Electric Company is planning connection of its Aurora (Ill.) power house with a 134-kv. line of the Public Service Company of Illinois, according to Fred Pierce, superintendent, and right-of-way between Waukegan and Joliet is being obtained. The emergency line will connect with the Waukegan line at Electric Junction.

First Unit at Avon Park, Fla., Is Ready.—The first 15,000-kw. unit of the Florida Public Service Company's steam-electric generating station at Avon Park has been completed. The new plant, which is similar to that at Benson Springs, Fla., placed in operation about a year ago, is interconnected with the other steam stations of the system and with those of other operating companies, thereby insuring uniform and continuous service throughout the Florida territory of the General Gas & Electric Company, the parent concern.

United Newsprint Companies in Canada Own 500,000 Potential Hydro Horsepower.—The recent Abitibi-Spanish River and associated newsprint companies merger in Canada places the new company in the category of a large holder of water-power sites. The total installed capacity of its water powers is 190,000 hp., but undeveloped water sites indicate a total capacity of 500,000 hp.

Good-Will Convention Drew Many to Okmulgee.—The first of a series of good-will conventions to be held in various sections of Oklahoma by the Public Relations Division of the Oklahoma Utilities Association was held in Okmulgee on Feb. 1. About 75 representatives of utility companies and municipal water departments attended the business sessions, and 250 citizens and public officials the evening banquet, with Mayor Dan Kenan of Okmulgee as toastmaster.

New Orleans' Coming Electrical Show.—Exhibits at the state-wide electrical exposition to be given at the Delgado Trades School in New Orleans during the week of March 5-10 under the auspices of the Electrical League of New Orleans, with W. E. Clement, general manager commercial department New Orleans Public Service, Inc., as chairman, will include a complete miniature model farm and a model airport. A large proportion of the floor space has already been assigned.

St. Louis Going Ahead with Its Street Lighting Program. — Mayor Miller of St. Louis has signed a measure which authorizes the expenditure of $2,250,000 for a downtown lighting system, which it is hoped to complete by next December. After this appropriation shall have been spent there will be only $859,000 left of the $8,000,000 voted by the people, with a large portion of the city still to illuminate. It is estimated that $3,000,000 or $4,000,000 will be needed to complete city-wide lighting, there being still 11,000 gas lights on St. Louis streets.

Tentative Agreement on Texas-Colorado River Development.—If the tentative agreement between the Syndicate Power Company of Dallas and the representatives of the water district of Brownwood, Tex., is carried out, the number of acre-feet of water of the Colorado River which the State Board of Water Engineers will grant the former company for its proposed hydro-electric plants will be reduced from 1,280,000 to 580,000, or less than half. It is asserted that this relinquishment will enable the company to fulfill its power plans and at the same time will satisfy the water requirements not only of Brownwood but also of San Angelo.

Ellensburg, Wash., Cancels Contract with Puget Sound Power & Light.—The city of Ellensburg, Wash., which less than two years ago made a ten-year contract with the Puget Sound Power & Light Company for all energy needed in excess of the output of the municipal plant, has abrogated the contract, which it declares invalid, and refuses, it is said, to pay for energy supplied by the company in the last three months of 1927. A lawsuit will result.

Anderson, Ind., Refuses to Allow Private Emergency Line to Delco-Remy Plant.—By a vote of three to two, the City Council of Anderson, Ind., has rejected a proposal by the Delco-Remy Corporation and the Indiana General Service Company of Muncie for an emergency electric power line to the Delco-Remy plant, employing more than 7,000 and now supplied by the municipal light plant. The Mayor of the city favored the proposition and protested against the action taken.

Carrying Electricity to Remote Spots on the Rio Grande.—Several Texas border settlements in a remote region of the Rio Grande, 60 to 100 miles from a railroad, will, it is reported, soon be supplied with electric light and power by the plant of the Presidio (Tex.) Light & Power Company. Under the terms of a concession granted the company by the Mexican government a power transmission line will also be built from the plant to Ojinaga, Mexico, and other towns on that side of the river. Irrigation pumping plants on both sides of the Rio Grande will obtain power from the wooden-pole transmission lines to be constructed.

Hydro-Electric Plant Near Port Angeles, Wash., Planned. — The Northwestern Power & Light Company, Port Angeles, Wash., seeks an appropriation of 1,200 sec.-ft. of water from the Elwha River, in the Olympic peninsula. Plans filed with the state authorities put the output at 22,000 hp., which would be used for manufacturing. The plant would be built approximately 7 miles southwest of Port Angeles. Rights are also asked for the Rica Canyon Reservoir, which would store approximately 65,000 acre-feet of water. A total fall of about 300 ft. would be utilized for the Elwha River development, which would cost in all about $2,200,000.

Dern and Bannister Clash. — Testimony given by L. Ward Bannister of Denver before the House irrigation committee at Washington has aroused the ire of Governor Dern of Utah and others interested in the Colorado River situation. They charge that Mr. Bannister, a widely known water-power expert, whose testimony is supported by the Mayor of Denver, gave testimony in disagreement with the policy advocated by the upper basin states and favorable to Arizona's contentions. The dispute has waxed warm in Western newspapers, Mr. Bannister insisting that Governor Dern and not he departed from the policy adopted at the Denver conference and challenging him to debate the points at issue.

Coming Station Addition at San Diego.—The major expense item of the San Diego (Cal.) Consolidated Gas & Electric Company for 1928, according to Vice-president W. F. Raber, involves erection of an addition to the company's main generating plant at Kettner Street and Broadway. This 100-ft. x 140-ft. building will house the new 25,000-kw. generating unit already reported as in contemplation, together with auxiliaries and switching equipment, and will be of sufficient proportions to permit the installation of a second unit when needed. The first machine will probably be in operation by early fall. Actual erection of the building will start in two months.

## *Coming Meetings*

[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for Jan. 7, page 80.]

American Institute of Electrical Engineers — Winter convention, New York, Feb. 13-16; St. Louis regional meeting, March 7-9; Baltimore regional meeting, April 17-19. F. L. Hutchinson, 33 West 39th St., New York.

Midwest Power Conference — Hotel Stevens, Chicago, Feb. 14-17. G. E. Pfisterer, 53 West Jackson Blvd., Chicago.

Iowa Power Conference—University of Iowa, Iowa City, Feb. 15 and 16. Joe Carmichael, Iowa Committee on Public Utility Information, 310 Crocker Bldg., Des Moines.

Northwest Electric Light and Power Association — Commercial Section, Portland, Ore., Feb. 20 and 21; Engineering Section, Spokane, Wash., March 8 and 9. Berkeley Snow, 1208 Spalding Building, Portland, Ore.

New Mexico Utilities Association—Albuquerque, N. M., Feb. 20-22. Arthur Prager, Albuquerque Gas & Electric Company, Albuquerque.

New England Central Station Associaciation of Power Engineers—Engineers' Club, Boston, Feb. 29. T. D. Bond, C. H. Tenney & Co., Boston.

Oklahoma Utilities Association—Mayo Hotel, Tulsa, March 13-15. E. F. McKay, 1020 Petroleum Bldg., Oklahoma City.

Illinois State Electric Association—Hotel Abraham Lincoln, March 14-15. R. V. Prather, 205 Illinois Mine Workers' Bldg., Springfield, Ill.

National Electrical Manufacturers' Association—Policies Division, Edgewater Beach Hotel, Chicago, March 14-16. S. N. Clarkson, 420 Lexington Ave., New York.

International Association of Electrical Inspectors—Madison, Wis., March 17-18. W. Wilke, 4211 Elring Place, Milwaukee.

Maryland Utilities Association—Emerson Hotel, Baltimore, March 23. G. S. Williams, 1005 Continental Bldg., Baltimore.

Southwestern Division, N.E.L.A. — Edgewater Gulf Hotel, Biloxi, Miss., April 3-5. S. J. Ballinger, San Antonio Public Service Company, San Antonio, Tex.

Nebraska Section, N. E. L. A.—Omaha, April 4 and 5. T. E. Browne, 1527 Sharpe Bldg., Lincoln.

Dubuque, Iowa, Important Utility Headquarters.—Headquarters of the Central States Power & Light Corporation will be established in Dubuque, Iowa, about Feb. 20, according to H. C. Orton, president of the corporation and vice-president and general manager of the Interstate Power Company. The offices will occupy the second floor of the First National Bank Building. Dubuque is already headquarters of the Interstate Power Company, and the management of all the subsidiaries of both companies, serving 530 communities, will be directed from that city by Mr. Orton.

Gates at Oxford Dam Soon to Be Closed. — Work is progressing so rapidly on the Oxford Ford dam of the Duke Power Company on the Catawba River near Hickory, N. C., that it is estimated the finishing touches will be given and the gates closed by March 1. The Oxford Ford dam is of reinforced-concrete construction and is over 1,100 ft. wide and nearly 100 ft. high. The average thickness of the wall is 87 ft. In the power house two turbines of 35,000 kw. capacity each are being installed. To the left of the power house work is under way on the switching station. The lake formed by the impounding of the waters will extend for 22 miles, the headwaters reaching close to the Rhodiss dam. The lake will be used for boating, fishing and swimming.

Pacific Gas & Electric Has Comprehensive Sales Program.—Under the stimulus of the material reduction in residence lighting rates soon to become effective, the Pacific Gas & Electric Company has embarked upon the most ambitious sales program in its history. Expenditure of $633,000 in 1928 for sales and advertising expense and the employment of 183 salesmen are expected to sell a total of $1,187,000 worth of electrical merchandise, plus $398,000 for wiring and supplies, and add a load of approximately 115,000 kw. to the system. The program is predicated upon adherence to a well-established policy of loading existing facilities, continuance of the plan of co-operation with dealers and an inducement type of domestic rate soon to be filed.

Clarifying the Water Rights Law of Washington State.—In ruling that in order to hold previously issued water rights in Washington State the permit holder must have made some constructional development within ten years, B. B. Adams, Assistant Attorney General, has advised R. K. Tiffany, State Hydraulics Supervisor, that "actual constructional development" is not met by such activities as the carrying on of surveys, stream gaging, preparation of plans or purchase of rights-of-way. The ten-year period, Mr. Adams shows, is defined expressly by the Washington Water Code of 1917. The specific case responsible for the bringing up of this question arose from the recent application of the Great Northern Power Company for extensive water rights in Snohomish County which about ten years ago were filed on by Robert Howes of Seattle.

Bagnell Dam Project Revived in Missouri.—Applying to the Missouri Public Service Commission for continuance of the certificate issued a year ago by that body for the construction of a power dam across the Osage River near Bagnell, Mo., proposed by the Missouri Hydro-Electric Power Company, headed by Walter Cravens and R. W. Street, officials of that company say that work will begin "as early in the present year as flood conditions on the Osage will permit." The dam is to form a lake approximately 100 square miles in size. The organization and financial difficulties which interfered with the progress of this undertaking in 1926 were reported in the Electrical World.

Louisville Shifts to Electric Pumping for City's Water Supply.—Louisville's water supply is hereafter to be pumped from the Ohio River by hydro-electric power furnished by the Louisville Gas & Electric Company, Edward J. Miller, president of the Louisville Water Company, having signed a contract for this service last week. The contract runs for five years and will save the water company an estimated $10,000 yearly, Mr. Miller announced. It calls for a yearly use of 11,000,000 kw.-hr. A new pump, costing with motors of 2,500 hp. $75,000, will operate for eighteen hours each day, throwing 60,000,000 gal. of water into the reservoirs. It is expected to have the equipment delivered and installed within three months. At present a steam plant operates four pumps. These will be kept for reserve use.

International Board of Engineers for St. Lawrence Development Asked.—The report of the International Joint Commission that investigated the St. Lawrence waterway project would be accepted by Congress under a resolution presented by Representative Mapes of Michigan. To put the recommendations in this report into effect, it is proposed to create an International Board of Engineers who would work out detailed plans for the construction and operation of the waterway. Attention would also be paid to ascertaining the maximum efficiency of water power from such a waterway. It is further recommended that this waterway be not less than 30 ft. deep. An appropriation of $100,000 is recommended to defray the expenses of the International Board of Engineers. The expenses of the Canadian section would be paid, of course, by its own government.

## Recent Court Decisions

Requiring Approval of Commission for Utility to Enter Community No Violation of Constitutional Rights.—No violation of the constitutional rights of the Kansas Gas & Electric Company was involved, according to the Supreme Court of Kansas, in barring it from territory it desired to serve by action of the Public Service Commission of the state (against which the company brought suit), since it is within the statutory power of the commission to determine whether permission to a second utility to enter occupied territory would be a needless economic waste, to substitute regulation for competition, or to exclude the applying utility entirely. (261 Pac. 592.)*

No Cause of Action Shown Where Child Was Killed by Climbing on Tank and Accidentally Touching Wire.—The Court of Appeals of Georgia supported the trial court in Mobley vs. City of Monroe in dismissing the suit on the ground that no cause of action was shown. The plaintiff sought damages for the death of her eleven-year-old son, who climbed on a water tank belonging to a cotton mill and came in contact with a live wire belonging to the city and strung at a distance of two feet from the leg of the tank, the boy falling to the ground and being killed. It was held by the plaintiff that the tank constituted an "attractive nuisance" to children and that both the city and the owner of the tank were grossly negligent in permitting the proximity of the wire, but the court sustained demurrers. (140 S.E. 516).

Constitutionality of Law Making It a Crime to Tap Corporation-Owned Wires.—The Vermont Supreme Court has found, in State vs. Shady, that a criminal statute of the state prohibiting the tapping of wires and using the electric current therefrom without the consent of the corporation owning the same was not unconstitutional because it did not make it a crime so to use the current from a line owned by an individual, partnership or association. "The power of classification for such legislative purpose will be reviewed," the court said, "only when exercised in a palpably arbitrary manner. It is established by the decisions that a criminal statute enacted for the protection of a particular class is not unconstitutional simply because the specified class is not all-inclusive, or might have been so enlarged as to include others equally meriting the same protection." (138 At. 777.)

Court Order to Utility to Pay Attorney Fees as Condition of Dismissal of "Ad Quod Damnum" Proceedings an Error.—A power company that has initiated *ad quod damnum* proceedings in connection with acquiring a site for a hydro-electric development may, under a decision of the Nebraska Supreme Court, dismiss the action any time before submission without incurring any other penalty than that of paying the usual court costs. The court held that the District Court of Saline County went beyond its power when it gave its consent to the motion of the Blue River Power Company to dismiss such proceedings on the condition that it also pay $1,000 attorney fees for the defendant land owners. The Supreme Court held that *ad quod damnum* proceedings do not differ in any essential from ordinary actions at law, which the statutes say may be dismissed by the plaintiff on the payment of costs. It holds that the case falls within the judicial classification of losses for which there is no legal remedy, and that as the defendants had lost no substantial rights, since they still have claims for damages and may initiate proceedings themselves, it was an error to require payment of their attorney fees.

## Commission Rulings

North Dakota Commission Law Construed.—Negotiations for the construction of a public utility plant and the attainment of a franchise to operate it prior to the effective date of a regulatory act were held by the North Dakota Board of Railroad Commissioners not to constitute actual construction where there was no evidence of binding contracts made with reference to the construction prior to such date, and it was, therefore, held, in a complaint ticketed as Minor vs. Erickson, that the company involved must procure a certificate from the commission. The commission also held that a statutory provision requiring a certificate from the commission before the construction or operation of a utility plant was not an unlawful invasion of the rights of a municipality under a constitutional provision prohibiting legislation allowing the construction or operation of various utilities within a city, incorporated town or village without its consent.

Wisconsin Commission Bows to Supreme Court Ruling.—An order of the Wisconsin Railroad Commission increasing telephone rates of the Wisconsin Telephone Company at its Green Bay exchange has been modified at a rehearing to comply with the opinion of the Wisconsin Supreme Court as to present value. The commission, reaffirming its views as to prudent investment being the most important element in valuation, said that the Supreme Court had recently stated in substance that it was doubtful whether any valuation not substantially based upon present-day prices would meet the rule of valuation laid down in decisions of the United States Supreme Court. It therefore observed: "As the commission is an administrative body charged with carrying out the provisions of the law and is bound by the authoritative interpretations of the state and national supreme courts, there can be no question that the rate base used in our previous order, which was the book value, must be modified to conform to the law as stated in the Indianapolis Water Company and the Waukesha Gas & Electric Company cases. At the time of the previous decision the commission made no effort to determine the depreciated value of the property as the matter was not material in that case, where the original cost was accepted as the rate base and the allowance for depreciation was computed under the sinking-fund method. With the recent rulings of the Supreme Court, however, it now becomes necessary that we determine the extent of the depreciation in the property, as the depreciated reproduction value on a present-price basis must be given material weight in fixing the fair value of the property."

# News About Men of the Industry

## Five Westinghouse Staff Men Are Promoted

W. J. Longmore, a member of the executive staff of the manufacturing department of the Westinghouse Electric & Manufacturing Company, has been transferred from the office of general purchasing agent to consulting supervisor of purchases; E. R. Norris from director of works equipment to general works manager of all manufacturing operations, A. W. Bass from director of works records and statistics to assistant to the vice-president, S. E. Marks from director of traffic and shipping to director of traffic, and C. G. Taylor from director of purchases to general purchasing agent. These five promotions have just been announced by Vice-president H. P. Davis.

Mr. Longmore, a veteran of the company, being perhaps the oldest in continuous service, entered the employ of the Westinghouse interests in 1881 as a laborer and has worked his way steadily up. Mr. Norris began his connection with the company in 1892 as a general machinist, subsequently being made assistant works manager. Mr. Bass' employment with Westinghouse was the direct result of his writing an article concerning a new method of analysis for long reports. Mr. Marks entered the employ of the company in 1891 in the purchasing department and in 1906 received charge of the shipping department. Mr. Taylor's employment dates from 1887. He became purchasing agent in 1917 and later director of purchases.

---

W. S. Wyman, president of the Central Maine Power Company, has been elected president of the Edwards Manufacturing Company of Augusta.

John E. Davis, manager of the public information department of the Kentucky Utilities Company for the past three years, has been appointed director of public relations for that company.

N. E. Drexler has been appointed acting manager of the Newport News & Hampton (Va.) Railway, Gas & Electric Company, recently acquired by the Insull interests. He succeeds C. D. Porter, formerly general manager. Prior to his promotion Mr. Drexler was manager of the gas and electric light department.

H. B. Heryford, division manager of the West Side division of the Pacific Gas & Electric Company, with headquarters at Red Bluff, Calif., has been appointed division manager of the San Joaquin division to succeed the late Charles S. Northcutt. The West Side division of the company is to be abolished, part of the territory being placed under G. R. Milford, manager of the Shasta division, and part under I. B. Adams, manager of the Desable division. Mr. Heryford has been connected with the electric and gas industries of California for the past 25 years, and his promotion now places him in charge of one of the largest and most important divisions of Pacific Gas & Electric.

George J. Klein of Cleveland was elected president of the Artistic Lighting Equipment Association at its recent meeting in that city, and C. A. Bridges of Milwaukee was elected vice-president.

R. M. Watt, manager of the Mountain district operations of the Kentucky Utilities Company, with headquarters at Pineville, Ky., has recently been elected a director of the company.

Dr. Alfred N. Goldsmith, chief broadcast engineer of the Radio Corporation of America, was elected president of the Institute of Radio Engineers at its recent annual convention. He was formerly its secretary.

William Whitney, formerly assistant superintendent of gas manufacture of the Rochester (N. Y.) Gas & Electric Corporation, has recently been appointed assistant chief engineer.

Joseph K. Choate will resign as a director and vice-president of the J. G. White Management Corporation on March 31. He has had a prominent rank among civil and railroad engineers for many years and has been president or vice-president of various railroad and utility companies, including the Manila Electric Company. Mr. Choate was born in Salem, Mass., in 1853 and was educated at the University of Colorado.

F. D. Mahoney has tendered his resignation as vice-president of the West Penn Power Company, to take effect March 1. He will then take a position with the Electric Bond & Share Company, with headquarters in New York, and will be engaged in the expansion of that company's interests in foreign countries.

## Obituary

Selyron Nivision Blake, a native of Elmira, N. Y., died suddenly at his home in Brookline, Mass., Feb. 3. The major part of his life he was engaged in the ownership and operation of electric and gas utilities.

Ludwig Gutmann, retired inventor and writer of textbooks on electrical engineering, died at St. Louis last week of heart disease. He was 67 years old. Mr. Gutmann was born in Hamburg, Germany, and came to America about 1890. He was formerly connected with the Wagner Electric Corporation.

William T. Gunnison, chairman of the New Hampshire Public Service Commission, died at his home at Rochester, N. H., on Feb. 2. He had been in ill health for several months. Mr. Gunnison, who was graduated from the Harvard Law School in 1895, was a law partner of former Governor Samuel D. Felker. He was born in Greenville, Mass., in 1869.

Bernhard Blitzer, president of the Lightolier Company, New York, died suddenly on Feb. 3 from a stroke of apoplexy. He was 62 years old. Coming to the United States from Austria in 1886, Mr. Blitzer is said to have landed with a capital of only 19 cents. He worked his way up from street peddling to business prominence. After entering the employ of a gas company he became interested in the opportunities for manufacture of lighting fixtures and put his savings into a small venture which grew until in 1916, when it was known as the New York Gas & Electric Appliance Company many years ago, died recently in tributed $15,000 as gifts among department heads and salesmen. Mr. Blitzer was a director of the Gramercy Finance Corporation and the New Jersey Discount Company. He was active in charitable work.

Jonas J. Joseph, organizer of the Shelbyville (Ind.) Electric Light Company, many years ago, died recently in Indianapolis, where he had lived for 22 years. He was born in Germany 80 years ago, coming to America at the age of thirteen.

Harry M. Haven, a member of the mechanical engineering firm of H. M. Haven & A. T. Hopkins, Inc., Boston, died at Winchester, Mass., Feb. 6. He was formerly a member of the firm of Haven & Crosby, Boston, and for some years was a member of the staff of Charles T. Main, Inc., of the same city.

Samuel J. Keese, pioneer southern California electrical engineer, died in Los Angeles on Jan. 20. He made one of the first arc lights seen in Pasadena and installed the lighting plant for the Mount Lowe railway. For a number of years he was a member of the firm of Rhodes & Keese, one of the first electrical supply houses on the Pacific coast. At the time of his death he was president of the Southern California Academy of Sciences.

## Seek to End Rate Disputes

### Massachusetts Bill Would Tie Up Companies in Rate Contract With the Commonwealth—Department Viewpoint Is Herewith Presented

IN AN effort to put an end to the numerous rate disputes which have arisen in Massachusetts, the Department of Public Utilities is sponsoring a bill designed to make permanent contracts with the companies whereby the latter agree to accept whatever decision is made by the commission with regard to rate changes, undertaking to refrain from appealing to the courts. The bill will come up for discussion about the middle of February.

In a report recently issued on the situation the Department of Public Utilities gave its reasons for presenting such a bill, as follows:

> Common experience demonstrates that when such cases go to the federal court several years usually elapse before the matter is finally determined, and in the meantime rates fixed by the department, as has already been done in the Worcester case, may be suspended. While it is true that if the United States Supreme Court in the respective cases should finally uphold the order of the department and the company would be compelled to return the excess charges to the customers, it is a fact commonly known that customers move away or many of them do not obtain or attempt to obtain the refund due them.
>
> The danger of the so-called United States Supreme Court's doctrine being enforced in this Commonwealth is so great that we think that we should at this time make preparations to avoid the results of such a doctrine. This doctrine promotes greed and gluttony on the part of the owners of public utilities. It asserts that the owners of the public utilities are entitled to retain and earn a profit upon excessive earnings which they may have exacted from the public. It asserts that the public has no real control over these utilities other than an ineffectual method of regulating rates, notwithstanding that the public gives to them exclusive rights in the highways and confers upon them the sovereign power to take private property by eminent domain. Moreover, it asserts that the property of the utility is increased in value by improvements in the public highways and that the owners of the utility are entitled to increased earnings by reason of these improvements and of the enhanced value upon its property resulting from the growth of the community. It also asserts that the owners of the utility are entitled to earnings upon the reproduction value of the property less depreciation, notwithstanding the service performed by it could be performed as well, if not better, by property that would cost much less.
>
> As a consequence, we feel that the time is now ripe to enact legislation by which the companies engaged in the sale of gas and electricity in this Commonwealth shall enter into a contract with the Commonwealth so that their rates may be speedily and effectually regulated with fairness both to the company and the public, and whereby the investor will be guaranteed that in no event shall rates be so regulated that he cannot sell his securities to obtain his original investment. We accordingly recommend the enactment of a bill to accomplish this result.
>
> Our proposed bill provides for a readjustment of the capital of any company which applies for such readjustment upon a basis which permits the capitalization of the premiums heretofore paid in and any earnings that have been plowed into the property at the expense of the stockholder who has not received on the average a return on his investment of 7 per cent, provided also that it shall not be capitalized beyond its fair value as determined by the department or beyond the amount expended for its property used and useful in the transaction of its business. The adjustment of its capital in accordance with the bill shall effect a contract with the Commonwealth by which the company agrees that it may be regulated by the Commonwealth in such manner as the Commonwealth may determine, so long as such regulation does not prevent it from paying

## No Lack of Confidence in These Stocks

A STUDY of the activities of the power and light stocks in the various markets discloses little fear on the part of investors that the Walsh investigation will bring out any information which could seriously affect the standing of the companies. No single group of stocks has forged ahead so consistently and steadily as power and light common during recent months, and especially during the first few weeks of the present year.

Among the more spectacular of the advances made in the first five months of 1928 is that of Montana Power common, which gained more than 60 points during January alone and now stands at around 160. The stock pays 5 per cent and the low for 1927 was 81. Brooklyn Edison is another stock that has shown a steady appreciation over a period, with an approximate gain of about 28 points in January alone. This stock has appreciated steadily from a low of 148 last year to a present quotation of around 236 and is now 14 per cent above the high point of 1927. A similar trend has been in evidence in the case of Middle West Utilities and Detroit Edison. The former opened the year at around 124 and has since risen to 134, or a gain of ten points during the month, indicating that the trend is shared by holding company stocks and operating company stocks as well, more or less equally. Another stock that has shown a steady advance is Cleveland Electric Illuminating common, which appreciated from 330 at the beginning to 350 at the end of January. This is a 10 per cent stock. Laclede Gas Light Company, which pays 12 per cent on common, appreciated from 200 at the beginning of January to 240 at the end of the month, and Metropolitan Edison Company has shown a gain of more than 60 points during the same period. The Philadelphia Company during January rose from 140 to 163. One of the lower priced stocks, Puget Sound Power & Light Company common appreciated from 36 to 44 during January. One of the Pacific Coast companies, Washington Water Power Company, also showed a spectacular rise. The common stood at 167 at the beginning of January and 215 at the end.

While the following list of ten power and light common stocks comprises some of the most active in the market, they may be regarded also as fairly representative and are well distributed throughout the country. Following are bid prices at the beginning and end of January:

| | | |
|---|---|---|
| Montana Power | 104 | 161 |
| Brooklyn Edison | 207 | 235 |
| Middle West Utilities | 124 | 134 |
| Detroit Edison | 164 | 174 |
| Cleveland Electric Illuminating | 330 | 350 |
| Laclede Gas Light | 200 | 240 |
| Metropolitan Edison | 70 | 125 |
| Philadelphia Company | 140 | 163 |
| Puget Sound Power & Light | 36 | 44 |
| Washington Water Power & Electric | 167 | 215 |
| Average | 154 | 184 |

There is little lack of confidence on the part of investors in an industry the representative stocks of which have shown the trends indicated. Stocks which, as stated, may be regarded as more or less representative appreciated on the average 30 points during the month of January from an average of 154 to an average of 184, which is an increase of 20 per cent. What other industry can show a similar degree of confidence?

dividends upon its stock adequate to maintain such stock at par.

The bill also provides that as to those companies which do not take advantage of the bill the provisions of our statutes which require a municipality to purchase, if the company elects to sell, the latter's property located in the town before it can engage in the business of the sale of gas or electricity shall not apply.

In addition the bill provides that as to such companies as do not elect to come under its provisions, they shall not be given the power to take property by eminent domain and they shall not have the power to increase their capital stock and bonds beyond what they are at present.

---

MONTANA-DAKOTA COMPANY INCREASES CAPITAL. — The Montana-Dakota Power Company has increased its authorized preferred stock from $1,000,000 to $2,500,000, par $100.

FLORIDA COMPANY PAYS STOCK DIVIDEND. — Directors of the Tampa Electric Company have declared a semi-annual dividend of one-fiftieth of a share of common stock in addition to the regular quarterly cash dividend of 50 cents a share on the common stock, both payable Feb. 15 to holders of record Jan. 15.

## World Production of Electrical Energy

An estimate of the electrical energy production in various countries shows that while the United States is far in the lead for total output, with 44 per cent of the world's production, in output per capita this country ranks fourth.

ENERGY GENERATED IN VARIOUS COUNTRIES IN 1925

| Country | Kw.-Hr. Billions | Kw.-Hr. per Capita | Per Capita Rank |
|---|---|---|---|

* 1926.

The accompanying figures, except those for Canada, are for 1925. The estimate is based on data presented at the International Economic Conference at Geneva in May, 1927, having been compiled from the best available sources, and issued as a publication of the League of Nations. It may cause surprise to learn that only a few countries collect official statistics on energy production, and that the data are not strictly comparable because in some instances they relate to total output, in others to output of public utility plants only. To eliminate the disparity as far as possible, an estimate of total output for Canada in 1926, kindly furnished by the Dominion Bureau of Statistics, has been substituted for the original figures which applied only to public utility plants, and for the United States there has been added to the Geological Survey figures an estimated 12,060,000,000 kw.-hr. for energy generated in manufacturing and mining plants, giving a total of 77,930,000,000 kw.-hr. The correction advances this country from fifth place in production per capita and brings her ahead of Sweden. A few of the other items have also been slightly revised to incorporate more recent information. The figures are in general given only to

the nearest hundred million kilowatt-hours, as the accuracy of the original data seems scarcely to warrant any greater precision. In determining the energy output per capita, the population in 1925 has been used as nearly as it could be ascertained.

## Allis-Chalmers Net Profits Down 11 Per Cent

Net profits of the Allis-Chalmers Manufacturing Company for the last quarter of 1927 were lower than for any preceding quarter of 1927 or of 1926. This reduced net for the year by 11 per cent to $3,182,472. Bookings in 1927 aggregated $30,651,807, a decrease of 4.72 per cent from the 1926 total, while billings for the year were $33,352,252, a gain of 8.7 per cent.

## New Set-up Makes Possible Long-Term Financing

Plans for simplification of the capital structure of the Indiana Service Corporation, involving the retirement of about $4,800,000 in bonds, were announced today. As a part of the program, provision has been made for a new mortgage, and under it $5,000,000 first lien and refunding mortgage 5 per cent bonds, due Feb. 1, 1963, have been issued and sold to Halsey, Stuart & Company.

Changes being made will build a sounder capital structure for the company. The mortgage under which the first and refunding mortgage bonds were issued provided that they are all to mature not later than Jan. 1, 1950. Continuing under just this mortgage would limit the company to comparatively short-term financing as this date approached. The new mortgage makes it possible to finance on a long term basis.

The new capital structure will consist of the first and refunding bonds, which now become first mortgage bonds, totaling $7,566,500; the new series of $5,000,000 first lien and refunding 5 per cent bonds, and $145,000 non-callable underlying bonds, which are gradually being exchanged for an equal amount of first mortgage bonds which are on deposit with the trustee for this purpose.

The Indiana Service Corporation furnishes electric light and power in Fort Wayne, Ind., and 41 other communities in northeastern Indiana and is controlled by the Midland Utilities Company. The company also owns extensive electric railway properties.

## Cities Service Gross Up 30 Per Cent

An increase of 31 per cent brought Cities Service net earnings up to $31,952,951, which is the highest earnings figure on record for the company. Gross revenue rose 30 per cent, to $33,061,062, as a result of expanding business in virtually all branches.

As a result of this radical improvement in the company's earnings position the net revenue available for common stock and reserves amounted to $22,604,925, which is a 45 per cent rise over 1926. Preferred dividends were earned 4.32 times, against 3.52 times the previous year, leaving 27.34 per cent on the average amount of common stock outstanding, against 20.03 per cent in 1926. Net earnings of the company for the past five years were: 1923, $16,093,616; 1924, $16,773,744; 1925, $18,989,071; 1926, $24,462,662, and 1927, $31,952,951.

Last year's earnings show that the company has made very substantial progress. Net earnings for 1927 were equal to more than twelve times interest and discount on its debentures, as compared with 9.2 times for 1926. Net earnings to stock and reserves was 4.32 times preferred dividends, as against 3.52 times for the previous year. Net to common stock and reserves in 1927 was $22,604,925, or 27.34 per cent of the average amount of common stock outstanding, which is the equivalent of $5.46 per share of $20 par value of common stock. This compares with $15,611,466 for 1926, which was equivalent to 20.03 per cent, or $4 per share of common stock then outstanding.

## New Issues $48,968,000

The week's largest piece of financing in the power and light industry is an issue of $20,000,000 Pacific Gas & Electric Company first and refunding mortgage bonds bearing a 4½ per cent coupon. This is series E, due 1957, and brings the total amount outstanding to $120,000,000. The issue is sold at 99 and interest, which represents a yield of more than 4.56 per cent.

Another sizable issue is the $6,000,000 first refunding mortgage bonds of the Pennsylvania Water & Power Company, series B, also bearing a 4½ per cent coupon. This issue, which is sold at 99, to yield 4.55 per cent, is to retire two other issues, a 5½ and a 6 per cent issue.

The Indiana Service Corporation sold a $5,000,000 issue of first lien and refunding mortgage 5 per cent bonds at 99½ and interest. The proceeds are for capital expenditures already made and for additions and improvements.

The National Gas & Electric Corporation carried out two pieces of financing this week, selling a $3,400,000 issue of 5½ per cent first mortgage collateral bonds, series of 1928, and a short term issue, totaling $1,800,000, of 5½ per cent convertible gold notes maturing in 1931. Both issues are to help pay for the subsidiaries acquired by the National Gas & Electric Corporation and for other purposes.

A $2,750,000 issue of 6 per cent first lien collateral bonds, series A, was sold this week by the Western Power, Light & Telephone Company. The proceeds are to be used, presumably, in the acquisition of a group of subsidiaries in Missouri, Kansas and Oklahoma.

Another 4½ per cent issue just sold is the $10,018,000 first and refunding mortgage bonds, series D, of the Ohio Power Company, which retire the same amount of series C, 6 per cents.

## Reduces Capital Stock

The Eastern New York Utilities Corporation has filed a certificate in the office of the Secretary of State reducing its shares from 34,750 of preferred stock, $100 par value, and 25,000 of common stock, no par value, to 21,000 of preferred stock, $100 par value, and 13,750 of common stock, $100 par value.

## San Diego Company Plans Record Construction Program

New construction investments of the San Diego Consolidated Gas & Electric Company for the year 1928, as shown in tentative budget estimates, will exceed those of any previous year in the company's history, according to William M. Raber, vice-president and general manager. This company's plans are of especial interest in view of the restrictive program in force in many sections of the Pacific Coast.

In stressing the fact that the construction is greater than ever before Mr. Raber made the statement that anticipated increased demand for its product and steady territorial growth experienced in this section warrants the expansion. The major expense item of 1928 involves erection of an addition to the company's main generating plant, Station B. Alterations are also planned at the main office of the company in the Electric Building. Figures showing the actual expense of this year's construction have not yet been given out.

# Pennsylvania Water & Power Company Earns $3.49 on Common

An increase of 14 per cent in gross earnings and a 7 per cent growth in net income enabled the Pennsylvania Water & Power Company to report net earnings of $3.49 a share in 1927, against $3.26 in 1926. This is a favorable showing in view of the rise of 33 per cent which took place in combined operating expenses, taxes and maintenance. The total of these items last year was $1,272,816, against $956,721 in 1926.

Last year was undoubtedly the best year Pennsylvania Water & Power Company has had. As in 1926, the year 1927 showed a river flow well above the normal and, as a result, a substantial sum has been transferred directly to "contingent fund" without appearing in the gross revenue figure. The loads of the majority of customers have increased considerably.

The company's common stock, with a former par value of $100 a share, was converted last May to no-par stock on the basis of four new shares for each old. During the first two quarters of the year the dividend was at the rate of 2 per cent on the old $100 par, while for the last two quarters the rate was 62½ cents on each new share.

As will be noted from the earnings statement, a substantial depreciation reserve is set aside. Last year the amount was $243,143, against $230,053 in 1926. This is approximately 7 per cent of gross revenue. There was also distributed to contingent fund $200,000 in accordance with the company's policy of "building up this fund to an amount necessary to equalize such fluctuations in income as result from variations in river flow above and below the normal, in accordance with a careful study which has been made of observed river stages for a number of decades in the past."

It is evident from what has been said that this company is working into a very sound position. A loan of $6,000,000 in first mortgage 4½ per cent bonds is being incurred to simplify the capital structure, including the retirement of $3,000,000 of the company's 5½ per cent bonds of 1952 and $2,750,000 6 per cent bonds of the Holtwood Steam Power Company, which company was recently acquired. A substantial interest saving is evident. The new stock is currently quoted around $70, earns $3.49 (1927) and is now paying at the rate of $2.50 per share.

## Westinghouse Electric Earns $4.92 a Share

A continued gain is shown in the earnings of the Westinghouse Electric & Manufacturing Company for the last quarter of the year. The gain of $5,205,562 reported increased net profits for the nine months to $11,679,901, after expenses and federal taxes. These nine months profits were equal to $4.92 a share on the 2,370,063 shares outstanding. This figure combines the 7 per cent cumulative participating preferred as well as the common stock, which has a par value of $50 a share.

Contributing toward the increase in business were new orders received in the nine months period amounting to $127,878,766 and in the third quarter $40,939,380. Sales billed for the nine months aggregated $130,800,523, as against $146,887,186 for the corresponding nine months period of 1926.

# Business News and Market Conditions

## January Contracts Show Change in Type

*Commercial and Engineering Construction Declines — Condition Probably Temporary—Public Building Increases*

JANUARY construction contracts did not reach the high record of December. Private commercial building work has fallen off, though public building shows an increase. Contracts reported in January by *Engineering News-Record* total $197,984,000, or $49,500,000 per week, which is 35 per cent less than for the average December (the record) week, but 9 per cent more than the figure of January, 1927. Increases over December are in water-works (low last year), excavation, public buildings and federal government work. There was a definite drop in lettings for private commercial buildings and for that important engineering division, "unclassified"—which includes tunnels, subways, wharves, pipe and transmission lines, and power developments. Awards in New England were about the same as in December, but elsewhere there was a uniform decrease of more than 20 per cent.

The 5 per cent increase in value of water-works contracted for in January as compared with the preceding month was due to large awards in the Middle West, where the total was $1,159,000 in January and only $124,000 in December, 1927. In spite of a general decrease in industrial building the states west of the Mississippi and in the Far West showed increases of 12 and 63 per cent respectively. Commercial buildings were contracted for in larger volume in New England and in the South. New York state contributed $65,740,000, or about 43 per cent of the total private commercial building awards in December, 1927, and in January only $24,955,000, which was 32 per cent of the total.

Five classes of construction increased over January, 1927. These increases in percentages are: Bridges, 12; streets and roads, 10; federal government, 47; unclassified, 288; excavation, 493. The increase in excavation contracts is due less to unusual activity in current contract-letting than to subnormal conditions a year ago, when the total for the first month was only $603,000, the average month for the year being $3,500,000. January contracts in the unclassified division include the Michigan-Ontario international tunnel, $10,000,000, and several pipe lines in Texas totaling $10,000,000.

The sectional changes show increases over January, 1927, in all except the New England and Far Western states. The South increased 50 per cent; the Middle Atlantic, 41; west of Mississippi, 30; the Middle West less than 1 per cent. In the South the value of awards for commercial and public buildings in January, 1928, was 100 per cent greater than last year. Industrial buildings and unclassified showed the most appreciable increases in the Middle Atlantic group.

The construction volume index number for January is 208, which compares with 319 (the record) in December, an average of 228 for all of 1926, 262 for all of 1927 and 187 for January, 1927. The construction volume index refers to the actual volume of contract letting (not the mere money value of the contracts let).

## N.E.M.A. Appliance Division Organized

The appliance division of the National Electrical Manufacturers' Association was organized on Jan. 24. The heating appliance and the electric range and water heating sections are included in the new division. The first activities to be undertaken are the development of a market for electrical appliances in co-operation with other associations which have marketing problems in common and the establishment of sound merchandising policies.

## Orders for Electrical Goods

New orders booked during the fourth quarter of 1927, as reported to the Department of Commerce by 86 manufacturers of electrical goods, were $239,247,023, as compared with $235,557,857 for the third quarter of 1927 and $260,078,082 for the fourth quarter of 1926. The total orders booked for 1927 were $954,883,416, as compared with $1,011,870.102 for 1926. This indicates a decrease of about 5½ per cent in 1927. The accompanying table gives the totals of bookings for each quarter since the beginning of 1922. They are presented not as a complete statement of the industry but as probably sufficiently representative to indicate the trend.

ORDERS FOR ELECTRICAL GOODS

| Quarter | 1922 | 1923 | 1924 | 1925 | 1926 | 1927 |
|---|---|---|---|---|---|---|
| First | $143,320,453 | $225,399,383 | $228,760,838 | $233,023,182 | $262,677,736 | *$243,651,415 |
| Second | 165,370,750 | 240,542,824 | 221,167,876 | 227,502,652 | 248,000,075 | *236,427,121 |
| Third | 167,984,466 | 201,910,099 | 185,747,314 | 232,933,532 | 241,114,209 | *235,557,857 |
| Fourth | 192,473,402 | 218,165,415 | 231,470,552 | 244,597,050 | 260,078,082 | 239,247,023 |
| Total | $669,149,071 | $886,017,721 | $867,146,580 | $938,056,416 | $1,011,870,102 | $954,883,416 |

* Revised.

## Purpose and Development of National Electrical Code

The purpose and development of the National Electrical Code has been described in a booklet published by the National Electrical Manufacturers' Association, 420 Lexington Avenue, New York. In the foreword it is pointed out that the code is one of the fundamental documents of the electrical industry and is the product of an evolution which has progressed steadily for the last 35 years. The procedure for making "field" changes in the code also is covered and there is brought together for the first time a series of "route sheets" giving the successive steps in procedure for making both field and new material changes as well as important data about the Underwriters' Laboratories. A list of the N.E.M.A. committees whose efforts over a period of years have contributed to the strength and prestige of the code also is included.

VALUE OF CONTRACTS LET IN THE UNITED STATES AND CANADA DURING JANUARY, 1928

Totals for 1927 and 1926 (Thousands of dollars—000 omitted)

| | New England | Middle Atlantic | South | Middle West | West of Mississippi | Far West | United States | Total for January, 1927 | Canada |
|---|---|---|---|---|---|---|---|---|---|
| Waterworks | $60 | $328 | $150 | $1,159 | $187 | $263 | *$2,147* | $2,080 | $30 |

| New Zealand | 111,188 |
| British South Africa | 168,431 |
| Other countries | 321,768 |

# Market Conditions

DIVERSIFIED sales mark the trade in the New England district and small motor orders were active. Arc-welding equipment is selling well and street lighting is attracting attention. In the Eastern district central-station sales trend upward. Orders covering $750,000 worth of substation apparatus were placed by a New Jersey utility company. A 6,000-kw. turbine unit was purchased for McCamey, Tex. Large industrial motors were a feature of current commitments. Electric pumping machinery business looks promising.

An order for $135,000 worth of substation equipment was placed in the Southeast for a plant at Jacksonville, Fla., and $100,000 worth of power transformers was ordered by a company in the Carolinas. A steel mill in Alabama purchased $65,000 worth of motor equipment, and there is a satisfactory number of small industrial projects under way. In St. Louis business is normal. An order for 100,000 ft. of street-lighting cable was reported. The volume of sales continues on the same level in the Middle West, with a slight acceleration in some lines. On the Pacific Coast small motor sales are excellent, there is considerable activity in the Kern oil fields, and industrial buying is good and well distributed among various industries. The Great Northern Railway Company ordered about $250,000 worth of apparatus in connection with the Cascade Mountain electrification. The Northwest Power & Light Company plans a 22,000-hp. hydro-electric plant and the British Columbia Electric Railway Company plans four substations totaling $140,000.

## *Metal Sales Moderate at Slight Concessions*

Prices on the metal market are slightly easier than a week ago. The situation in copper and lead is practically unchanged since early in December. Copper sales were very satisfactory last week Wednesday, Thursday, and Friday, with the result that the producing group that has been holding for some time at 14⅛ cents delivered in the East and 14¼ cents in the Middle West were able to book several orders at those levels. A large buyer entered the market for prompt shipment, cleaning up all the spot copper in sight at varying prices up from 14.075 cents. The last-mentioned quotation has been made by one seller all week, and the

NEW YORK METAL MARKET PRICES

| | Feb. 1, 1928 Cents per Pound | Feb. 8, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic.... | 14⅛ | 14.075 |
| Lead, Am. S. & R. price | 6½ | 6¼ |
| Antimony............ | 11¼ | 11 |
| Nickel, ingot.......... | 35 | 35 |
| Zinc spots............ | 6 | 6 |
| Tin, Straits........... | 54½ | 53 |
| Aluminum, 99 per cent | 24.30 | 24.30 |

Base copper wire price Feb. 8, 1928, 15⅞ cents.

market in the last two days has settled down to that level, so far as actual business is concerned, the 14⅛-cent Valley quotations of the large producing interests being largely nominal for the time being. A comparatively small quantity of lead changed hands. It is significant that virtually every transaction was for prompt shipment and many of the orders were marked "immediate."

## *Central-Station Sales Trend Upward in Eastern District*

Central-station buying for early spring delivery has started in the Eastern district and there is marked activity in the market. Current inquiries are directed largely to substation equipment. A New Jersey central-station company has placed commitments in this line to an amount of $750,000, divided between two large manufacturers, and has also given orders for equipment for close to 300 gasoline-electric buses, aggregating $600,000. Ford, Bacon & Davis, Inc., New York, has contracted for generating and other machinery to be installed at the plant of the Pecos Valley Power & Light Company, McCamey, Tex., including a 6,000-kw. power unit. Transmission line equipment also gives promise in the early future and sizable orders are anticipated by several manufacturers. Inquiries for wire and cable for this service are improving. A leading manufacturer of marine-electric equipment states that very satisfactory business has been transacted in this line since the beginning of the year, with every indication of continuance for several weeks to come. The city of New York will soon be in the market for electric machinery for a fireboat and ferry-boat.

Industrial sales are good, with heavy type motors easily the feature of current commitments. A large manufacturer has secured a contract for motors and auxiliary equipment for a rock-crushing plant in the East totaling more than $200,000. Electric pumping machinery shows signs of developing sizable business within a few weeks. Camden, N. J., has plans for four such pumping plants with a gross capacity of 5,000,000 gal. daily, to cost close to $100,000, and Clayton, N. J., will soon be in the market for similar units for water service. A leading producer of electric clocks states that orders have been good since the first of the year. A survey of the Philadelphia district shows a better demand for substation apparatus and important commitments are looked for within a few weeks. Textile mills are more prominent in the market, as are some of the larger metal and iron concerns in the eastern Pennsylvania territory.

Immediate construction operations in the district include the following: The Public Service Electric & Gas Company, Newark, N. J., plans a substation on Monroe Street, Rahway, and probably a similar station at Princeton. The British-American Metals Company, Plainfield, N. J., will rebuild its plant recently destroyed by fire with loss of about $450,000. The Ossining Ice Company, Ossining, N. Y., will proceed with an ice plant to cost about $150,000. The Baltimore & Ohio Railroad Company plans rebuilding its locomotive repair shops at Connellsville, Pa., recently destroyed by fire with loss of $500,000. Dreamland-in-the-Bay, Inc., Love Point, Md., plans transmission lines to Chester, Stevensville and vicinity. The Bureau of Supplies and Accounts, Washington, D. C., is asking bids until Feb. 14, for six motor-generator sets for the Anacostia navy yard (Schedule 8451). The Bureau of Yards and Docks, Navy Department, Washington, will receive bids (no closing date announced) for electric-operated refrigerating equipment for the marine barracks, Mare Island navy yard (Specification 5523).

## *Volume of Sales on Same Level in Middle West*

Little change in conditions is noticeable in the Middle West. The volume of business remains virtually the same as the previous week with a slight acceleration in some lines. The railroads contemplate large commitments, according to published budgets, and industrial activity is increasing. The various utility companies are busy with construction work and maintenance purchasing is quite heavy. Among the interesting items ordered were four economizers complete with appurtenances, twelve 500-kva. distribution transformers, two 16,000-amp. solenoid-operated air circuit breakers, 43 73-kv. 600-amp. disconnecting switches and 69 25,000-volt potheads.

Construction plans are as follows: Centralia, Ill., plans a municipal power plant. The Nu-Art Engraving Company, Chicago, plans a ten-story addition to cost $400,000. The Rapid Roller Company, Chicago, plans a new plant to cost $250,000. The Iowa Southern Utilities Company, Centerville, Iowa, plans a transmission line and distributing system at different points in Des Moines County. The Providence Hospital, Detroit, Mich., plans an addition to its power plant to cost $45,000. The Consolidated Paper Company, Monroe, Mich., plans a four-story addition to cost $300,000. The Interstate Power Company will build a transmission line from Spencer to Bristow and Lynch, Neb. The Central States Electric Company plans a transmission line from Walthill to Macy, Neb. The Iowa-Nebraska Light & Power Company, Lincoln, plans a 13,200-volt transmission line in the vicinity of Smartville, Neb. The Great Northern Railway Company, St. Paul, Minn., plans electrification of its shops at Grand Forks, N. D., to cost $500,000. M. A. Erickson, operating the Rugby Light & Power Company, Rugby, N. D., plans a power plant at Kenmare, N. D., to cost $75,000. The Dakota Public Service Company will improve its plant and system at Hettinger and Reeder, N. D. The Northern Power Company plans a transmission line to connect with the system of the Hughes Electric Company. Sioux Falls, S. D., plans an ornamental lighting system. The Terminal Warehouse Company, Milwaukee, will soon take bids for a five-story cold storage plant and terminal building to cost $1,000,000.

## *Substation Equipment Ordered in Southeast*

The largest order placed in the Southeast was for substation equipment amounting to about $135,000 for the municipal power plant at Jacksonville, Fla., and the next order in point of size was from a central-station company in the Carolinas for $100,000 worth of power transformers. A power company in Tennessee ordered oil circuit breakers amounting to $40,000, while a Georgia company's order for similar equipment amounted to approximately $30,000. Line material shows an increased activity, some of the orders placed calling for $29,000 worth of aluminum cable and joints, bare and weatherproof copper wire amounting to $14,000, creosoted pine poles totaling $5,600 and $2,600 worth of crossarms and insulators. A central-station company in South Carolina ordered switchboard equipment amounting to $4,000 and a Georgia company purchased distribution and small power transformers amounting to approximately $5,000.

Central station merchandising activities are getting off to good start for the year with many successful sales campaigns under way. One company completed a three weeks range campaign and sold 125 ranges. Orders and inquiries from industrial firms continue to show a healthy increase, the largest order placed being by a steel mill in Alabama for motor equipment amounting to $65,000. Another motor equipment order was from North Carolina and involved $7,000. There is a satisfactory number of small industrial projects under way.

Construction projects include: The St. Petersburg Cold Storage Company, St. Petersburg, Fla., plans a cold storage and refrigerating plant to cost $275,000. The Southeast Georgia Power Company will make extensions in its power plant at Alma, Ga. The Baker County Power Company, Moultrie, Ga., plans a power plant, using Diesel engine units. The Edisto Public Service Company has acquired power plants and waterworks at Allendale, S. C., and vicinity, and will make extensions. The Diamond Ice Company, Knoxville, Tenn., plans an ice plant to cost about $200,000. The Southern Utilities Company will construct a 110-000-volt transmission line from Ridgely to Tiptonville, Tenn.

## *Diversified Sales Mark Trade in New England District*

Wide range in variety, rather than large orders, mark the trend of buying in New England. Small motor orders are outstanding among equipment and supplies and total over $45,000. Orders for loom motor reached a good volume, one of which, amounting to about $5,000, is of interest. Central-station supplies are quiet and confined to small single orders, while wire and hardware are moving well. A manufacturer of switch and control equipment reports an encouraging trend, with orders in view for steady plant operation for some time to come. Arc-welding equipment is selling well. An order was recently placed with a steel fabricating company for a 10-hp. unit, and garages are making inquiries.

Bids will soon be placed on equipment for a 15-mile transmission line in Maine. The Mechanical Devices Company, Inc., Concord Junction, plans to install machinery amounting to about $250,000 and begin operation at an early date. Building contracts filed last week exceeded $14,000,000. The New England Public Service Company plans enlargement of the hydro-electric plant of the Utility Power Company, Bristol, N. H., recently acquired.

## *Industrial Plants Active on Pacific Coast*

Small motor sales are excellent on the Pacific Coast. There is considerable activity in the Kern oil fields. Industrial plant buying is good and well distributed among various industries. Such orders include an electric oven for lumber kiln drying at a value of $2,500, a $1,500 welding equipment for a San Francisco steel company, and 100 1/20-hp. motors for a manufacturer of calculating machines. Power company orders comprise four metering transformers for San Joaquin Valley installation at a cost of $4,000, an assortment of fiber conduit for $30,000 for the city of Los Angeles, a 1,000-kw. turbine generator, valued at $15,000, for Milton, Ore., and $17,000 worth of motors and feeder regulators for the city of Glendale. Miscellaneous bids awarded include a $10,000 wiring contract for an Oakland municipal freight pier; 5 miles of bare copper trolley wire for the San Francisco municipal car system, and 7,500 dry batteries for a steam railroad. New construction announced includes $700,000 for two buildings for chemistry and physics instruction at the southern branch, University of California; a new San Francisco stock exchange building, to cost $1,250,000; a new wing for a children's hospital in San Francisco at a cost of $600,000; an Orpheum theater in Sacramento to cost $800,000; a complete refrigerating system for U. S. Marine Barracks at Mare Island, and a new Masonic temple to cost $500,000.

The St. Paul offices of the Great Northern Railway Company awarded contracts to Seattle electrical concerns for furnishing approximately $250,000 worth of apparatus in connection with completion of electrification of the road over Cascade Mountain. Scattered sales of small motors were made to lumber mills and allied plants by various Seattle jobbers, totaled about 50 units. The Northwest Power & Light Company, Port Angeles, plans another 22,000-hp. hydro-electric unit, costing $2,200,000 on the upper waters of the Elwha River in Clallam County, and the British Columbia Electric Railway Company has completed plans for two substations costing $70,000 in Vancouver, B. C. A $20,000 substation at New Westminster and a $50,000 substation in West Vancouver. Construction of plant buildings for a 50-ton sulphite mill is planned by the Shaffer Box Company at Tacoma. The Kelso Paper Company plans immediate construction of a $300,000 pulp mill to be in operation within six months.

Other construction projects are as follows: The Fresno-Madera Ice Company, Fresno, Calif., will build an ice plant to cost $100,000. The San Joaquin Light & Power Corporation, Fresno, Calif., plans a substation on Ashland Avenue, with 60,000-volt transmission line. The Bowering Soap Company, Long Beach, Calif., plans a new plant to cost $600,000. The Fleischman Company, Los Angeles, Calif., plans a yeast manufacturing plant to cost about $100,000. The Modesto Irrigation District, Modesto, Calif., is asking bids until Feb. 20, for watt-hour meters, transformers and other equipment. The Untica Mines Company, Sacramento, Calif., plans a hydro-electric plant on the north fork of the Stanislaus River to cost about $150,000. The Apple Growers' Cold Storage Company, Watsonville, Calif., plans a one-story cold storage and refrigerating plant to cost about $250,000. The Northern Utilities Company plans a steam-operated power plant in vicinity of Shelby, Mont., to cost about $400,000. Alameda, Santa Rosa, Tulare, Madera, and San Jose, Calif., and the General Development Company, Los Angeles, plans installation of ornamental lighting systems.

## *Street-Lighting Cable Bought in St. Louis District*

The only order of contract size reported in the St. Louis district was for 100,000 ft. of street-lighting cable costing about $10,000. Transformers and control apparatus for three small substations were purchased for industrial concerns. Several electrical sign installations are reported. Manufacturers are shipping stock sizes of motors in good volume. The demand for lighting fixtures and building construction material continues good.

Construction projects are as follows: The Harding Glass Company, Fort Smith, Ark., will extend its sheet glass plant at a cost of $200,000. Marshall, Mo., plans a transmission line for light and power service. The Southwestern Light & Power Company plans to extend its station at Frederick, Okla. The Morgan Utilities Company has secured a franchise at Brownwood, Tex., and plans early construction of transmission line, substation, etc. The Gulf States Utilities Company plans extensions in power plants and transmission lines in vicinity of Port Arthur, Orange, Hull and Jasper, Tex., and plans have been filed for a substation at Beaumont, Tex. Muskogee, Okla., Palestine, San Marcos, Yoakum, and Sweetwater, Tex., and Little Rock, Ark., plan the installation of ornamental street-lighting systems.

# Activities of the Trade

## Westinghouse Gets Condenser and Steel Mill Orders

The Dayton Power & Light Company has placed with the Westinghouse Electric & Manufacturing Company an order for a 33,000-sq.ft. radial-flow type surface condenser together with the necessary auxiliary equipment. The condenser will serve a 25,000-kw. turbo-generator unit recently purchased and will be installed in the Millers Ford station of the Dayton company.

The Westinghouse company also has recently sold a 6,500-hp. reversing blooming-mill motor to the Illinois Steel Company, South Works, Chicago, and a 4,600-hp. motor to the Tata Iron & Steel Company, Punjab, India. The first order includes, besides the motor, a motor-generator set and switching equipment. Another order recently has been received by the company from the Milwaukee Electric Railway & Light Company for a synchronous — visual type of supervisory control equipment. This equipment will control and supervise 29 oil circuit breakers, provide for a transformer temperature alarm, six different current readings and seven voltage readings.

## Simplex Electric Heating Sells Appliance Business

On Feb. 1 the Simplex Electric Heating Company, 85 Sidney Street, Cambridge, Mass., sold its entire wall outlet appliance business to the Edison Electric Appliance Company, Inc., Chicago, which will continue the manufacture and sale of these devices. The Simplex company states that the sale of the wall outlet appliance business does not in any way affect its electric ranges, the manufacture and sale of which will be continued by that company as heretofore.

## General Electric Gets Order for High-Pressure Turbines

Stevens & Wood of New York have recently placed an order with the General Electric Company for two 53,000-kw. steam turbines together with a 12,000-kw. high-pressure turbine for installation in the new Deep Water station in New Jersey opposite Wilmington, Del., to be jointly owned by the American Gas & Electric Company and the American Electric Power Corporation. The 53,000-kw. turbines are of the cross-compound type to operate on an initial steam pressure of 1,200 lb., the steam being reheated in the boilers between the 12,000-kw. high-pressure element and the 41,000-kw. low-pressure element. The temperature of the steam entering into the elements will be 725 degrees. The 12,000-kw. high-pressure unit will be arranged so that the exhaust steam will furnish the process steam requirements of the adjacent plant of the DuPont company.

---

Fairbanks, Morse & Company, Chicago, announces that C. H. Jernberg has become manager of the New York office, succeeding A. C. Dodge, who in the future will be at the main offices at Chicago.

The Hendrick Manufacturing Company, Carbondale, Pa., manufacturer of "Mitco" interlocked steel grating, etc., announces the opening of a Chicago district office at 223 Railway Exchange Building, in charge of Lon Sloan.

The Graybar Electric Company, Graybar Building, Lexington Avenue and Forty-third Street, New York City, has appointed Jerald F. Davis, formerly manager of the Pittsburgh branch, as manager of the Boston branch succeeding T. E. Burger. Mr. Davis was sales manager of the Western Electric Company (predecessor of the Graybar Electric Company) at Boston from 1919 to 1923, and after three years as sales manager of the New York branch was appointed to his Pittsburgh post.

The A. F. K. Fountain Works, 375 Reed Street, Milwaukee, has placed on the market the "A. F. K." vise-work support, by the use of which, the manufacturer says, one man can quickly and safely place a heavy armature in a vise.

The Curtin-Howe Corporation, 11 Park Place, New York City, which holds the commercial rights to the new wood-preservative developed by the engineering laboratories of the Western Union Telegraph Company, has appointed C. Marshall Taylor vice-president and general manager.

The Dampney Company of America, Hyde Park, Boston, Mass., announces that the sale of its "Apexior" protective coatings for power plant equipment will be handled in the Province of Quebec, Canada, by the W. K. Davidson Company, 332 William Street, Montreal, and in central and western New York by the Stone Company, 1219 Commerce Building, Rochester. The company also announces that the new address of its Connecticut representative is 151 Union Avenue, New Haven, Conn.

The Trumbull-Vanderpoel Electric Manufacturing Company, manufacturer of "T. V." safety switches, announces the appointment of Wallace L. Fleming as district representative with headquarters in Chicago.

The Driver-Harris Company, Harrison, N. J. manufacturer of "Nichrome" and other special alloys, announces the opening of an office at 7016 Euclid Avenue, Cleveland, in charge of L. H. Waldrip.

The Benjamin Electric Manufacturing Company, 120 S. Sangamon Street, Chicago, announces an entire new line of Benjamin-Starrett panelboards and steel cabinets for light and power service.

The Riley Stoker Corporation, Worcester, Mass., announces that it is supplying 25 9,000-lb.-per-hour "Atrita" unit pulverizers for the new Hams Hall station, which will supply the city of Birmingham, England.

The Commercial Electrical Supply Company, St. Louis, Mo., has appointed Freeman D. Phillips director of sales. Mr. Phillips was formerly general manager of the H. E. Roberts Electrical Supply Company, of Syracuse, N. Y.

The Frigidaire Corporation, Dayton, Ohio, is presenting to its field organization during the course of eight regional meetings in February, when the 1928 sales campaign is being launched, new household models recently announced by the company and a new electric water cooler designed for use in offices. The first meeting took place at Dayton and regional meetings are being held at Chicago, Omaha, San Francisco, Dallas, Atlanta, New York and Boston.

The Westinghouse Electric & Manufacturing Company announces that W. L. Newmeyer, who has been with the Westinghouse Electric Company of Japan, has been selected to represent the company in China.

The Robbins & Myers Company, Springfield, Ohio, has placed on the market its new 8-in. model 50 and 10-in. model 51 alternating-current nonoscillating fans in golden green finish.

The Corning Glass Works, Corning, N. Y., announces that Henry M. Hughes has been appointed representative with headquarters at the Oliver Building, Pittsburgh, to handle the sales of "Pyrex" power insulators in the state of Pennsylvania west of Harrisburg, West Virginia and counties in Ohio adjacent to the Pennsylvania and West Virginia lines.

The Graybar Electric Company, Graybar Building, New York City, has opened an office and warehouse in Roanoke, Va., at Salem Avenue and Sixth Street, with W. E. James as sales manager.

The Eureka Vacuum Cleaner Company, Detroit, is manufacturing a new cleaner known as the Eureka auto cleaner for many special cleaning purposes in homes, garages and business establishments.

The Martindale Electric Company, 1260 West Fourth Street, Cleveland, announces that stocks of the most popular sizes of commutator stones are being carried at the New York branch, in charge of E. H. Mitcham, 6 East Forty-sixth Street, New York City, and the Los Angeles branch in charge of John M. Dexter, 210 East Third Street.

The Bryant Electric Company, Bridgeport, Conn., announces the No. 6279 standard heater type switch as one of the complete Bryant line of heater and range type switches. It is rated at 20 amp., 125 volt or 10 amp., 250 volt. It has reversible rotation with indicating handle and is a single pole, series parallel, three-heat unit.

The Pacific Electric Manufacturing Company, 5815 Third Street, San Francisco, announces the appointment of W. G. Robertson as sales representative at Atlanta, Ga. Mr. Robertson was formerly with the Phoenix Utility Company.

The Sentinel Manufacturing Company, 5100 Superior Avenue, Cleveland, has purchased the "Laun-Dry-Ette" wringerless electric washing machine and is now making shipments of the latest model. F. C. Maxhimer is president of the Sentinel company, Albert G. Cook, vice-president and treasurer, J. L. Davis, secretary, and Fred C. Bach, sales representative.

The Boiler Engineering Company, 931 Federal Trust Building, Newark, N. J., announces that it now owns and controls the Turner baffle wall and henceforth can supply customers with either the "Beco" or the Turner.

The Candalite Company, 410 Eleventh Street, West New York, N. J., is producing a new type of lamp, known as the Candalite, which is a replica of a hand-dipped candle.

The Roller-Smith Company, 233 Broadway, New York, manufacturer of instruments, relays and circuit breakers, announces the following changes in its sales organization: S. H. King has been added to the sales force in New York and will operate in the Metropolitan district; Albert Milmow, Latonia Building, Charlotte, N. C., has been appointed exclusive agent for the states of North and South Carolina; M. B. Mathley, Monadnock Building, Chicago, has been appointed exclusive agent for the Chicago territory, superseding M. Frankel, who has been representing Roller-Smith in the Chicago territory for many years. Mr. Mathley has been associated with Mr. Frankel during that period, and W. J. Schuhmann, who has been connected with the New York office of the company for many years as a sales engineer, has been transferred to the works at Bethlehem, Pa.

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued Jan. 24, 1928)

1,656,898. Metallic Vapor Lamp; R. L. M. Belleaud and J. Barrollier, Courbevoir, France. App. filed Jan. 30, 1924.

1,656,912. Double Pole Electrical Connecter; C. E. Foster, Letchworth, England. App. filed Aug. 6, 1924. Of the concentric kind.

1,656,952. Push Button for Electric Switches, Etc.; B. W. Nutt, Lakewood, O. App. July 10, 1924.

1,656,962. Synchronizing Mechanism; E. A. Sperry, Brooklyn, N. Y. App. filed Sept. 18, 1920. Means for insuring the driving of a member at a constant speed and in synchronism with a constant speed device such as a clockwork mechanism.

1,656,972. Electric Converting Apparatus; J. E. Calverley, Preston, and W. E. Highfield, London, England. App. filed April 25, 1925.

1,656,989. Lightning Arrester; R. G. Sands, Waukegan, Ill. App. filed Sept. 11, 1925. As used on telephone circuits.

1,657,000. Cord Grip for Electric Fittings and Appliances; W. V. Butterfield, Greenfield, England. App. filed July 1, 1926.

1,657,001, 1,657,002, 1,657,003. Electric Switch; G. L. Cragg, Chicago, Ill. Apps. filed Jan. 24, Feb. 18 and March 17, 1927. Current conducting winding elements and circuit controlling switches.

1,657,004. Circuit Connecter; H. A. Douglas, Bronson, Mich. App. filed Sept. 3, 1925. Plug contact type.

1,657,035. Suspension Insulator with Hood and Deformable Pivoting System Forming an Articulated Joint; A. Richard, Milan, Italy. App. filed April 9, 1923.

1,657,040. Electric Switch; W. Schmid, Bronson, Mich. App. filed April 11, 1927. Wherein reciprocable rods are employed for effecting their operation.

1,657,053. Electrical Contact; J. A. Weiger, Union City, N. J. App. filed Oct. 9, 1926. Supports for tungsten contact points.

1,657,056. Intermittently Operating Electric Regulator; A. Ytterberg, Ludvika, and A. Garge, Vasteras, Sweden. App. filed April 22, 1926. Which may be applied to voltage, current, speed, or any other quantity of the machinery capable of being regulated in an analogous manner.

1,657,060. Incandescent Electric Lamp and Method of Producing the Same; A. L. Becket, East Orange, N. J. App. filed Jan. 30, 1925.

1,657,103. Current Flow Indicator; C. Berger, New York, N. Y. App. filed Dec. 31, 1921. Applying thermoscopic substances for indicating visually by readable characters temperature conditions which are a function of temperature, such as flow of current in an electric circuit.

1,657,105. Wireless Synchronizing Clock System; J. W. Bryce, Bloomfield, N. J. App. filed March 23, 1925.

1,657,144. Electric Steam Generator; A. N. Armstrong, Norwich, N. Y. App. filed Feb. 10, 1926.

1,657,149. Diathermy Apparatus for Sinus Treatment; De Forest B. Catlin, Boston, Mass. App. filed Aug. 11, 1926.

1,657,189. Cigar Lighter; F. Bain, Chicago, Ill. App. filed Oct. 16, 1926.

1,657,191. Electrical Indicating System; P. D. Barrett, San Francisco, Cal. App. filed Nov. 30, 1925. For theaters and the like.

1,657,204. Electric Griddle; K. Ehrgott, Erie, Pa. App. filed Sept. 12, 1925.

1,657,205. Electric Bake Oven; K. Ehrgott, Erie, Pa. App. filed Nov. 12, 1925.

1,657,207. Electrical Fuse; A. Fernandez, New York, N. Y. App. filed Sept. 4, 1926. Socket fuses.

1,657,232. Light Signal; C. S. Snavely, Pittsburgh, Pa. App. filed Aug. 11, 1923.

1,657,239. Motor Control; C. C. Clymer, Schenectady, N. Y. App. filed Dec. 23, 1926. Control of electric motors operating in what is known as the Leonard system.

1,657,248. Carrier Wave Coupler; W. Dubilier, New York, N. Y. App. filed Sept. 3, 1924.

1,657,249. Capacitance Transformer; E. D. Eby, Pittsfield, Mass. App. filed May 27, 1927

1,657,251. Electric Control System; A. C. Finney, Schenectady, N. Y. App. filed June 5, 1924. For the control of field windings.

1,657,252. Secondary or Storage Battery; B. Ford, Philadelphia, Pa. App. filed May 2, 1927. Sealing closure.

1,657,253. Connecter for Electric Conductors; P. R. Fortin, Schenectady, N. Y. App. filed Sept. 10, 1924.

1,657,258. Electric Protective Device; M. R. Hanna, Erie, Pa. App. filed March 19, 1925. For preventing the frame or other normally insulated part of the electrical apparatus from acquiring an excessive or dangerous potential in case the insulation should become defective.

1,657,262. Electric Metering System; V. Karapetoff, Ithaca, N. Y. App. filed Oct. 5, 1923.

1,657,303. Phase-Failure and Phase Reverse Protective Device for Polyphase Alternating Current Circuits; C. T. Evans, Milwaukee, Wis. App. filed Jan. 3, 1921.

1,657,306. Curling Iron; H. D. Gursky, Gloversville, N. Y. App. filed Nov. 26, 1926.

1,657,320. Automatic Circuit Breaker; A. Roth, Bron, near Lyon, France. App. filed March 24, 1926.

1,657,336. Electric Switch; C. E. Anderson, Stratford, Conn. App. filed Aug. 15, 1923. Flush switch.

1,657,337, 1,657,338. Electric Switch; C. E. Anderson, Stratford, Conn. Apps. filed Sept. 24, 1924, and Jan. 23, 1925. Rotary snap switch.

1,657,340, 1,657,341. Insulator Pin; A. O. Austin, Barberton, O. Apps. filed May 12, 1920, and Sept. 4, 1925.

1,657,358. Cigar Lighter; I. I. Hance, Meriden, Conn. App. filed Sept. 2, 1926.

1,657,433. Turbo-Generator Installation; K. Frey, Ennetbaden, Switzerland. App. filed April 11, 1927.

1,657,445. Induction Regulator; P. Suter, Baden, Switzerland. App. filed Jan. 25, 1926.

# New Trade Literature

RELAYS. — The General Electric Company, Schenectady, N. Y., is distributing bulletin GEA-847 describing and illustrating the type IJ induction differential relays, giving their method of operation and general application.

INSULATING MATERIALS.—The Mica Insulator Company, 200 Varick Street, New York City, has issued a price list effective Feb. 1, 1928, covering its "super micanite" and other electrical insulating materials.

NICKEL-CAST IRON—Bulletin No. 205, entitled "The Practical and Economic Value of Nickel and Chromium in Gray Cast Iron," has been issued by the International Nickel Company, 67 Wall Street, New York City.

LIGHTING UNITS.—The General Electric Company, Schenectady, N. Y., has issued bulletin GEA-715A covering the "Novalux" ornamental lighting units, form 12, for street lighting. The company is also distributing bulletin GEA-907 describing aviation beacons.

MAGNETIC SEPARATORS.—The Cutler-Hammer Manufacturing Company, Milwaukee, has issued catalog P-26, entitled "Magnetic Protection," giving complete information on magnetic separator pulleys. The catalog gives in detail the construction and design of all types of separator pulleys and contains tables giving the cubic-feet per hour capacity of all separator pulley sizes and the correct width and thickness of the belts to be used.

DISTRIBUTION TRANSFORMERS. — The Packard Electric Company, Warren, Ohio, is distributing bulletin 200-B, in which it describes and illustrates its distribution transformers. It also contains a description of its coil and core construction supplemented by photographs of various departments such as the assembly department, coil winding department, etc.

ELECTRIC WELDERS.—The Thomson Electric Welding Company, Lynn, Mass., has issued a bulletin describing its various types of spot welders, butt welders and seam welders. Photographs and a complete description of each type of welding machine are included. Enlarged views of the working parts of some of the welders are shown.

PIPE HANGERS, FIXTURE HANGERS, UNIONS AND CONNECTORS. — The Crouse-Hinds Company, Syracuse, N. Y., is distributing bulletin No. 2,107, describing and illustrating the various types of "Wedgtite" pipe hangers, flexible fixture hangers and self-threading unions and connectors.

ELECTRICITY FOR THE FARMER.—The General Electric Company, Schenectady, N. Y., has issued bulletin GEA-444A, the third edition of "The G-E Farm Book," in which it calls attention to the things that electricity can do for the farmer. Many illustrations are given showing the various uses of electrical devices on the farm.

BLOWERS.—Catalog No. 32 issued by the Bayley Blower Company, Milwaukee, describes and illustrates the Bayley "Aerovane" blowers. Dimension diagrams and complete blower data are also included in the catalog.

FANS.—The Robbins & Myers Company, Springfield, Ohio, has issued a pamphlet describing its 8-in. model 50 and 10-in. model 51 alternating-current, non-oscillating fans in golden green finish.

RECORDING WATTMETERS.—Catalog No. 1502 issued by the Bristol Company, Waterbury, Conn., describes and illustrates the Bristol round chart and strip chart recording wattmeters and recording frequency meters. Wiring diagrams and a sample chart are included and attention is called to the electric motor operated clock furnished with Bristol's recorders when desired.

DRY-QUENCHING OF COKE.—The Dry Quenching Equipment Corporation, a subsidiary of the International Combustion Engineering Corporation, 200 Madison Avenue, New York City, is distributing catalog DQ-2, describing the Sulzer system for the dry quenching of coke.

LABORATORY APPARATUS.—"Laboratory Apparatus for Educational Institutions" is the title of a 48-page circular published by the Westinghouse Electric & Manufacturing Company. The circular gives complete information of apparatus for the school or engineering laboratory, arranged in convenient form. Many photographs, line drawings and characteristic curves are included.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

Purchase is desired in Duranzo, Uruguay (No. 29,395), of storage batteries for automobiles and trucks.

An agency is desired in Penang, Straits Settlements (Nos. 29,458), for flash lights and other electrical supplies.

An agency is desired in Dresden, Germany (No. 29,386), for floor-surfacing machines, and electric portable tools.

Purchase and agency are desired in Hong Kong, China (No. 29,407), for household electrical appliances.

An agency is desired in Zurich, Switzerland (No. 29,413), for household electrical appliances.

An agency is desired in Prague, Czechoslovakia (No. 29,397), for electric refrigerating units using sulphur dioxide.

Purchase and agency are desired in Koonstanz, Germany (No. 29,393), for household gas-electric refrigerators.

An agency is desired in Magdeburg, Germany (No. 29,396), for electric safety razors.

An agency is desired in Medellin, Colombia (No. 29,476), for electric signs, electric stoves and floor lamps.

An agency is desired in Sydney, Australia (No. 29,455), for telephone apparatus.

Purchase or agency is desired in Le[illegible], Germany (No. 29,394), for washing and ironing machines.

An agency is desired in Catania, Italy (No. 20,410), for wiring supplies.

VOLUME 91 *New York, Saturday, February 18, 1928* NUMBER 7

## *The Lesson of Careers Like That of William Eglin*

MOURNED by a host of friends, W. C. L. Eglin, vice-president and chief engineer of the Philadelphia Electric Company, was laid to rest on Feb. 10. His life's work with the Philadelphia Electric Company, his labors in behalf of the historic Franklin Institute, his contributions to the National Electric Light Association and kindred organizations, as they flash upon the remembrance, all teach a lesson to every one in the industry struggling for his place in the sun. Mr. Eglin started at the bottom as a switchboard attendant and rose step by step to the positions of honor and authority he held at the time of his death. No work was too arduous, no task too exacting for him to undertake. Handicapped at first as all self-made men are, he overcame the difficulties which stood in his way and, under the urge of ambition and in the confidence begotten by years of struggle, he progressed and finally triumphed. What he may have lacked in brilliance he more than made up in service, and it was for service that Philadelphia respected and honored him and that his fellows in the industry admired him. This country abounds with opportunities for those eager and willing to work, and its greatness is predicated as much on the labors of myriads of men who, like Mr. Eglin, have fought "a good fight with all their might" as on the largess that it is able to bestow.

* * * *

## *Values in Management*

BECAUSE of management the light and power industry has grown into mass production of energy, long-distance transmission, interconnection, rural service, industrial applications and home conveniences. It is the product of the energy, the brains and the ideals of the men who direct it, and because of their ability it has grown, continued to extend its service and remained financially healthy. Management is often forgotten in a stock taking of the industry. It is not generally recognized that the material accomplishments so evident on every hand are only monuments to individual enterprise and initiative. Management is responsible for a constantly improved and extended service at a constantly decreased price. The situation has developed a logical succession of engineering and economic steps taken by courageous leaders of men.

Capital requirements of the light and power industry have increased faster than the revenues. But management never hesitated on this account and went ahead with its program for better and more extended service. It offset higher fixed charges by lowering interest rates and operating costs. Mass production and interconnection are characteristic. One pound of fuel in 1927 did as much work as three pounds of fuel did in 1913, and other economies in labor, material and reserve equipment, to say nothing of standardization and concentrated purchases, kept the price of electric service progressively decreasing. Feats of management lie behind the figures and structures that represent the physical assets of the industry.

* * * *

## *Decentralized Purchasing Seeks Its "Place in the Sun"*

CENTRALIZED management is synonymous with headquarters purchasing on many properties. Many economies have been reaped through bulk buying and will continue to be gained in this way, but of late the opinion has been expressed in manufacturing circles that in some cases the pendulum has swung too far away from local executive authority to yield the best all-around results. This viewpoint is not confined to purchasing problems, but appears every now and then in connection with nearly every phase of holding-company management in relation to the conduct of affairs in subsidiary properties. The subject is too large for exhaustive treatment in a few paragraphs, but it is especially important in the readjustment period through which many companies are now passing as a result of the transfer of financial control.

The picture of the headquarters purchasing agent and his supporting technical advisers nonchalantly awarding contracts to equipment and supply manufacturers' executives for a year's requirements of a dozen or two local properties to whose managers little voice in the selection of apparatus and material has been given has doubtless been drawn with exaggerated lights and shades by many who fear that decentralized purchasing has lost its place in the scheme of things. A word of warning has its uses, however. With all the recognized benefits of centralized management—and these are undeniable—it would be most unfortunate if headquarters policies, intentional or otherwise, should be such as to produce the "rubber-stamp" type of subsidiary property executive. Increased responsibility is the key to success rather than diminished influence.

Obviously the crux of the purchasing problem is to obtain the best equipment and material for a given purpose at the lowest over-all cost. The line of solution is sharply defined in the maintenance of close and continuous contact between headquarters and local properties, in inviting advice and suggestions from local executives and staff members as to the choice of material and apparatus for particular needs, in allowing reasonable latitude for routine local purchases, and in co-ordinating whenever possible the demands of scattered systems. Final decisions in important cases may still reside at headquarters; but if these problems are determined along engineering and economic lines, the chances in favor of awards satisfactory both locally and at the home office of the syndicate will be multiplied. Perhaps the most essential point in the whole affair is that nothing shall be overlooked that will help in making local needs clear to those far from the scene. As time passes adjustments take place which tend to bring about a proper division between centralized and decentralized buying in any particular organization. With a proper approach to the problem and an open-minded desire to meet the conditions most efficiently, neither headquarters men nor local managements nor manufacturers need expect other than successful purchase administration.

* * * *

## *Serving Two Masters Successfully*

NEGLECTING the corporate economy or desirability that may result from combining the electric company and the gas company in the same community, there remains the question of separate or unit service in those instances in which close financial or managerial conditions exist. Many utilities have found it to be desirable to have one trouble gang take care of complaints and emergency work for both electric and gas services. The economies in labor, supervision, equipment, time and money are obvious, but the suggestion is often productive of heated derision from those who have never tried it. Gas men are incredulous of the ability of their otherwise intelligent partners in utility service to comprehend the problems of a kindred activity. Men of the electrical division are, with at least understandable misgivings, dismayed at the thought of a mere gas man being able to grasp the somewhat exaggerated complexities of their field.

Where the electric-gas service-man plan has been tried for any considerable period of time there are few objections manifested. Some interdivision training is necessary, but the difficulties are few and the merits numerous. There are still many opportunities of a similar character in most organizations. The old story of lost hours and energy, of idle dollars, is never downed; it is as always a relative thing and not an absolute one.

* * * *

## *Another Commercial Contest and a Good One*

CONTESTS are one of the oldest forms of sport. It is natural enough therefore that in the field of business the competition idea should have been seized upon as a stimulus to salesmen; and though each new contest is apt to be greeted with the exclamation "What? Another!" it is still a good idea. In the electrical industry the criticism most often has been that the competition was a complicated affair, involving much labor and expense with an intricate scheme for evaluating results. But the "residence-kilowatt-hour contest" announced by the N.E.L.A. Commercial Section is refreshingly simple and appealing. It is a direct drive at a most desired objective. It is open and fair to all. It will entail no extra cost or work either to enter, to participate or to report. And so no wonder that letters are rapidly coming into the merchandising committee from power companies in all sections of the country saying that their sales departments are going to battle for the $9,000 prize money.

In a word, three first prizes of $2,000 and three second prizes of $1,000 are offered to those power companies, classed in three groups, that show the greatest increase in average consumption per residence customer during the year 1928. The groups embrace those companies whose present status might be called backward, average and advanced as concerns the development of residence load. Their achievement for the year will be reckoned by comparing their total average annual consumption for 1927 with the like figure for 1928. Each company will compete in its own class.

Two features of the contest are very appealing. First, as the ratings of the contesting companies are published from time to time, it will focus the attention of each company upon its own average residence consumption. All are ridiculously low when one compares the present possibilities of the market. Some are "plain pathetic." Some companies do not even know what their average is. But before this contest is done many sales managers and executives will have discussed why their company is classed as backward or compares so unfavorably with this community or that, and hurt pride will have goaded much inertia into action.

The fact that the prize money for the contest is being given in small amounts by a large number of manufacturers and others is also excellent. The industry has gone too often to a few large companies for special contributions. This time there will be a long list of subscribers, with nobody burdened and everybody interested. This contest should do a lot of good. Every central-station company should enter.

## *Supervising Power Sales*

SUPERVISION of power sales activities varies widely among electric utilities. In some cases the commercial manager is responsible for the work of specialists in motor applications, industrial lighting, heating, rate making and contract drafting. He may have a pretty free hand, coming in contact with executives only for approval of budgets, requests for special reports and general guidance based on their broad knowledge of company development and its larger relations to the communities served. In other instances the power sales head may report directly to the general manager and perhaps maintain contact with a vice-president in the absence of a sales manager. Supervision may be close or elastic.

It is natural for a high-grade man of the type of a trained power sales engineer to function most effectively with a moderate amount of supervision. In a sense, such men are picked officers of the commercial advance guard, and the best results come from permitting them a large degree of freedom. Combat aviators cannot do their best work under the normal rigidities of military rule, and power engineers in their own way need to be free to go and come at will and to attain their objectives largely along their own lines of attack if maximum success is to be realized in customer relations and volume business. This kind of work involves sustained effort without regard to office hours; in fact, it is highly professional in character and as such deserves the privileges as well as the responsibilities of such an occupation.

The responsibility of the power engineer has increased steadily in late years, and his outside contacts and the breadth of his interests are putting him in a position to render more and more useful service to his superiors. His executive does well to expect certain definite results from his service without imposing narrow restrictions upon how these shall be achieved. On the other hand, executive interest in the work should be active and always in close touch with major negotiations in progress, familiar with the trend of economic studies in the power department, appreciative of when best to join forces with the power sales staff in direct dealings with customers and "prospects," and skilled in guiding the general procedure in harmony with company policies. All this can be done without requiring the executive to become too deeply immersed in detail if the power sales staff prepares first-class reports, summarizing situations with skill and including supporting data for such checking as executives may care to undertake directly or with the aid of outside advice. Unless close supervision, without narrow oversight, is accorded, it becomes difficult for executives to capitalize their own relations with industrial leaders and other important power customers in helping the power sales department to obtain and hold business. On the whole, a very high grade of team work is evident in the power industry in the above directions; sales engineers as a rule have deserved the liberty of action given to them, and apparently the principal opportunity for improvement lies in the direction of more complete economic reports. These are admirably prepared in a host of companies, but in many others are still lacking in comprehensiveness and in "make-up," to borrow a term from the editorial office.

## *How Much Light Does the User Want?*

HUMAN eyes evolved outdoors under thousands of foot-candles of daylight. This fact alone points a questioning finger at the intensities of a few foot-candles which generally prevail in artificial lighting. However, to convince the user of light that he needs higher intensities of illumination for efficient work at maximum comfort actual data are necessary. These are being obtained in research laboratories, in factories and other workplaces. The consequence is that progressive executives are beginning to give some attention to the matter of lighting at these higher intensities. Already there are a number of unusual installations. An automobile-body plant is using 50 foot-candles with the so-called tungsten "daylight" lamp. A tile factory employs 150 foot-candles where the product is sorted. A few factories are using 30 to 40 foot-candles, and one large office at least is provided with 25 foot-candles in some places.

As we look back a decade or two we find a steadily increasing tendency toward higher intensities of illumination. Much of this is due to the glowing examples of the productiveness of good lighting. However, there is another very interesting phase—the user's natural tendency to use more light when he can get it. This was recently investigated by a laboratory noted for its researches in lighting and vision. About twenty-five observers were used, and they were permitted to choose independently the intensity of illumination desired for reading. Unknown to the observer, the maximum intensity of illumination available was different on each of five days, ranging from 10 foot-candles to 100 foot-candles. It is interesting to note that the average intensity chosen always depended upon the maximum intensity available For quite a range it was very roughly half the available intensity. The lighting conditions were satisfactory and the intensity of illumination was the only factor which was altered.

From this the interesting conclusion may be drawn that the user will choose to use more light if more is available. With this tendency supported by the demonstrated economic value of good lighting, it should not be difficult to have higher intensities of illumination introduced in most workplaces. Furthermore, the upper limit does not seem to be in sight.

## *New Type of Street-Lighting Rate Desirable*

ON THE larger utility systems serving many cities and towns several different street-lighting rates often are in effect. Usually a flat rate per lamp is charged, and the rate is not always logical and equitable. Often the rates are based upon expediency and do not recognize quantity use and other principles entering into costs and rates. A solution has been suggested whereby the street-lighting rate includes a charge for energy based on the prevailing commercial lighting or power rate and another covering maintenance and fixed charges. The resulting rate would recognize demand, load factor and energy consumption—three factors that should enter into all rates. Based upon these charges, a rate per lighting unit could be worked out for groups of 100, 200 and on up to any maximum number of lamps desired. Any city or town would then earn the rate to which it was entitled according to the number of street lamps. The rate could be a matter of published tariff and as easily justified as the commercial lighting or power rate applicable to the particular community.

Utilities are interested in street lighting from many aspects and can well afford to put some thought on rate systems which more nearly reflect the technical and commercial aspects of the art as it exists today. Street lighting can be made good business if it receives adequate attention.

## *Maintenance of Primary Customers' Service Equipment*

WHO should take care of the maintenance of transformers and circuit breakers at the plants of industrial customers? The reconditioning of insulating oils and the proper adjustment of contacts and mechanism is as important at one end of the circuit as at the other, yet privately owned equipment goes untouched or incompetently serviced for long periods—often to the point of failure. Except in large installations where a definite provision is made for such work, the industrial plant operators have neither the equipment nor the familiarity with procedure which is requisite for satisfactory results. The job, when recognized as important, is postponed even unto the day of inevitable reckoning. The oil used for replacement has probably stood in containers exposed to a climate of destructive propensities, reclaiming equipment is in the condition induced by disuse, and instruction books are mislaid.

It is one of the many and increasingly numerous duties of the electric light and power companies to advocate definitely, ascertain, and if necessary perform, the servicing of transformers and main breakers in the plants of industrial customers. It takes but little persuasion to convince the customer that the power company should do the job. The cost charged should, if necessary, be nominal. It is a vital and important phase of service.

# Residential Water Heating

Investigation and tests made by the Northern States Power Company in order to serve electric water-heater load at attractive rate and at a comparatively low investment cost per customer

By R. R. Herrmann and K. R. McClung
*Northern States Power Company, Minneapolis, Minn.*

In nearly all range-equipped residences the hot water problem is not satisfactorily solved, especially during the summer months. Customers enjoying the convenience of an electric range also demand some practical means of heating water, and the desire of electric companies to render such service is manifested by their present and past interest in the subject.

An electric water heater will be a relatively large kilowatt-hour user. Assuming an average use of 50 gal. of water per day, heated through a temperature rise of 100 deg. F. (50 deg. to 150 deg. F.), the energy used per month will be approximately 400 kw.-hr. This means that the water heater will use more than double the kilowatt-hours used by the range, lights and appliances combined and will more than treble the present kilowatt-hour consumption of a residence so equipped. Although a large number of kilowatt-hours are used per month, the value of the service rendered will not permit too great a charge except in special cases. A low rate is, therefore, necessary for this class of service.

The operating company has in this class of business a method of increasing its summer load, improving its load factor, using otherwise idle distribution and generation equipment and, at the same time, increasing its net revenue.

A survey of the various types of electric water heaters on the market shows that all makes may be grouped into the following classes:

I—Instantaneous Systems.
    (A) Automatic control.
        1. Large wattage heater; no storage tank.

II—Storage Systems.
    (A) Automatic control; thermostat.
        1. High-wattage circulation type heater; comparatively small tank, fairly well insulated.
        2. Small wattage "immersion" or "clamp-on" heater; large storage tank, well insulated.
    (B) Manual control.
        1. Large wattage circulation type heater; comparatively small tank.

The instantaneous system operating without storage tank and supplying hot water instantaneously must have a heating element of high wattage. If water is drawn at the rate of 1 gal. per minute and is heated from 50 deg. F. to 150 deg. F. the heater will be required to supply 100×8.33, or 833 B.t.u. in one minute. At this rate of consumption about one-fourth of a kilowatt-hour will be used in one minute, which is equivalent to a demand of 15 kw. Obviously, this type of heater cannot be used on residential lines where loads of such size would cause serious voltage fluctuations.

Storage systems of the automatic and manually controlled types have been most commonly used in the past. Circulation and immersion heaters of comparatively high wattage (5,000 watts) have been used in connection with comparatively small storage tanks. Storage systems employing low-wattage heating elements and large storage tanks are of later development.

Since some manufacturers advocate a small heater with a large tank, well insulated, and others a small tank with a large heater, steps were taken by the Northern States Power Company to ascertain, if possible, what sort of water heater should be advocated and sold to its customers at the present time. The high-wattage circulation type of heater, being the type most largely in use, naturally was given first consideration. Data on installations of this type indicated that there would be little improvement in load factor resulting from its use. Furthermore, with heaters of this type, either manually or automatically controlled, it was felt that even with a large diversity in use the average peak demand would be too large to merit a low rate. Accordingly, an attempt was made to devise a system which would have a good load factor and little peak responsibility.

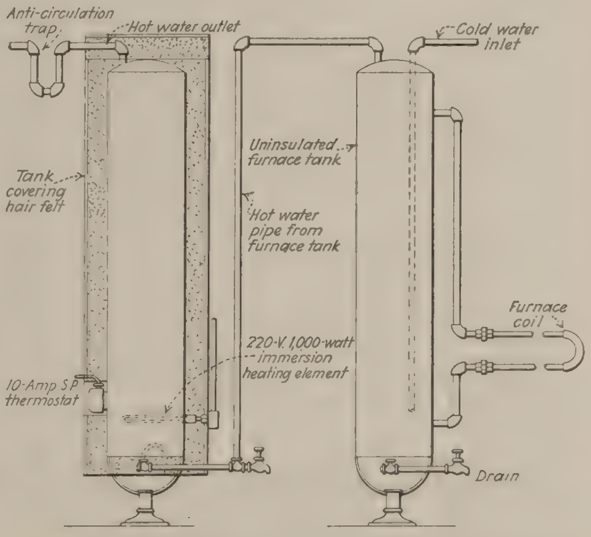

FIG. 1—ELECTRIC WATER HEATER INSTALLED WITH FURNACE TANK

Having in mind the desirability of a good load factor, and at the same time the satisfaction of the customer, the following method of water heating was suggested:

Two heating elements, one of small capacity, approximately 150 watts, and the other of large capacity, possibly 3,000 watts, were to be used. The small element was to be located at the bottom of the storage tank and to be in operation continuously. The large heater was to be placed in a circulating pipe along the side of the tank and was to be turned on manually, with a suitable means for turning it off, either when the temperature of the water reached the desired point or after a certain time had elapsed. The idea back of this suggestion was that the small heater would supply the radiation losses of the tank and would just equal these losses when the temperature of the water reached 220 deg., which would be the condition when no water was withdrawn from the tank for a period of a day or so, thus eliminating any temperature control for the small element. Since the small element would, therefore, give a 100 per cent load factor, it was felt that the energy for the same could be sold very cheaply. Since the large heater would be operated intermittently throughout the day and would have a much poorer load factor, it seems reasonable that this large heater should not deserve the same rate for energy as the small heater, but, instead, a higher rate. The rate schedule in Minneapolis has a low step of 3 cents per kilowatt-hour with 5 per cent discount for prompt payment, and it was suggested that the energy for the large heater should be metered through the regular house meter and thus be billed at the 3-cent rate.

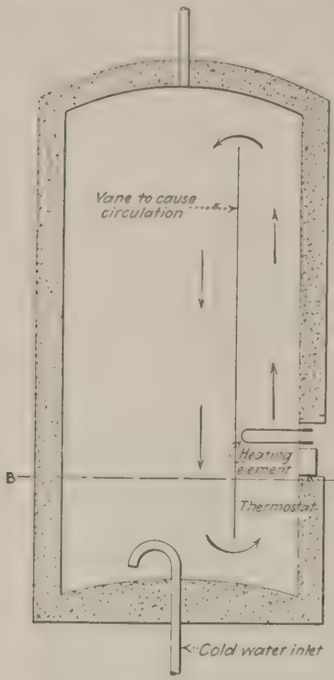

*Fig. 2 — Cross-section of electrically heated tank with circulation plate*

Note.—When sufficient water is used to bring cold water up to line *BB*, the thermostat operates, turning on the heating element. Heating element stays on until portion below *BB* is heated, due to circulation.

Accordingly, several installations were made in the homes of employees along the lines suggested. With the small heater just large enough to take care of radiation losses, it was found that the large heater (3,600 watts) was being used so frequently that the customer's bill at the rates suggested above would be too great to promote the business.

### Tests on Types of Water Heaters

Discussion of the system raised the point regarding the relation between the kilowatt-hours consumed by the large size heater and the size of the small heater. If the small heater were increased in size from 150 watts to 500 watts or so, besides supplying the radiation losses, this small heater would supply an additional amount of hot water, thus reducing the number of times which the large heater would be used. In this case, however, it would be necessary to have the small heater thermostatically controlled, since the temperature of the water would rise to an unduly high point if little or no water were used during an interval of a day or more.

In order to ascertain what size of small heater would supply the majority of requirements the large heater (3,600 watts) in the side arm circulating pipe of several installations was then placed in automatic operation, turning on when the temperature of the water fell to a certain point and turning off when a certain temperature had been reached. Fig. 4 shows the variation in the temperature of the water in one tank during a 24-hour period with this arrangement.

It will be seen that there is a great variation in the temperature of the water as recorded by a thermometer placed 4 in. from the top of the tank. This is due to the fact that the thermostat controlling the large heater was placed at the bottom of the tank and the circulation of water was not free enough to keep a more even temperature between the bottom and the top.

The wattage of the large heater was next reduced to 1,800 and the small heater was left the same as before and, also, in operation continuously as before. A temperature and demand chart are shown in Fig. 5. There is not as great a variation in the temperature of the water as before, which is probably accounted for by the fact that as rapid circulation as before was not required to distribute the temperature.

The improvement in the operating conditions shown by this last arrangement suggested reducing the size of the large heater from 1,800 to 900 watts, leaving it thermostatically controlled as before. A temperature chart is shown in Fig. 6 and is a considerable improvement over the temperature chart shown in Fig. 5. Besides the improvement in the temperature chart, there is also an improvement in the load factor over the previous two conditions of operation, as may be noted by referring to the demand charts.

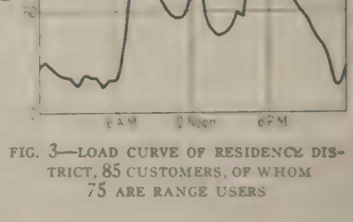

FIG. 3—LOAD CURVE OF RESIDENCE DISTRICT, 85 CUSTOMERS, OF WHOM 75 ARE RANGE USERS

It will be noticed that under the last condition of operation the wattage of the two heaters combined is close to 1,100. In this particular installation the tank was a 30-gal. tank covered with 2 in. of hair felt. The radiation loss of the tank alone amounted to approximately the capacity of the small heating element. The radiation loss of the large heater in the circulating pipe was, however, a considerable amount, being approximately 125 watts. The small immersion heater was next increased in size to 800 watts and was controlled by the thermostat. The circulation, or 3,600-watt heater, was rewired so that it was manually controlled, the idea being to find out how often this large heater would be turned on to take care of such cases when all water would have been withdrawn from the tank and more hot water desired immediately. Fig. 7 shows a temperature chart of the water, and the accompanying demand chart shows that the large heater was not turned on during this period, which means that the 800-watt heater supplied all of the hot water used by this household during the 24 hours. Charts taken over a two-week period show that only twice during this time was it

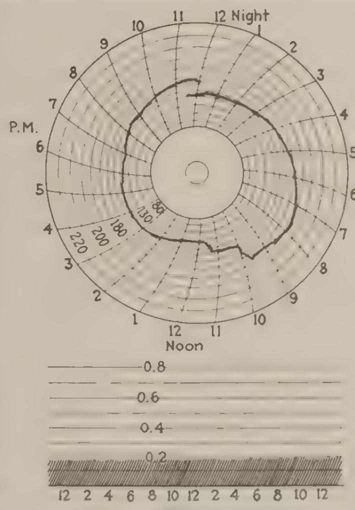

FIG. 7

necessary to utilize the 3,600-watt circulation type water heater.

If the size of the tank had been 60 gal. instead of 30 and had been well insulated it is doubtful whether the large heater would have been turned on at all during the two-week period. This led to the recommendation that for the time being a 1,000-watt heater would be supplied with a well-insulated tank of fairly large capacity. Installations made along these lines during the spring and summer have resulted in no complaints whatever.

Table I shows more in detail the results of the tests described above. It will be seen that the 800-watt immersion heater supplied all of the hot water required, even though the 3,600-watt heater remained in the circulating pipe, with its consequent radiation loss. This customer is a rather large user of hot water. Other installations show a consumption as low as 30 gal. per day.

Table II shows the kilowatt-hours consumed by five customers selected at random. Each of the tanks was equipped with a 1,000-watt immersion heater automatically operated, to cut out when the water reached a temperature of about 150 deg. Several thermostats set to operate at about 175 deg. caused complaints of water being too hot, so they were reset to operate at 150 deg.

In deciding upon the proper rate and apparatus for supplying household requirements, the following conditions must be carefully considered: First, the value of the service to the customer necessitates a low rate for energy; second, hot water service, not electric, is desired by the customer; third, for a given hot water use a certain number of kilowatt-hours must be supplied during any given period and the time during which these are supplied directly affects the cost to both customer and company.

In comparing electric heating with other forms, such as gas, oil, coal or wood, it must be remembered that the thermal efficiency of the electric heater is the greatest. Other systems require a vent pipe to carry the burned gases while in operation and, at the same time, cool the

| G | 4 | 40 | Aug. 15–Sept. 14 | 218 | 7.3 |

water when not in operation by cold air being drawn through the coils because of the vent pipe. This may be partially controlled. Suppose, however, that gas sells for $1.50 per 1,000 cu.ft. and has a heating value of 500 B.t.u. per cubic foot. Assuming a thermal efficiency of 50 per cent, 3,400 B.t.u. (1 kw.-hr.) will cost 2.1 cents. Suppose again that the gas heater is of better design and is 75 per cent efficient. In this case 3,400 B.t.u. will cost 1.3 cents. Or, take oil, having a heating value of 140,000 B.t.u. per gallon at 50 per cent efficiency and at 10 cents per gallon, 3,400 B.t.u. will cost 0.5 cent. The difference is, of course, much more marked in this case, but when one considers the almost insignificant number of oil heaters in gas districts the competition from this source is also negligible.

About 833 B.t.u. are necessary to raise the temperature of one gallon of water 100 deg. F., which means slightly more than 4 gal. per kilowatt-hour. At 50 gal. per day the kilowatt-hours per month will be about 400, exclusive of any radiation losses. Unless the rate is lower than 2 cents, the cost will be greater than the majority of people will care to pay, especially when the cost of electrical equipment exceeds that of gas-operated apparatus, as it usually does.

The total cost to the customer, however, includes the initial cost of the equipment. What can be reasonably invested in a storage tank will, of course, depend upon two factors: (1) How many gallons of water will the customer use per month, and (2) what rate must he pay for electrical energy?

The cost to the utility can likewise be segregated into (1) fixed costs, due to increase in local and general investment, and (2) variable costs, depending upon the amount of hot water used.

It is at once apparent that these two parties to the transaction are in opposition. For example, from the central station viewpoint the most desirable water heating load would be during the valleys of the load curve. This would necessitate (1) a large storage tank and (2) clock-switching mechanism or the equivalent. An electric heater of large capacity would require the smallest tank and no clock mechanism. It would, however, require additional investment in transformer and generator capacity and in wires. The question to be decided, then, is: What size heater and tank is the most economical for the customer, since he is the one who pays the cost ultimately.

## Cost to the Utility

Assuming that all equipment inside the customer's dwelling, except the meter, is paid for by him and all other cost is paid for by the utility, an attempt will be made to discover what size heater and tank is the cheapest, all things considered.

The assumption will be: (1) 50 gal. of hot water per day; (2) water heated from 50 deg. to 150 deg.; (3) each residence equipped with an electric range; (4) a peak load of a group of range-equipped residences to occur between 5 and 6 p.m., and to total 1 kw.; (5) an insignificant residential load between 12 midnight and 6 a.m.

## Comparison of Methods

The first method (designated as method No. 1) considered is the supplying of sufficient kilowatt-hours between midnight and 6 a.m. to heat 50 gal. of water 100 deg. and to supply radiation losses. This means heating the water to a somewhat higher temperature than 150 deg., since the temperature will constantly fall during the other eighteen hours due to radiation losses to the air and the cooling effect of the incoming cold water.

The cold water will, of course, enter the bottom of the tank and hot water will be drawn off at the top. Turbulence of incoming cold water as well as heat con-

TABLE III—VARIATION IN DEMAND AND COST TO SUPPLY 200 TO 1,200-WATT HEATERS

* Assumes necessary killowatt-hours supplied during eighteen hours of the day.

duction will cause a considerable lowering of the temperature. There will be very little convection currents, since the hot water is already at the highest point. To keep the conduction from the top 50 gal. as small as possible, an additional 25 gal. of capacity should be provided. This means a 75-gal. tank. Radiation losses for a well-insulated tank of this size will be about 75 watts and for a poorly insulated tank three times this amount and more. The kilowatt-hours to be supplied per day will then be 12.5 for raising the temperature of the water and about 2.5 for radiation losses, making a total of 15 per six hours, or 2.5 kw. capacity. Since the demand of a group of residences was assumed to be 1 kw., the peak demand will now be 2.5 and will occur between midnight and 6 a.m. While this may be of no consequence to companies having a large power load in the daytime, it may be to companies having a large portion of their load residential. Considering the residential business by itself, 1.5 kw. of additional capacity must be provided or set aside for water heating. At $200 per kilowatt, this means an investment of $300 on the part of the company. The customer will have an investment of approximately $250, including tank, clock-switching mechanism and the installation of the same. The total cost of the service will then be 1 per cent of $550 monthly, or $5.50 plus 450 kw.-hr., at an assumed cost of 1 cent per kilowatt-hour, or $4.50, making a total cost of $10 per month.

### Two-Heater and Relay Combinations

The second method will be designated as the two-heater method, which was described previously and which consists essentially of the following: A heater of small wattage, on continuously except when disconnected by a thermostat when all water in the tank is at 150 deg., and a manually operated auxiliary heater of 3-kw. size, also disconnected by a thermostat when the entire contents of the tank are at 150 deg.

In Table III is shown the variation in cost with small heaters varying from 200 to 1,200 watts, assuming the water to be used by a group so that no peaks will result. This is not the case, however. Each residence will use hot water for dishwashing after mealtimes, so that the majority of small heaters will be on the line at that time. The heaters of 700 watts and larger will, therefore, cause a demand greater than 0.6 kw., as shown in Table III.

This feature, however, can be eliminated to a certain extent by a contrivance which would not turn on the heater until 10 gal. or so of hot water is withdrawn from the full tank and which would not turn off the heater until the entire contents of the tank are heated. By placing the small heater, say, one-third the length of tank from the bottom, inserting the thermostat about 1 in. below the heater and providing a plate or pipe is inserted so the water heated will immediately rise to the top of the tank, that is, circulate, this feature can be accomplished. This is shown in Fig. 2.

The third method is a modification of method No. 1 and consists in permitting the heater to be connected a greater number of hours per day. By placing a relay in the range circuit which will operate when one element of the range is in use it can be made to disconnect the water heater when the range load is, for example, 1,000 watts or more. Load curves of residence districts equipped with electric ranges will show the peak to occur between 5 and 6 p.m. (see Fig. 3). A relay such as this would then keep the peak caused by water heaters down to a very low amount per heater. If the relay were set to operate at 500 watts the peak would not be increased as much. There is one point which must not be overlooked at this time, and this is that a considerable amount of water for dishwashing at the present time is heated on the electric range. A water heater will, therefore, take this range load away from the range and give it to the heater. Assume that the large element of the stove, say 1,500 watts, is used for heating water for dishwashing and the water heating element is only 1,000 watts, there is a direct reduction of 500 watts. This reasoning leads one to believe that a contrivance which will disconnect the water heater when the range is in use will probably lower the peak caused by ranges; at least it will not increase it.

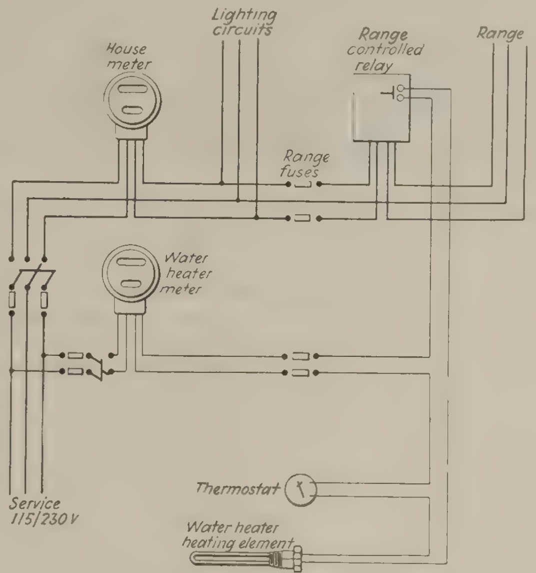

FIG. 8—SWITCHING CONNECTIONS FOR METERING AND CONTROLLING ELECTRIC WATER HEATERS

Referring to the tank shown in Fig. 2, it may be well to mention that experiments made on tanks with the heater located inside of a metal pipe, which is in turn located in the center of the tank, show very little circulation with a 1,000-watt heater. This is due possibly to the condition whereby the metal pipe conducts the heat to the surrounding water so fast that there is no tendency toward circulation. When a 3,000-watt heater was used the water circulated, showing that the conduction of heat was too slow to keep the temperature of the water in the inside pipe from rising. The inside pipe or vane must, therefore, be constructed of other material, something which will conduct heat very poorly, if a 1,000-watt heater is to be used. No experiments along this line have as yet been made by the writers, but the advantage of this scheme appears to be of sufficient importance to warrant experiments.

### Load Characteristics

The reason for assigning importance to this feature is apparent by referring to the daily load curve of a district equipped with ranges. The demand of this group of residences rises rapidly at 4 p.m., reaches a peak at 5:30 and then drops to its former value at about 8 p.m. With a relay in each range circuit to disconnect the water heater when 1,000 watts of range capacity is in use the residence demand between 4 and 8 p.m. may increase, due to the water heaters. Although the heater in any one residence may be disconnected, nevertheless the range in the residence next door may not be in use and its water heater may be on, resulting in 1,000 watts more in demand than would obtain if no water heaters were installed. By imposing the condition that 10 gal. or more of water must be withdrawn from a tank completely filled with hot water before the heater will again be turned on, the chances of an increase in demand becomes extremely remote. The range relay will then accomplish what a clock-switching mechanism would and at much less expense.

### VALUE OF RANGE RELAY

Such a scheme immediately eliminates any demand charge. The only expense is the manufacturing cost of the energy, together with the copper losses between the power house and the heater. Since this cost is in the neighborhood of 0.5 cent per kilowatt-hour for large plants, a rate of 1.5 cents less 5 per cent leaves a very good margin.

The wiring diagram for the above method is shown in Fig. 8. Assuming twenty hours per day, this method will supply 600 kw.-hr. per month. A tank sufficient to take care of peak requirements must be provided. Opponents to this scheme may ask why not use a small tank with a large heater (3 kw. or more), manually operated. This can be done, but it must be remembered that under the manually operated system a demand charge must be made against the water heater. The heater demands will occur between 6 a.m. and 12 p.m. with the manually operated, whereas with the automatic small heater with the large tank a goodly portion will be sold by the utility between midnight and 6 a.m., a highly desirable feature.

Customers should still be given the privilege of installing a large heater, energy for which is to be measured on house lighting and range meter and, hence, pay a higher rate. Some customers may prefer to do this. In general, however, the extra expense of installing a large heater as an auxiliary, together with the necessary heavy wiring and switches, is far more than the additional cost of a large storage tank, to say nothing of the added inconvenience and extra charge for energy necessary.

### WATER HEATING AN ATTRACTIVE LOAD

For the sake of argument, assume that a 3-kw. manually operated heater will use only 300 kw.-hr. per month. A company would be obliged to charge between 2½ and 3 cents per kilowatt-hour for this energy. This would cost the customer from $7.50 to $9 per month. Then assume a 1-kw. heater operated in conjunction with a "peak-limiting" relay. The radiation loss of 50 kw.-hr. would be supplied in addition to the 300, making 350. At a low rate of 1.5 cents per kilowatt-hour, the cost for energy would be $5.25, which is $2.25 to $3.75 per month less. Assuming a use of only six months during the year gives $20 approximately, which is very good interest on $100 additional investment.

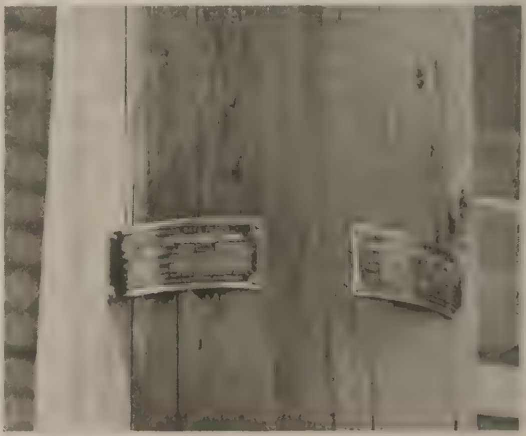
When a customer desires to use a tank having a heating coil in the house furnace the electric heater should be placed in series with the furnace tank, the hot water outlet pipe of the furnace tank entering the electric tank at the bottom, as shown in Fig. 1. When the water is not sufficiently heated by the furnace coils the electric heater will operate. The customer will thus be assured of hot water of about the same temperature all year around and the company will have no worry about demands caused by the water heaters in those cases where the winter load is larger than the summer.

There will be cases arising where the 1,000-watt heater will not be large enough on the average, which can be ascertained by noting the amount of energy used by the heater. In such cases the size of the heater can be increased and an extra charge per kilowatt per month made. In case the complaint is due to an abnormal use at some particular time, the size of the tank can be increased. This can be ascertained by noting the kilowatt-hours consumed.

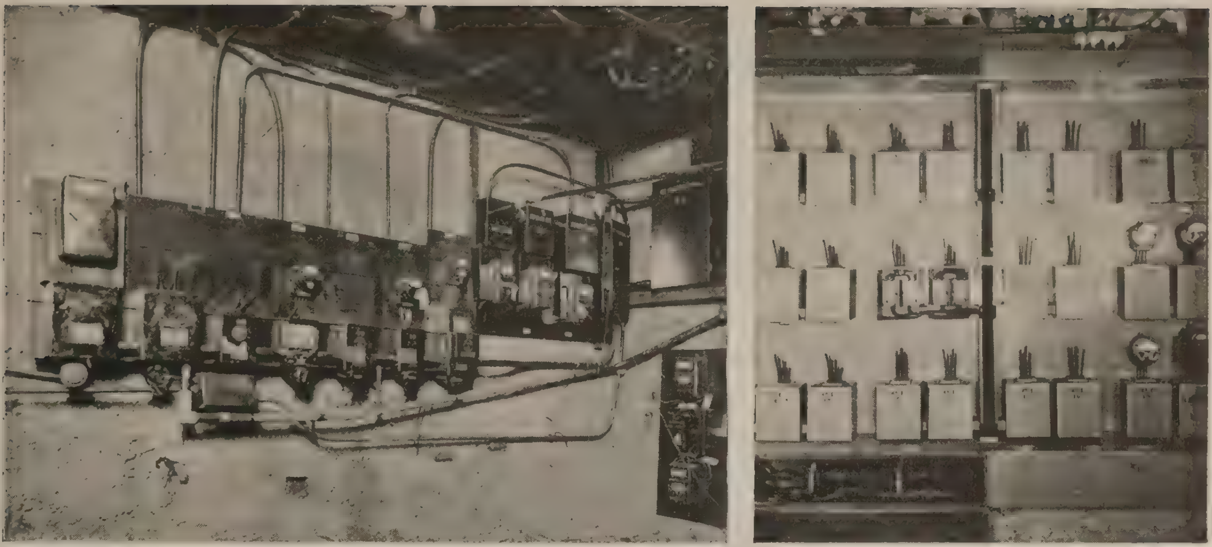
Referring again to Fig. 3, which is the load curve of a district having about 85 residences, with ranges in 75 of them, and assuming, also, 75 water heaters of 1,000 watts each, the demand between 6 a.m. and 4 p.m. will not be increased to more than 150 kw., the peak at 5:30 p.m. Since the water heaters will not be on at 5:30, there will be no increase in peak of the district due to the heaters.

In time to come, when the average use per residence becomes more than 1,500 kw.-hr. per year, it may be desirable to increase the size of the heater from 1 to 5 kw. All secondary distribution lines will have been increased to take care of the heavy demand for energy under such great use, and the diversity of the water heaters will cause little increase in station demand. The supplying of energy to a small heater during the night hours is especially attractive and, for that reason, is being tried out at this time.

## Transformer Data Plate Placed on Pole



TO facilitate field checking of transformer capacities, voltage rating and serial numbers and to aid in distribution of load and laying out of extensions, the Southern Sierras Power Company, Riverside, Cal., places transformer data plates on transformer poles as shown in the accompanying illustration. The plates are stamped by the company to indicate manufacturer, rating, serial number, type, phases and high- and low-tension rating. The blank plates cost 8 cents each and it is estimated that the total cost stamped and installed will not exceed 25 cents each. The Southern California Edison Company uses a similar plate for pole-type oil circuit breakers as well as for distribution transformers.



*Old and new type of underground service and meter installation in Portland*

Wire runways with removable covers replaced nipples, adding to the appearance and flexibility of the installation without increasing the cost

# Iron-Clad Services Protect Against Theft

By S. B. Clark

*Superintendent Underground Northwestern Electric Company, Portland, Ore.*

FOR a number of years the Northwestern Electric Company, Portland, Ore., has followed the practice of making an "iron-clad" type of underground service and grouped meter installation, primarily to protect against current theft, but also for convenience and economy in reading and testing meters.

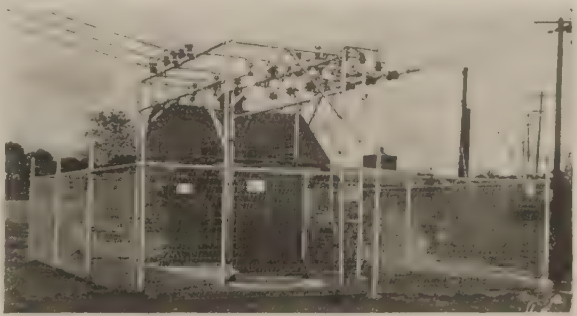
Earlier installations were of the type shown in the left-hand view in the accompanying illustrations. This consisted of standard steel cabinets connected with pipe nipples. Service cables from the street enter the large cabinet containing the mail line switch shown at the upper right-hand side of the illustration. Rubber-covered wires were carried from one meter position to the next through the pipe nipples. Taps were taken off for each meter and fuses of proper size were provided for the several tenants. This type of construction became very inflexible as time passed when a new tenant with greater current requirements occupied an old location with small fuses. While the feeders from the main line switch are installed with capacity to care for a 50 per cent increase in load, frequently it was found less expensive to abandon the old meter position, with consequent additional expense to the serving company in changing the customer's feed wires, rather than attempt to increase the size of the box to take larger fuses.

These objections have been overcome in the newer type of installation, shown in the right-hand illustration. Here each position will accommodate a load varying from 50 watts to 50 kw., with a maximum cost for the change not to exceed $10. Open 240-volt copper buses are supported on transite blocks in the large horizontal gutter at the bottom. Holes are drilled in the buses for the maximum number of positions the board will care for. Cabinet covers and wire-ways are removable. The nipples between boxes in the old type installation are replaced with short square wire-ways with snap-on covers and are bonded to the boxes with stove bolts. In wiring this type of installation measurements of wires can be taken, lugs sweated on and all wires then laid in place, after which the covers are placed on. Feed wires to the various customers are usually passed from the meters through the vertical wire-ways to a collecting gutter at the top of the board which contains a neutral bus.

Material for this type of installation is more expensive than the old, but the total cost is less, due to a reduction in the unit labor cost per meter from $5.50 to $2.50. Moreover, the new type requires only 2.75 sq.ft. per meter, as against 4.3 sq.ft. for the old, which is an item of importance where space is valuable. In the newer type of construction a make of fused test block is used which permits meters to be tested without interrupting service.

---

# Simplicity a Feature of 13,000-Volt Outdoor Substation



THE 13,000-VOLT outdoor Brookhaven (Miss.) substation of the Mississippi Power & Light Company is constructed largely of 2½-in. galvanized-iron pipe. Space requirements have been minimized without sacrifice of clearance or working space and construction economies have been realized. Transformation is from 13,000 to 2,300 volts

# Reducing Distribution Losses

EIGHTH ARTICLE

## *Graphic Voltmeter Tests*

By J. B. Moorhouse

*Electric Distribution Engineer Central Illinois Public Service Company, Springfield, Ill.*

A COMPLETE voltage survey of an electric distribution system of a town or city requires the use of graphic voltmeters which must be placed on all primary phases at the source of energy supply. By keeping these instruments running throughout the test a check of regulation of the supply voltage is obtained. Furthermore, these charts are necessary in order to determine primary voltage drop at any time during the test.

Our graphic voltmeters are set at the ends of secondaries farthest from the transformers, at points of heaviest load and at points where voltage complaints have been turned in. To separate secondary loss of voltage from primary it is necessary also to set a voltmeter at the terminals of the transformer which supplies the secondary system under test. To avoid setting a voltmeter at each transformer under test two or more voltmeters may be set at points of heaviest loading, connecting them to the primary lines through potential transformers. By keeping these instruments running throughout the test an appreciable amount of time may be saved. Also, a smaller number of voltmeters is required when using this method.

GRAPHIC VOLTMETERS INSTALLED IN PORTABLE METAL CASE ON POLE

Charts are taken at different seasons of the year and for different lengths of time, depending on the nature of the load and the amount of information required. For example, a voltage check in a business district must always include the Saturday night lighting load. Voltage complaints caused by excessive range and appliance load connected to lighting secondaries are not likely to occur during the summer months, even though the cooking load is heaviest at that time. Much reconstruction work can be laid out with the guidance of voltmeter charts. The checking of new and rebuilt distribution facilities with graphic instruments furnishes an excellent record for future reference in case trouble arises on these systems.

The accompanying illustration shows a steel test box containing two type "U" graphic voltmeters connected so as to record the voltage on each leg of a transformer secondary. The box is securely and easily fastened to the pole by a chain which is wrapped completely around the pole. It is mounted low enough to permit access from the ground for attending the instruments. The box is weatherproof and has a fairly tight door. Sufficient heat is given off by the instrument resistors to prevent the clocks from stopping due to cold weather. Connection may be easily made to the overhead secondary circuits by employing a four-conductor cable fitted with clamps, which may be attached to the wires.

# Safeguarding Operators of Mercury-Vapor Turbine Units

By T. H. Soren

*Vice-President Hartford (Conn.) Electric Light Company*

THE Hartford Electric Light Company is at present installing in its South Meadow generating station one 10,000-kw. mercury boiler and turbine. The pioneer installation made by this company at its Dutch Point station had a capacity of about 1,800 kw. and its operation was highly satisfactory and economical. We obtained from this all the necessary information and experience to warrant the installation of a larger unit and we have abandoned the operation of the small unit. The new unit will give 10,000 kw. from the mercury vapor and in addition approximately 125,000 lb. of steam per hour at 260 lb. pressure superheated to a temperature of 700 deg. F.

Many inquiries have been made regarding the safety of this process. No chronic cases of mercury poisoning (due to continuous absorption of small amounts of mercury into the system) have occurred because the room in which the turbine was installed was well ventilated. A few acute cases of poisoning resulted from men entering the condenser when it was hot and thus being subjected to mercury vapor from leakage or other causes. Both possibilities have been eliminated by the design and construction features involved in the new installation.

None of the cases of poisoning we had in the pioneer installation was serious and the men recovered within a very short time with fresh air and a little outdoor exercise.

The walls of the building will be hard-finished surfaces, so that in case of leakage any mercury can be flushed down with water. All hot parts of the mercury turbine and piping will be inclosed with light sheet iron and wire glass openings for inspection and a slight suction will be maintained from the inclosure to the stack. Any leakage will thus be drawn up the stack and will not enter the operating room.

During extensive repairs or inspection, there is liable to be a certain amount of mercury spilled or opened to the atmosphere, and under such conditions our operators or mechanics are expected to wear masks. If work is to be done requiring heat, such as welding or expansion of wheels by gas flame, it is necessary for the operators to wear masks.

The General Electric Company has developed a paper which is very sensitive to mercury. This is placed in different parts of the room and will indicate the presence of extremely small amounts of mercury in the atmosphere. A strip of this paper is also maintained in steady contact with continuous flue gas samples to indicate any leakage in any part of the system.

We expect to have the installation in operation within a few months and at that time many details of the installation will be available for publication. The economies will also be published when determined by operation.

# Super-Excited Condensers

### Three 30,000-kva. units at Plymouth Meeting substation of Philadelphia Electric Company regulate receiver-end voltage of 220-kv. line and also increase its power limit during short circuits

By O. A. Gustafson
*General Electric Company*

IN LINE with the present increasing interest surrounding transmission and system stability, an interesting synchronous condenser installation has recently been undertaken, wherein the condensers are to be equipped with a special excitation scheme designed to permit their maximum utilization in raising the transmission system power limit during short-circuit disturbances.

Three 30,000-kva. synchronous condensers are to be installed for the Philadelphia Electric Company at its Plymouth Meeting substation, the receiver end of the 220-kv. transmission line from the new Conowingo hydro development.

The requirements for normal voltage regulation by power-factor control will call upon these condensers to operate at only one-third load, but the excitation system is designed to increase this output to approximately twice normal in one-half second whenever system disturbances demand a sudden and large increase in leading kva.

To obtain the results, an excitation system of unusual effectiveness is required, so much so that, as a matter of distinction, the term "super-excitation" has been used in designating such class of excitation.

The following discussion will cover in some detail the component parts of the equipment with their design limits and operating characteristics, along with a short description of a pertinent test, conducted to indicate in miniature what is expected of the total equipment of the 30,000-kva. condensers.

### Equipment Used on Condensers

The synchronous condensers are rated 30,000 kva., 600 r.p.m., 13,800 volts, and are horizontal units of standard design. The excitation equipment connected to each consists primarily of:

(a) *A main exciter,* direct-connected to one end of the condenser shaft, eight poles, compound wound, with a nominal rating of 165 kw. at 250 volts.

(b) *A sub-exciter,* direct-connected to the other end of the condenser shaft, six poles, compound wound, with a continuous rating of 40 kw. at 250 volts.

(c) *An alternating-current voltage* regulator for the main exciter.

The maximum momentary output of the synchronous condensers was fixed at 55,000 kva. as, due to saturation present in a normal machine, additional output above this value could be obtained only by an impractical and uneconomical amount of field current. Therefore, the maximum load current of the main exciter will be determined by the condenser field current corresponding to 55,000 kva. The maximum working range or "ceiling" voltage was chosen to be approximately 1,000 as a reasonable compromise between the desirability of putting the increased excitation on the condenser as quickly as possible and the proper appreciation of what momentary maximum voltages should be applied to standard 250-volt synchronous-condenser field insulation. It will be seen from the calculated saturation curve (Fig. 1) of the main exciter, however, that this "ceiling" of approximately 1,000 volts is not the saturation limit of the machine. This maximum allowable voltage is established by means of a resistance in the main exciter field, which, in conjunction with the working voltage on the sub-exciter, will just give the required "ceiling" voltage. This resistance, therefore, also fixes the maximum current demand on the sub-exciter.

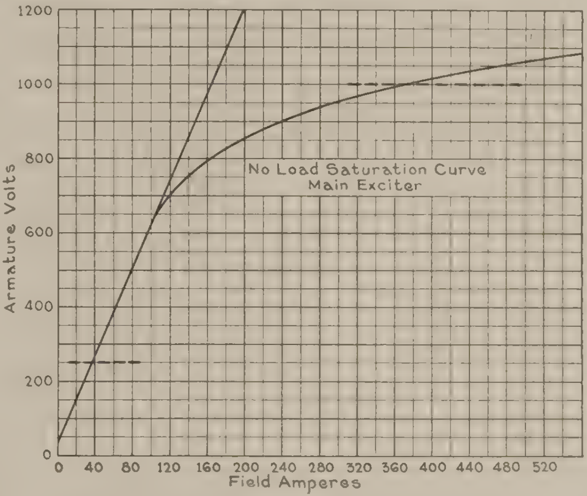

FIG. 1—NO-LOAD SATURATION CURVE FOR 165-KW., 250-VOLT EXCITER

Thus, the main exciter will be called upon to commutate momentarily the field current required by the condenser for an output of 55,000 kva., and this current must be commutated at the "ceiling" voltage of approximately 1,000 volts. The voltage of the sub-exciter is held at approximately 250 volts, thus assuring a constant source of voltage for producing the excitation in the field of the main exciter.

If the transmission system suffers a disturbance, causing a major drop in voltage on the high-voltage side of the transformer to which the condenser is connected, the voltage regulator causes the exciter voltage to rise to its ceiling value, at a rate of 6,000 to 7,000 volts per second. This rate of rise, though extraordinary, is in line with the other general design characteristics of super-excitation. This ceiling value of nearly four times normal voltage immediately forces the condenser field current and armature current above the short-circuit values at a very rapid rate. If system conditions demand it, the regulator will permit the condenser field current to rise to its maximum allowable value, which will result in an output of 55,000 kva., assuming normal voltage.

### Momentary Output Adjusted by Excitation

It should be appreciated that this maximum momentary output may be decreased to any value desired by adjustment of excitation equipment, if system conditions indicate that a 55,000 kva. upper limit is not necessary.

When the major system disturbance subsides, the regulator causes the exciter voltage to drop to any value commensurate with the condenser load requirements following the disturbance. This completes the cycle; the condenser has given the system its assistance and is now ready to resume normal operation.

The advance outlined in the art of providing fast excitation is the result of much extensive calculation and experimentation on the part of the General Electric Company. A program of tests made in this connection, with miniature apparatus, so accurately parallels the situation expected on this transmission system that it seems justifiable to make some detail reference to it here. A 100-kva., four-pole, 1,800-r.p.m. synchronous condenser was connected to a 5,000 kva. source of power as an approximation of the relation between the 30,000 kva. condensers and the system to which they are to be connected. The field of the condenser was adjusted to give approximately one-third leading current to correspond to the expected normal operating load of the 30,000-kva. condensers. In the test room there was available 550 volts direct current, which was approximately seven times the field voltage necessary to obtain one-third leading current. This voltage of 550 was then suddenly applied to the small condenser field and oscillograms of stator amperes and volts, and field amperes were taken to show what happened.

The rate of rise of stator amperes, as evidenced by the swing of the ammeter needle, was impressive. In spite of the natural lag in the instrument, its needle traveled the meter scale with remarkable speed.

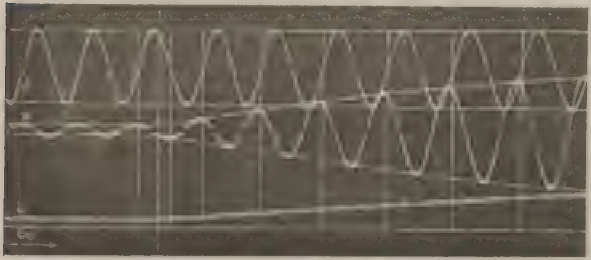

FIG. 2—OSCILLOGRAM OF TEST ON 100-KVA. SYNCHRONOUS CONDENSER WHICH IS INDICATIVE OF RESULTS EXPECTED ON THE 30,000-KVA. MACHINES

A—60-cycle terminal voltage
B—Stator current
C—Field current
$C_0$—Zero line of field current

Fig. 2 shows the resulting oscillogram. The point where the 550 volts was applied is clearly evident in the oscillograms of the field current. Fig. 3 shows curves plotted from data taken from Fig. 2, which are self-explanatory and indicate clearly the very high speeds obtained. Calculations made on the test machine check very closely with the results of the test. It is evident that the rate of increase of kilovolt-ampere obtained in the above machine is much higher than expected in the very much larger 30,000-kva. condensers under discussion, but after correcting for the difference in design constants which affect the calculations, the results expected from the 30,000-kva. synchronous condensers are entirely in line with the test results obtained on the small machine.

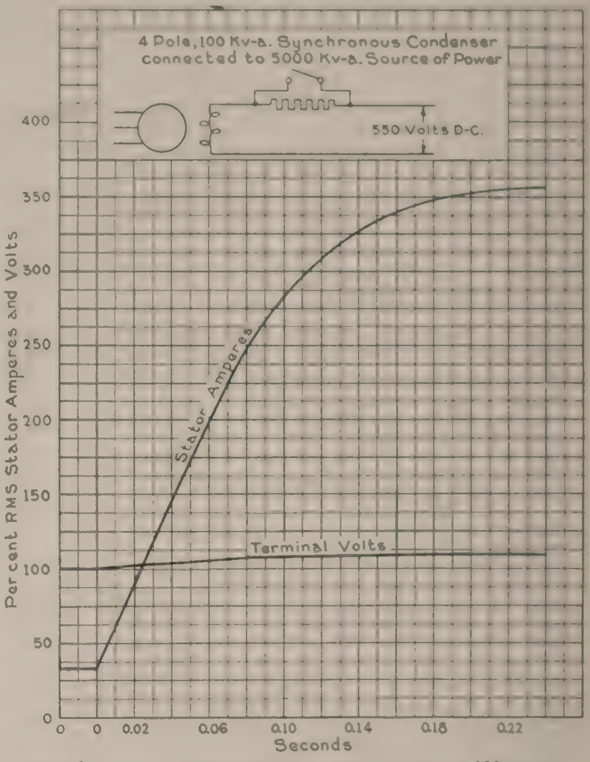

FIG. 3—PLOT OF CONDITIONS OBTAINED IN TEST OF 100-KVA. SYNCHRONOUS CONDENSER, CALCULATED FROM THE OSCILLOGRAM SHOWN IN FIG. 2

A word of caution might well be injected into the discussion as the evident remarkable increase in kilovolt-ampere might indicate the desirability of always providing super-excitation on synchronous condensers. It must be remembered that fast excitation is only one of many ways of increasing stability and is by no means to be considered a cure-all. Unless applied with judgment and full knowledge of all factors involved, it may have harmful potentialities, which increase with the degree of excitation speed considered.

## 55 Per Cent of Belgian Homes Served Electrically

According to the result of a recent survey reported by the Belgian Union for Electrical Development it appears that about 55 per cent of the homes in Belgium have an electrical service connection. This is a material increase over the percentage reported in *Commerce Reports* of Dec. 6, 1926, and subsequently quoted in the Electrical World. The date to which the earlier figure applies is not reported; the difference presumably represents several years' growth.

# Beauty and Utility in Hydro Plants

## By harmonizing generating stations with adjacent summer resort property objections thereto were avoided

By H. W. Gochnauer
*General Manager Northern Electric Company of Wisconsin, Green Bay, Wis.*

THE Northern Electric Company of Wisconsin has completed a hydro-electric plant on the Menominee River at Chalk Hill, Wis., which is somewhat individualistic in appearance, although its layout does not deviate in general from the stock power house.

Two beautiful lakes will be formed by the developments. The shores are mostly high and rugged, fronted by deep water with many interesting bays, fingers and islands. Pines, firs, birches, aspens and oaks produce wonderful changing color effects throughout the summer, bringing the season to a kaleidoscopic climax in the fall with a riotous brush.

The Northern Electric Company, realizing the high value of this lake-shore property, expects this year to place estates for summer homes on the market. In keeping with this project, careful thought was given to the external and internal design of the power houses. An endeavor was made to make them jewels in the wooded landscape, rather than commercial buildings.

The Chalk Hill plant is built of tapestry face brick of dark red and brown shades with a dark raked joint. A precast light yellow-brown trim stone is used for belt courses and copings, which, with the massive columns, give the structure a solid appearance in harmony with the solidity of the concrete substructure. The high, triple Gothic arch windows are glazed with lead-stained glass. The borders and tops of each window panel are composed of rather deep blues, greens and ambers in squares, triangles and rectangles, and the center section is of amber glass, graded upward from a very light to a rather dark shade.

The interior walls are built of salt-glazed brick of a light straw color. The tile floor is of darker shades, containing rich browns, reds and blues. Borders of square tile are laid around the outer walls and around the generators. The generators, governors and ornamental wrought-iron railings are painted a light blue, harmonizing with the blue in the windows. The machinery and rails are trimmed with a light yellow, conforming in shade with the brick side walls. Cathedral lights of cast bronze, supported on wrought-iron brackets, adorn the side walls.

Nearing completion at the White Rapids plant is a similar plant which will, however, surpass in beauty the one at Chalk Hill. The favorable comments on the project received from visitors are most gratifying, and the most pleasing fact is that only a slight additional expenditure was made to produce the general effects desired.

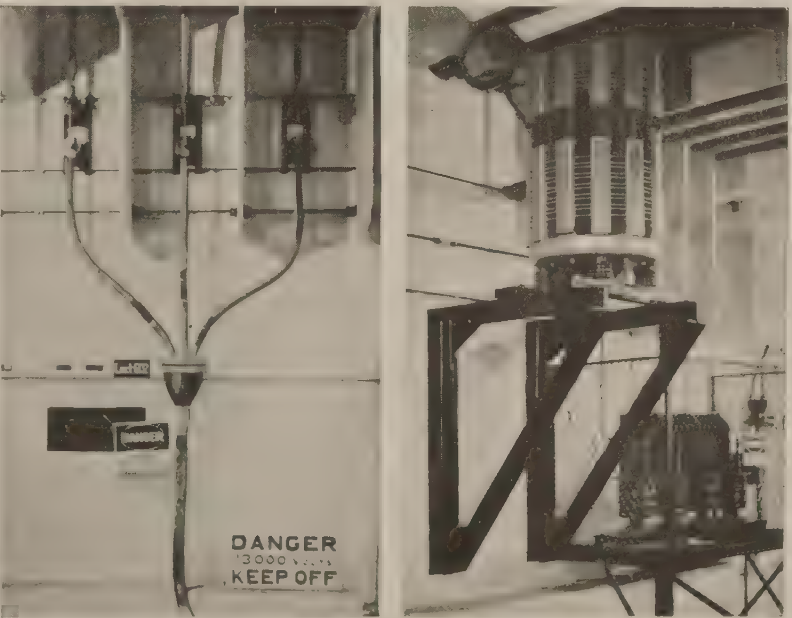
The installation at Chalk Hill comprises a dam of eleven 12x24-ft. Tainter gates and a power house containing three vertical units. Both generators and turbines were furnished by the Allis-Chalmers Manufacturing Company and the switchboard and transformers by the General Electric Company. Nagler adjustable-blade runners, permitting flexibility of operation with various quantities of water, are connected to 3,250-kva. generators. The total capacity of the plant is about 11,500 hp., with a 28-ft. head.

The White Rapids plant will be very similar, excepting that a 29-ft. head is available and the dam consists of nine Tainter gates, 14x24 ft. The wheels at White Rapids are Francis type vertical turbines furnished by the S. Morgan Smith Company, and the generators are furnished by the General Electric Company. In this installation, two 3,750-kva. and one 2,500-kva. generators at 100 and 120 r.p.m. are being installed. The two sizes are being used to provide flexibility for various quantities of water. Due to the facts that the heads are practically the same and that each plant will receive the same amount of water, it will be interesting to compare the amount of power produced by the two types of water turbines.

Views of one station were published on page 1028 of the Nov. 19, 1927, issue of ELECTRICAL WORLD.

# Flexibility of Arrangement and Operating Safety

OPERATING safety is afforded in the No. 6 substation of the United Electric Light Company, Springfield, Mass., by mounting reactors on steel brackets and installing cable-disconnecting switches out of ordinary reach from the floor. Apparatus near the level of operators' bodies is screened against chance contacts. By the use of channeled slots in the concrete wall the spacing and arrangement of switch bases and barriers may be varied to meet local conditions and service requirements.



CABLE DISCONNECTS AT SAFE DISTANCE FROM FLOOR; REACTOR ELEVATED ON BRACKETS, AND APPARATUS BELOW IS SCREENED

*Magnetic across-the-line starters with push-button control*

Left—Iron-clad service switches are connected with the magnetic starters by adapters for 900-hp. supersynchronous motors.

Center—These solenoid-operated feeder breakers automatically protect the magnetic across-the-line starters on short circuits.

Right—Magnetic across-the-line starters for 2,300-volt high-torque motors ranging from 20 to 100 hp.

# Push-Button Across-Line Starters in Cement Mill

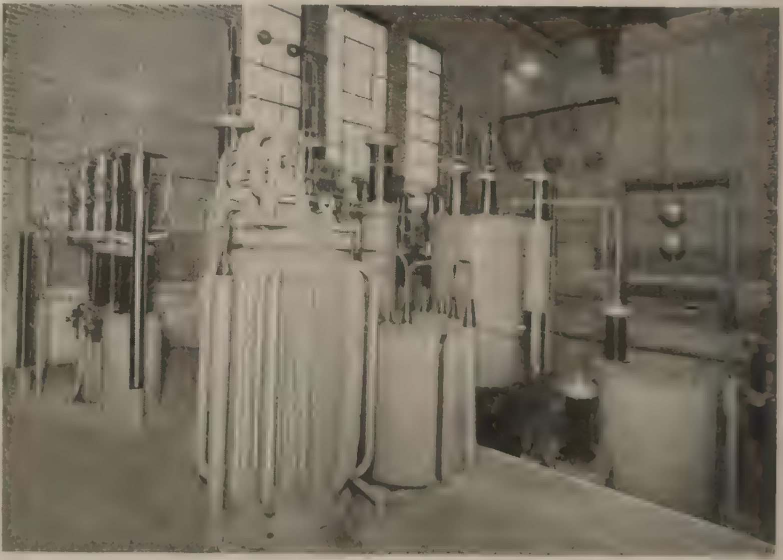
By I. T. Hockaday
*General Electric Company, Houston, Tex.*

With the exception of the motors in the machine shop, all the motors in the new plant of the Trinity Portland Cement Company, Houston, Tex., are controlled by across-the-line starters. The motors which are involved range from two 900-hp., super-synchronous down to $\frac{1}{2}$-hp. sizes. The super-synchronous motors have automatic across-the-line push-button control, the push button being located near the motor and the control apparatus in the basement. The induction motors, ranging in size from 100 hp. down, are controlled by push buttons located near the motors and magnetic starting switches in the basement. Because of limited space, it was found necessary to place the switching equipment in a separate room and the basement was found to be the logical location.

Since the magnetic starting switches used have a comparatively low interrupting capacity and are controlled by temperature overload relays, short-circuit protection was given serious consideration. The motor bus runs from the switchboard to the bus on a pipe framework in the basement on which the starting switches are mounted, and from the latter bus several motors are fed. There being no oil circuit breakers between the bus and the starting switch, relays are used for short-circuit protection. The contact points on these relays are connected in series with the low-voltage device of the oil circuit breaker on the main switchboard. Thus, in case of short circuit, the relay involved will open the oil circuit breaker on the feeder involved. All relays have a hand-resetting device.

To feed the kiln, adjustable-speed, alternating-current motors with shunt characteristics are used, the motors being located at the feed end of the kiln far from the kiln operator. Push-button stations are situated so the chemist can control the feed of the kiln. The rate of feed into the kiln is determined from tachometers connected with each motor.

# High-Tension Test Set for 132-Kv. Cable



To test 12-mile, 132,000-volt underground cable between the Hell Gate generating station and the Dunwoodie substation the New York Edison-United Companies utilize the 400,000-volt kenotron testing outfit shown.

# Sinking-Fund Accumulation

### Effects of long-lived items. Errors in average lives caused by compound interest affect rates of interest. Lives must be estimated within careful limits

By W. G. Cross

*Assistant Valuation Engineer Southern California Edison Company, Los Angeles, Calif.*

MANY depreciation reserves are set up on the life-table basis under the sinking-fund method. The theory of this procedure is that the cost of a major article of plant belonging to a utility and wearing out in the service of the public should be reimbursed at the end of the life of the article. Under the conditions where the sinking-fund method is considered applicable, there is set aside an annuity each year, which is assumed to draw interest while remaining in the reserve. At the end of the term of years originally estimated as comprising the life of the article these annuities, through the effect of compound interest at a certain specified rate, will produce in the depreciation reserve the amount of money necessary to so reimburse the utility. Theoretically, the life used for each article is the estimate of the actual term of years during which the article will function properly and, if there were no functional depreciation, would be the life sustained until wearing-out processes, such as decay, attrition, depletion, etc., had stopped its further usefulness. Entering of functional depreciation shortens the expectant life and the lives used, therefore, are usually somewhat shorter than the natural life would be.

## Compound Interest Affects Accumulations

The case of articles which may be expected to have a long natural life, but which are subject to the exigencies of functional depreciation, has always presented a somewhat puzzling problem which is magnified under the sinking-fund method. The case of concrete or masonry diversion dams forming a portion of a hydro-electric project has been referred to already in previous articles. It is probable that the natural wearing life of many dams of this type will be very long. Records show the existence of certain bridges and highways constructed at the time of the Roman Empire, and it is most certainly true that some dams can be pointed to where the life has already been in excess of 100 years. Many dams now in existence have lived for a considerable period of time without showing any appreciable wear, and it is well within reason to assume that the concrete or masonry of which they are composed may continue to exist in place for a century or more. This does not, however, justify an infinite life for dams, nor can it be proved that possible functional depreciation shortens the life to 100 years, 50 years, 40 years or any exact term of years. It must be conceded that the life cannot be accurately predicted.

Still bearing in mind that depreciation annuities are being discussed on the life-table basis and that the sinking-fund method for future retirement is being considered, the author believes that such a method sets 40 to 50 years as the maximum life that logically can be assigned to any item of plant whatsoever and still stay within the limits of practicability. Compound interest produces an increase from an original sum of $1 to $10.29 in 40 years and to $339.30 in 100 years, at a 6 per cent rate. An amount of $1 set aside annually will produce $154.76 in 40 years and $5,638.37 in 100 years at 6 per cent. On the other side of the slate, if we desire to accumulate $1,000 at the end of two years, assuming 6 per cent interest, there will have to be set aside $485.44 annually. If the time period be taken as five years, the annuity will be $177.40; if 40 years, $6.46, and if 100 years, $0.18. The geometrical relationship of these figures should always be borne in mind. Referring to the annuity accumulation figures, we note that an annuity laid aside for a definite time, such as mentioned above, will grow to 37 times as much in 100 years as it will in 40 years. When setting the probable life of the dam, it is just as logical to estimate a 100-year life as a 50-year life, or vice versa, owing to the known uncertainty of what the future will bring. It may perhaps be difficult to define the point of departure and say that life predictions become vague after 40 years or after 50 years or, possibly, after twenty years, but the author herein attempts to show that beyond a certain point compound interest renders such predictions absurd.

## Predictions May Involve Large Error

In the case mentioned, if 40 years be estimated and if the item lives 100 years, an accumulation will theoretically have been made 37 times too great; if the life is estimated at 100 years and the article lives 40, the accumulation will be only one-thirty-seventh of what it should have been. In the former case, the utility will have been protected and can stop the accumulation when the full amount has been collected, but in the latter case there is practically no recourse available.

Looking at the annuity side of the picture, it is found that for a $1,000 dam the annuity would be only $0.18 under the assumption of a 100-year life. This is a little more than two one-hundredths of 1 per cent of the cost of the dam. Very practical difficulties exist with respect to the theoretical accumulation of compound interest on $0.18 annuities, and here is a case where theory has to give way to practical fact. Such an annuity is too low for this item when considered from the practical standpoint. The $0.18 annuity theoretically accumulates some $28 in 40 years instead of the $1,000, and no one can integrate the uncertainty of functional depreciation and say that the dam may not be superseded in 40 years. It would be better in this case, as far as the stability of the enterprise and its consequent serviceability to the public is concerned, to set aside $6.46 annually, rather than $0.18, on the $1,000 article, considering the balance of $6.28 annually as applicable to the stability of the utility. This insurance charge is less than two-thirds of 1 per cent on the investment and offsets the possibility of loss of thirty-six-thirty-sevenths of the investment, which is the amount of the risk involved under the conditions outlined.

From the practical point of view, therefore, it becomes evident that the uncertainty of life after 40 years leads to absurd results in accumulation, with possible disaster to a utility if the reserve is insufficient, while, on the other hand, the additional cost of the annuity to insure against such possible disastrous results is so small that it is well within the realms of ordinary business prudence to base all calculations on the lowered lives. The author believes that 40 years is the maximum life that should be assigned to any depreciable item of plant when considering sinking-fund annuities which are computed at an interest rate which is equal to or in excess of 4 per cent.

### Assigning Average Lives

A most interesting phase of annuity calculations on the sinking-fund basis relates to the average life assigned to groups of items. It is quite customary to assign lives to groups covered by primary capital accounts under which the utility operates. The accounts in question may be those of the Federal Power Commission, the classification of the board of utility commissioners or that required by state regulatory bodies, etc. The items in certain accounts appear to be described by their nomenclature. The account Dams and Reservoirs naturally calls to mind imperishable structures such as masses of concrete and masonry, together with large excavations in the ground. The account Poles and Fixtures leaves in the mind the idea of wood poles standing in the ground, while the account Conductors immediately brings up the picture of copper wire remaining in the air through many years. This natural tendency to judge the contents of an accounting segregation by the name of the account is responsible for a great deal of error in the accumulation of the annuities which we have described above.

In the first place, the account Dams and Reservoirs includes not only a large amount of money relating to concrete and masonry structures, as well as large excavations designed to store water, but also includes a certain smaller amount of money in gates, water-measuring devices, spillway apparatus, booms, screens and innumerable other items pertaining to different types of installations. Poles and Fixtures account includes not only poles but also guy wire, anchors, machine bolts, etc. Conductors account includes not only copper wire but also insulators, insulator hardware, iron wire and conductor clamps. In almost every case the smaller items are of lesser life than the main items for which the accounts are named. It is common practice to assume that the amount of money comprising the lesser items is so small that it cannot materially affect the reserve accumulation. This is a most erroneous assumption.

Taking, for example, the dam discussed previously, and assuming, for the sake of argument, an estimated life of 100 years, an annuity of $0.18 would theoretically be sufficient to produce the required amount at the right time. Let us assume, however, that the dam is a complex structure and consists of two portions which may be separately considered in replacements. One, the major portion, consists of the concrete mass in the structure, with an assumed life of 100 years; the other consists of steel gates, guides and bolts, with a life of five years. amounting to much less in cost than the concrete alluded to. An $0.18 annuity will take care of $1,000 worth of concrete having a 100-year life, but this same annuity laid aside to cover steel gates and bolts which are replaced at the end of five years will cover only $1 of original cost. In a case such as this an amount of short life equipment of the nature of one-tenth of 1 per cent of the remaining long life equipment will modify the annuity materially.

The above example is somewhat extreme, but it is very logical to have situations which may be typified by an account covering both steel penstocks with a 40-year life and recording devices with a ten-year life. Mathematical calculation will show that 8 per cent of ten-year life equipment will require the same annuity as 100 per cent of 40-year life equipment. In a property comprising 8 per cent of ten-year life equipment and the remaining 92 per cent of 40-year life, the annuity, if calculated on the 40-year life, would be slightly over 50 per cent of what it should correctly be. Very careful consideration should be given to this fact when setting up sinking-fund annuities, for the above calculations make clear that a minor amount of short life equipment can so seriously distort the reserve accumulation structure that the utility may easily find itself without proper reserves at a period some time in the future, if life tables be based upon the mental impression received from the name of the account.

### Determination of the Interest Rate

The question of interest rate to be used in connection with sinking-fund accumulations may or may not be open to decision by the utility. In some cases the interest rate is definitely fixed by the regulating commission and the latter may even go so far as to insist that strict accounting for the reserve be made and reported in the same manner as other phases of company activity covered under governmental regulation. There is a general theory involved here, however, based upon the economic law that capital will flow only to such points as will assure a return commensurate with the interest earned by similar risks in other situations. If a utility sets aside depreciation annuities, it is logical to assume that this money should be invested in some interest-bearing security which will be of a degree of risk similar to that of the business of the utility itself. The risk of the utility is measured by the risk of the bonds, for the bonds, in the last analysis, are only as secure as the going property. The reserve may be invested in the property itself, and this is commonly done. It follows naturally, therefore, that depreciation reserve accumulations invested in plant may logically carry an interest rate similar to that of bond money for utilities, for the utility usually has the option of either borrowing outside money or using its own reserve.

The argument is sometimes advanced that preservation of the integrity of the reserve is of utmost importance and that a degree of safety commensurate with deposit in the savings bank should require the utility to allow only 4 or 5 per cent interest on the amounts under accumulation. If, in such a case, the utility invests the reserve in its own business, it must, by the same token, assume the risk of preserving the integrity of the money with an implied guarantee backed by surplus. While this argument has often been advanced, the procedure is not in common use and sinking-fund accumulations are more often at an interest rate commensurate with the cost of borrowed time money. Six per cent is a common interest rate for sinking-fund accumulations. With the present tendency toward lowering of money rates and the possibility that economic conditions in the United States may cause a permanent lowering of the interest level, it is somewhat problematical what the future will bring in this respect.

### Approaches Straight-Line Method

In general, the lower the interest rate, the more nearly the calculation approaches the conditions inherent in the straight-line method of accumulation discussed in previous articles, and it is true that the special conditions attaching to compound interest rates as described in this article are effective in a constantly increasing ratio as the interest rate increases.

The use of the sinking-fund method of accumulation, therefore, introduces the danger that theoretical assignment of extremely long lives to items of plant may produce detrimental results in the actual practice of the utility, and common business prudence demands that estimated lives must be kept within careful limits, for the most beautiful theory might be completely wrecked by the actuality of some advance in the public utility art. To preserve the stability of utility properties requires not only the theory of the mathematician but also the practical judgment of the business man and the exercise of good judgment in laying aside reserves to cover property being used in the service of the public. Common sense and business acumen are vital factors, not only from the utility point of view but from the point of view of future successful and adequate service to the public.

## Commercial Lighting Campaign Increases Load 200 Kw.

By E. F. Champion

*Illuminating Engineer Georgia Power Company*

THE Georgia Power Company recently completed its third commercial lighting campaign, the results of which far exceeded the quota and expectations. A merchandising profit of more than $2,300 was realized. The total number of units sold was 1,615, which represents an increase in kilowatts of connected load of approximately 200, since the majority of the units replace 100, 150 and 200-watt equipment.

During this campaign it was decided to make a concerted effort on one type of fixture. The one chosen consisted of a 6-in. bronze suspension hanger with Mogul socket and 6x16-in. plain opal glassware. The unit was offered complete with 300-watt lamp, but if this size would overload the customer's present circuit, or cause an objectionable increase in his light bills, a 200-watt lamp was substituted for the same cost.

The selling price of the unit installed on present outlet, complete with lamp levolier switch, was $12. Where outlets or wiring required changes, an extra charge was made. Terms of $1 down and $1 per month were offered, with a discount of 5 per cent for cash within 30 days. The cost of the unit was $5; lamp, 80 cents; switch, 50 cents; hanging, $1.50; salesmen's commission, $1.75; advertising, $1; total, $10.55. This left a gross profit of $1.45 per unit.

The regular members of the sales department were used during this campaign. The territory served was divided into districts, each under the charge of a supervisor with entire control of sales and installation. The men worked in pairs and, since demonstration units were carried, while one salesman was connecting and preparing for the demonstration, the other salesman was selling the customer on the idea of better illumination. The salesmen alternated in carrying the unit and making demonstrations. Commissions were divided equally. Each salesman was given a territory or street each day, and was required to make a report on all the customers called on. These reports were carefully checked to be sure that the salesmen did not miss any of the prospects, and to furnish information to the illuminating engineers to follow out for the prospects on special application of lighting. The contracts for hanging the units were awarded to the three contractors submitting the lowest bids.

The principal prospects were the small stores and old office buildings. In many instances old glassware and lighting units were replaced by the newer type opal fixtures. In almost every case it was found necessary to sell the prospect on better illumination and what better illumination would do for him. After this, getting the signed orders for the fixtures was comparatively easy.

## Substation Architecture Conforms With Adjacent Apartments

SUBSTATIONS erected by the Edison Electric Illuminating Company of Boston are being designed to harmonize with surrounding structures. One built recently in the Commonwealth Avenue apartment house terrritory is illustrated. A self-cooled, 12,000-kva., three-phase transformer with a 25-hp. motor-driven blower for cooling the transformer room is housed in the reinforced-concrete tower. A 3,500-gal. receptacle permits the transformer to be drained of oil if necessary. Energy is received from the Edgar generating station at 25 kv. and delivery is at 13 kv. An important connection with the system of the Cambridge Electric Light Company is also made at this point.

# Fractional-Horsepower Motors Standardized

### Final report of committee. Two lines of motors based on hours of use. Efficiency, power factor and apparent efficiency values fixed

BY A PROCESS of open discussions between all interested groups and through the workings of a cordial spirit of co-operation the joint committee on fractional-horsepower motors has obtained agreements which are expected to bring about very desirable results. In a series of meetings held during the past twelve months the committee has brought about a greatly improved situation in the industry. This committee was composed of representatives of the National Electric Light Association, the National Electrical Manufacturers' Association, the American Washing Machine Manufacturers' Association, the Association of Edison Illuminating Companies and, in addition, unorganized appliance manufacturers were represented by individuals. The committee was initiated by Prof. C. F. Hirshfeld of the Detroit Edison Company and worked with L. W. W. Morrow of the ELECTRICAL WORLD as chairman.

The work of the committee dealt with improving fractional-horsepower motors through agreements as to minimum specifications for efficiency, power factor, starting current and apparent efficiency. The economic cost to the industry as a whole has been weighed and each group has contributed a share of the burden. The committee feels that its work will react to the benefit of the industry and will stabilize the fractional-horsepower motor situation for some years. It asks for the hearty co-operation of all groups in the industry so that its recommendations may be put into operation.

### SUMMARY OF ACTION

After careful consideration the committee decided that there should be two general classes of fractional-horsepower motors, as follows: (1) Long-hour use motors. (2) Short-hour use motors. Long-hour use motors are those which operate a large number of hours per month in the aggregate and consume sufficient energy to make efficiency of economic importance. Specific applications for these motors agreed upon by the committee are electric refrigerators and electric oil burners. Short-hour use motors are those which are in operation a relatively small number of hours per month so that their consumption of energy is small. Typical applications of these motors are washing machines, dish washers and home food choppers.

Minimum specifications for long-hour use motors and for short-hour use motors operating on 110-volt, 60-cycle circuits at 1,800 r.p.m. as agreed on are given in the accompanying tables. The short-hour and long-hour use motors have the same current specifications and approximately the same power-factor specifications. The major difference is in efficiency values. These efficiency differences are expected to be reflected in motor prices.

### EXCEPTION FOR WASHING MACHINE MOTOR

The values given apply to all 4-pole, 110-volt, 60-cycle fractional-horsepower motors with the exception of the washing-machine motor. It must conform to efficiency, power factor and apparent efficiency specifications, but not to locked rotor ampere values. After careful study the joint committee felt that time should be given for working out the washing machine problem and it agreed that the washing machine situation warranted, for the present, an exception in regard to the locked rotor ampere values for all other applications.

The ¼-hp. long-hour use motor should meet these specifications as of Jan. 1, 1928. Motor manufacturers agreed to develop the other sizes and types to meet the specifications as soon as possible and an ultimate date of Jan. 1, 1929, was agreed upon as the time all new motors should conform to the new specifications. Motors characterized by these specifications represent a great improvement on existing motors and necessitate a complete redesign of the majority of fractional-horsepower motors now made. The time element was considered a minimum in view of the time required to redesign, retool and get production in factories.

These specifications apply to motors which are normally connected to lighting circuits and which may be expected to operate at times during lighting hours. The values given are minimum values obtained by test after the motor has operated a reasonable time (at least 24 hours) to limber it up. It was agreed upon as desirable that motors of the 1,800-r.p.m. ¼-hp., 110-volt, 60-cycle size should be produced as soon as possible with a full-load efficiency of at least 70 per cent and a full-load power factor of 65 per cent, giving an apparent efficiency of at least 45.5 per cent. It was thought such motors for refrigerators and oil burners would be justified in price by capitalizing the cost of energy used as compared to a cheaper but less efficient motor.

The joint committee adopted the new specifications for use in this country. Motor manufacturers are committed to an expense of upward of $1,000,000 in redesign and retooling costs. The utilities promised to do their part toward securing the use of the proposed motors and to urge that all central-station companies adopt uniform rulings in agreement with the recommendations of the joint committee because the use of present motors seriously affects utility service. Appliance manufacturers promised to follow the specifications and principles agreed upon by the joint committee.

The report of the committee was submitted for approval to the associations represented on the committee and already has the approval of the majority of the individual appliance manufacturers. The joint committee believes prompt action should be taken by the parent organizations and that, if approved, this report be distributed to each member so that he may be guided by the committee findings.

MINIMUM SPECIFICATIONS FOR LONG-HOUR USE MOTORS OPERATING ON 110-VOLT, 60-CYCLE CIRCUITS AT 1,800 R.P.M.

| Rating in hp. | ⅛ | ⅙ | ¼ | ⅓ | ½ | ¾ |
|---|---|---|---|---|---|---|
| Power factor in per cent | 52 | 56 | 60 | 61 | 63 | 65 |
| Efficiency in per cent | 53 | 58 | 62 | 63 | 65 | 67 |
| Apparent efficiency in per cent | 30 | 36 | 42 | 44 | 47 | 49 |
| Locked rotor amps | 20 | 20 | 20 | 20 | 26.6 | 40 |
| Locked rotor amps. at 75 per cent load | 15 | 15 | 15 | 15 | 20 | 30 |

MINIMUM SPECIFICATIONS FOR SHORT-HOUR USE MOTORS OPERATING ON 110-VOLT, 60-CYCLE CIRCUITS AT 1,800 R.P.M.

| Rating in hp. | ⅛ | ⅙ | ¼ | ⅓ | ½ | ¾ |
|---|---|---|---|---|---|---|
| Power factor in per cent | 50 | 52 | 56 | 58 | 60 | 62 |
| Efficiency in per cent | 41 | 46 | 51 | 54 | 58 | 61 |
| Apparent efficiency in per cent | 24 | 27 | 32 | 35 | 39 | 42 |
| Locked rotor amps | 20 | 20 | 20 | 20 | 26.6 | 40 |
| Locked rotor amps. at 75 per cent load | 15 | 15 | 15 | 15 | 20 | 30 |

NOTE.—Where the product of the minimum values of power factor and efficiency, as shown in the table, do not equal the apparent efficiency it is understood that either the power factor or the efficiency values will be increased by the manufacturer to make the product of power factor and efficiency equal to the stated apparent efficiency.

# Southern Pine and Creosoting

Characteristics of wood. Woods operations and treating processes. Applications and service experiences. Purchases and specifications

By L. W. W. Morrow

*Managing Editor* Electrical World

WHAT are the characteristics of creosoted Southern yellow pine? What are the service experiences of those using treated timber? What specifications are advisable for purchasing creosoted poles, ties and structural lumber?

The use of creosoted pine is growing rapidly, and with that use, the foregoing are some of the questions that arise in the minds of prospective purchasers and users unfamiliar with this treated wood.

It is important that these questions be answered, for the near future will see the timber markets supplied largely from the forests of the South and of the West. A significant fact in this connection is that the annual statistics compiled by the government show twice as many creosoted pine poles used in 1924 as in 1923. Creosoted Southern pine and timber from the forests in the far West are used in increasingly large quantities, for the chestnut, Northern cedar and other familiar woods of the East and Middle West have been used more rapidly than they are produced. The South has large forests of pine, and new trees grow so rapidly that exhaustion of the supply is impossible if ordinary precautions are taken. In from 20 to 25 years a pine tree can be grown that will give a pole 20 ft. long with a 6-in. top.

### Three Kinds of Pine Used

The general term Southern yellow pine applies to three principal types of conifers. These are the "longleaf," the "shortleaf" and the "loblolly." Their strength characteristics as compared with that of other woods used for poles are indicated in the accompanying table. As among themselves there is a slight difference in the density, in the number of growth rings per unit cross-section, in the length and arrangement of needles and in the depth of sap wood, but their structural difference is so slight that, once away from the stump, they can be distinguished only with difficulty. All possess structures which admit of creosote oil preservative treatment to best advantage both as regards the depth of penetration and the quantity of creosote absorbed in the wood.

The untreated timber is subject to rapid decay under outdoor service conditions, and the creosote treatment is used to insure the quality and strength of the wood over a long period of time independently of weather exposure in service.

Through the courtesy of the International Creosoting & Construction Company the writer was privileged to visit and inspect its operations from woods to plant at Texarkana, Tex. The pine in this region is purchased from local producers within a 300-mile radius of Texarkana. Division organizations with a staff of inspectors care for the product until it arrives in the large yards in Texarkana. The pines are cut by hand labor, using crosscut saws. The branches are removed, then the top, and finally all the bark is peeled from the trunk, after which the pole in embryo is inspected for dimensions and condition and then is accepted or rejected. A frequent cause of rejection is the presence of a "punk knot." This is a defect in the tree which may show only as a small opening on the surface and yet the interior of the trunk may be rotted for several feet above and below the knot. Railroad ties are produced by local crews in a similar manner to the poles and are hewed to dimensions. In order to pass inspection they must meet the specifications of the American Railway Engineering Association. The inspectors work in pairs and must have had a previous training in woodsmanship and treating methods used at the plant and finally must serve a woods apprenticeship under an experienced inspector.

PEELED POLES IN A SOUTHERN WOOD

After the woods inspector has passed upon the timber and classified and marked it, the material is placed on cars and shipped to the plant at Texarkana. Upon arrival in the yard the poles are unloaded by locomotive cranes. All the timber is inspected carefully at this time, and if it is to be treated immediately, it is framed and roofed and loaded on cylinder trams. If the timber is to be air seasoned, it is taken to the storage yard and placed in stacks, with creosoted separators inserted to give ample air space between pieces. The yard is well drained by tile sewer lines and no grass or other vegetation is permitted to grow. Evaporation of moisture from the stacks is further facilitated by the fact that the bottom of each stack is at least 2 ft. above the ground and rests on creosoted blocks.

The seasoning operation is very important; the timber in the yards is watched closely and borings for moisture are taken regularly. When the moisture content is about 30 per cent, the wood is ready for treatment. It is inspected carefully for the third time and either receives the full treatment specified by the purchaser or a 4-lb. per-cubic-foot treatment, which is sufficient to preserve the wood for the short time it will be retained in yard storage previous to the full treatment required on a purchase order.

Texarkana, Texas. PLANT

TOTAL TIME OF TREATMENT 5 HOURS 20 MINUTES

CHARGE RECORD USED WITH RUEPING PROCESS OF WOOD-POLE IMPREGNATION

A large treating plant was found in operation at Texarkana. Two large cylinders, four creosote tanks of 90,000 gal. each, a creosote storage tank with a capacity of 300,000 gal., a boiler plant of 700 hp. and accessory equipment for producing, transmitting and using steam, air and creosote comprise the essential equipment used in the treating process. One of the steel-treating cylinders has a diameter of 9 ft. 6 in., is 165 ft. long and is made of 1-in. steel plate. Steel doors are located at each end of this cylinder and a standard narrow-gage track is installed upon which the loaded cylinder trams may be operated. The cylinder has a capacity of from 80,000 to 85,000 ft. and is used to treat poles, ties and structural timber as desired. The second cylinder is 6 ft. in diameter, is 125 ft. long and has a capacity of about 20,000 ft. of timber. Poles with 10-in. tops and 110 ft. long have been treated in these retorts.

There are three processes for treating poles with creosote: the Rueping empty cell, the Lowry and the Bethel full cell. The International Creosoting & Construction Company is equipped to use all of these processes, but uses the Bethel full cell and the Rueping empty cell processes. For poles it is customary to use 8 lb. of creosote per cubic foot in the empty cell process and 12 lb. in the full cell process.

### EMPTY CELL PROCESS

In the Rueping process, as the first step, air is pumped into the cylinder and thus into the wood under high pressure; then while the air pressure is maintained the cylinder is filled with creosote at a temperature of between 180 and 200 deg. F. As the oil enters, the air is gradually released but without allowing the pressure to drop. In this way the cylinder is filled with oil, but a considerable quantity of air is entrapped in the wood. More oil is then pumped in and the pressure increased until it finally reaches a maximum of 165 to 200 lb., the exact figure depending on the individual characteristics of the wood under treatment. After sufficient creosote has been injected this pressure is released, the oil is drained from the cylinder and a final vacuum is applied. This release in pressure allows the air entrapped in the wood to expand and force much of the oil out of the

SAWING A PINE TREE INTO LENGTHS FOR MAKING TIES

wood, leaving partly empty wood cells and the final retention of creosote specified by the customer.

In the Bethel process, after the material is placed in the cylinder, a vacuum of about 26 in. is maintained until the wood is as dry and free from air as practicable, and then, without first breaking the vacuum, the cylinder is completely filled with the creosote oil. The vacuum not only accelerates the entrance of the preservative into the retort but also makes it possible to force the preservative into the timber more quickly and with less pressure than is the case when the preservative must displace or compress the air in the wood. After the retort is filled, additional creosote is forced into the cylinder by means of pressure pumps, the pressure being gradually raised to and usually maintained at not less than 125 lb. per square inch at a temperature of 180 to 200 deg. F., until the required amount of the preservative has been forced into the wood. The pressure is then released, the oil drained from the cylinder and another vacuum drawn. The object of this final vacuum is to remove the surplus creosote from the surface of the timber and hasten the dripping so that the treated wood can be removed from the cylinder as soon as possible. The final vacuum also makes the wood drier on the surface and cleaner to handle.

In either treatment 100 per cent of the quantity of creosote specified by the customer's order is the minimum quantity retained by the wood.

The creosote used in the treatment conforms to A.R.E.A. specifications, and a laboratory with a staff of three graduate chemists is maintained to test the creosote, to supervise the treatments and to do development work. The usual tests on the creosote are based on fractional

MAKING A SQUARE-EDGED TIE

TABLE I—CHARACTERISTICS OF WOODS USED FOR POLES
Taken from U. S. Department of Agriculture Bulletin 556

| Type of Wood | Breaking Strength, Lb. per Sq.In. Modulus of Rupture | Impact Strength Height of Drop (In.) Causing Complete Failure When Using 50-Lb. Hammer | Shearing Strength, Lb. per Sq.In. | Crushing Strength, Lb. per Sq.In. |
|---|---|---|---|---|
| Chestnut | 5,600 | 24 | 800 | 2,470 |
| Western red cedar | 5,200 | 17 | 720 | 2,840 |
| Northern white cedar | 4,200 | 15 | 620 | 1,990 |
| Southern longleaf | 8,700 | 34 | 1,070 | 4,390 |
| Southern shortleaf | 8,000 | 39 | 890 | 3,810 |
| Loblolly | 7,500 | 32 | 900 | 3,580 |

distillation whereby a given quantity of creosote is heated and the fractions distilled at successive temperature increments are measured. The residue is then subjected to a standard test and the complete test results are balanced against the specifications. A skilled chemical control of the curing and treating process is considered essential to good products.

## SAMPLE SPECIFICATIONS

A large utility in the South which has used creosoted poles for many years presented the writer with a copy of the specifications now used for the purchase of these poles. This utility reports splendid service from the creosoted poles and purchases them in large quantities each year. The specifications are as follows:

*Quality of Poles.*—All poles shall be cut from live, sound, dense Southern yellow pine, well proportioned from top to butt with a maximum sweep or curvature in one direction only of 1 in. for each 10 ft. of length measured at right angles to a line from the top of pole to a point 6 ft. from the butt. Poles must be free from large season checks, blisters or other irregular markings, and must be peeled free of inner bark. Knots must be trimmed close and the butt sawed along a plane which shall not be out of square with the axis of the pole by more than 2 in. per foot of butt diameter. A maximum of 3 ft. of boxed section of a tree may be included in a pole, measured from the butt, and this must not reduce the cross-section of the butt by more than 20 per cent.

*Seasoning.*—It is essential that all poles be air seasoned in the yard for a minimum of 30 days or as much longer as local experience will allow before sap wood decay of any nature will set in. In the air seasoning, care must be used in stacking the poles to permit of minimum contact between poles and to eliminate any contact from pole to ground. Where the time permitted for air seasoning is restricted, suitable modifications are required in the tank seasoning process. (See particulars for treatment).

TABLE II—ANNUAL CHARGES OF CREOSOTED TIMBER*

TIE IN OPEN TRACK

| | Plain Tie | Creosoted Tie |
|---|---|---|
| Life, years | 7 | 15 |
| Cost of tie | $1.02 | $1.15 |
| Cost of installation | 0.75 | 0.75 |
| Total | $1.77 | $1.90 |
| Interest, 7 per cent | 0.12 | $0.13 |
| Depreciation | 0.25 | 0.13 |
| Cost per year | $0.37 | $0.26 |
| Saving per tie per year | ..... | 0.11 |
| Saving per mile per year | ..... | $290.40 |

30-FOOT POLES, CLASS A

| | Chestnut Plain | Pine Creosoted |
|---|---|---|
| Life, years | 5 | 22 |
| Cost of pole | $9.00 | $11.35 |
| Cost of setting | 10.00 | 10.00 |
| Total | $19.00 | $21.35 |
| Interest, 7 per cent | $1.33 | $1.49 |
| Depreciation | 3.80 | 0.97 |
| Cost per year | $5.13 | $2.46 |
| Saving per pole per year | ..... | $2.67 |
| Saving per mile per year (105.6 poles) | ..... | $281.95 |

1,000 BOARD-FEET OF BRIDGE TIMBER

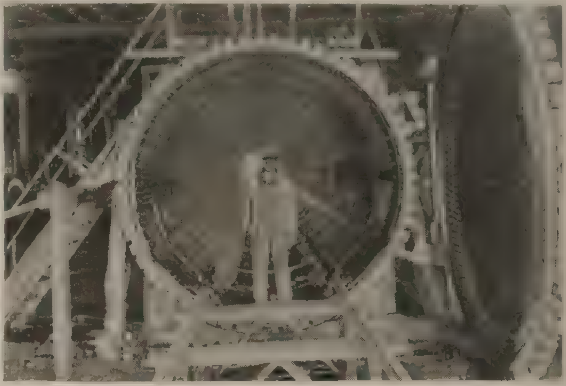
| | Plain | Creosoted |
|---|---|---|
| Life, years | 12 | 25 |
| Cost, erected | $65.00 | $75.00 |
| Interest, 7 per cent | $4.55 | $5.25 |
| Depreciation | 5.42 | 3.00 |
| Cost per year | $9.97 | $8.25 |
| Saving per year per 1,000 b.ft. | ..... | $1.72 |

* C. A. Smith, Georgia Railway & Power Company

*Dimensions.*—The top dimensions of the poles shall be not less than the dimensions specified on purchase order, with a minimum taper of 1 in. in 10 ft. of length.

*Framing Poles.*—Before poles are subjected to the creosoting process, they shall be roofed and gained as indicated by drawing number specified on purchase order. Each gain shall be not more than ½ in. deep unless otherwise specified. Where more than one gain is required, they must be parallel and all holes must be squared with the axis of the pole. When a pole has a sweep or curvature, the gains must be made on the concave side. These requirements must be fulfilled and all work performed in a neat and workmanlike manner.

*Selection of Timber for the Charge.*—In order to secure uniform oil admittance in each pole in a specific batch prepared for a charge in the closed tank consideration must be given in selecting the batch, seasoning, proportion of heart to sap wood, proportion of size of resinous to pitch wood rings, number of rings per inch, and local conditions, together with the experience of the practical operator of the tank or cylinder.



EMPTY RETORT WITH A TALL NEGRO IN THE OPENING

*Creosote Treatment of Poles.*—In lieu of a specific process for the various methods of creosoting timber, the procedure outlined by the American Wood Preserving Association covering the 10 lb. "open cell treatment" shall be used unless otherwise specified. Attention is called to the necessity of each bidder submitting a graphic chart of the method used in treating timber. Treatment must be given a minimum of 1½ in. penetration when sap wood is 1½ in. or less in thickness. Where greater than 1½ in. in thickness, complete penetration of sap wood is required.

*Specifications for Creosote Oil.*—The grade of oil used in the treatment of timber shall be of a quality similar to that specified by the American Railway Engineering Association as No. 1 oil.

*Inspection of Material.*—Adequate facilities must be provided by the manufacturer for the inspection of timber by an authorized representative of the purchaser, and the purchaser reserves the right to reject any or all timber not conforming to the above specification.

The waiving of inspection by the purchaser does not relieve the manufacturer of the responsibility of conforming to the specifications, and the purchaser reserves the right to reject any or all unsatisfactory uninspected timber at the point of delivery.

Approximately 100 commercial plants in the South are creosoting pine poles, and several utilities have installed a creosoting plant for their own work. It is the opinion of purchasers of creosoted timber that many of these plants can do much to produce a uniformly good product and one that does not require rigid inspection by the purchaser. In the present highly competitive market it is advisable that purchases should be made on the basis of detailed specifications and careful inspections by men who know timber and understand creosoting and from reputable creosoting companies. One large purchaser reports a rejection of about 2 per cent on poles bought from local creosoting companies and states that a uniform product is difficult to secure.

# Who Pays the Cost of Price Cutting?

A frank discussion of the warfare now being waged between the purchasing agents and the sellers in this buyers' market

By Earl Whitehorne
*Commercial Editor* Electrical World

WITHIN the memory of this generation there has never been a time when business men were talking more about the ethics and the economics of price cutting. It is an engrossing subject of conversation in the electrical industry right now. It concerns the power companies because they are large buyers. It concerns the electrical manufacturers because they are selling to these large buyers. It concerns them in the same way that the same conditions are involving other large buyers and sellers in numerous other industries. But the fact that these conditions are general does not make them any less particularly a problem which the electrical industry must face in its own field and work out for itself.

## In a Buyers' Market

We are, of course, in a buyers' market. There is excess capacity and overproduction in manufactured products and an intense competition for orders. But that is not all. We have had other periods when the buyer was in the saddle, riding the salesman whip and spur, just as we have had sellers' markets, when demand exceeded supply and the pressure was upon the purchaser; during the war, for instance. And whereas then the salesman was playing one buyer against another for a better price, the purchasing agent today is juggling one seller against another for a lower figure. It is not unnatural. The purchasing agent feels that it is now his time to be the wolf. It is his night to howl. But times have changed, and what was once considered a fair game of bartering has come to be a matter of the economics of an industry.

For there has been much progress in the thinking of American business. The pack peddler and the patent medicine man have gone their way with their wooden nutmegs and fake nostrums. The days of barter in the village store have given place to a one-price policy in retail trade. Modern business ethics have purged the manufacturing field of many practices that once were looked upon as quite legitimate, but now are recognized as unfair either to the customer or the competitor. And now a new advance in the evolutionary process has introduced another idea—the responsibility of business men to protect the economic health of the industry in which they are engaged.

In other words, the growth of American industry has brought with it an extremely complex inter-relationship among manufacturers and between buyers and sellers throughout the land. Specialized production has developed a tremendous volume of interindustry trade in materials, equipment and services. And also large concentrations of capital and industry have resulted in a degree of interdependence between the buyer and the seller in such an industry as ours as has never been known before. And the present discussion of the prevalence of price cutting by manufacturers and profiteering by large purchasers has to deal with these new conditions.

### Some Experiences in Price Cutting

*THE purchasing agents of large buyers are being accused of profiteering. The complaining manufacturers are being charged with lack of price courage. What is it all about?*

*In this article Mr. Whitehorne arrays the major factors in the situation. There will follow a further discussion of "Some Experiences in Price Cutting," in which the methods that are at present demoralizing the market for electrical apparatus will be described. The editors will welcome a frank expression from our readers on this important and much-disputed issue.*

## An Industry Concern

Obviously it is poor business to be a party to a transaction in which either side is going to lose money. That is just common sense. For it usually costs more to win a new customer than the profit on the first order he gives. It is the continuing business from the account that pays. And it costs money also for a large buyer to take on a new supplier and establish an understanding of special needs and a dependable service. Usually it costs more than is gained by changing to another line just to seize a slight price advantage on the initial order—which is too often offered as a bait.

But there is more to it than that today. For so vast is the flow of goods and so greatly is the modern buyer sustained in his own business by his suppliers that a large industrial organization has come to be vitally concerned with the prosperity of the other organizations from which it draws. Put a manufacturer out of business by rendering it impossible for him to make money and you must look elsewhere for your next shipment of whatever it is you need. Let him live and he will continue to help you make more money. And that is precisely the philosophy that has dominated in those much-heralded cases where a large buyer has examined into a seller's costs and refused to accept cut prices that netted him a loss, knowing that either this seller must hereafter skimp on quality or service or ultimately go to the wall—unless the price level is restored.

## Three Recommendations

1. *That bids on standard listed apparatus should be offered for examination by any bidder who is called back and asked for a reduction of his price.*

2. *That salesmen should demand this as evidence of good faith on the part of the buyer whenever asked to cut a price after bids are in.*

3. *That post-mortems on competitive bids should be made standard practice among all manufacturers so that losers may understand their lost business.*

In the electrical industry, where an expensive engineering type of equipment is involved, the buyer also relies upon the manufacturer for another vital resource. He looks to the manufacturer to advance the art, to conduct expensive research, to carry forward the progress of engineering development. And if the manufacturer is denied profits that are adequate to finance the cost of it, then this will gradually cease and the industry must sacrifice one of its most priceless assets, unless the buyer assumes the burden.

Samuel Insull stated it well for electrical men in a much-quoted address in Chicago not so long ago. He said:

> You men who are in the branches of the business other than the central station—you have problems of your own. But the interdependence of the industry makes your problems ours, as it makes our problems yours. Central-station development creates the market for you and keeps it expanding. Development on your side assists our efficiency and facilitates use of our product.
>
> If competition in the sale of turbo-generators or cables or transformers is so keen as to hamper research work and threaten the quality or the rate of development; if too narrow margins restrict the wholesaler's ability to carry adequate stocks, supply sales service and extend credit to the retailer; if the keenness of competition between contractors impairs the adequacy or quality of wiring; if construction is hampered or not properly remunerated on account of policies in other branches of the business—if any of these things happen, the central-station companies, which use those materials and services, finally suffer the most.
>
> And, finally, the paramount responsibility, imposed upon all of us by our common interests, is to see to it that no obstacles are placed in the way of general electrical development—a development that is not yet nearly completed, but has already done so much to make our country the envy of all the world.

### How It Is Done

Coming down to cases—just what is the situation in the electrical industry? Two things are happening:

**1. Purchasing agents of large buyers are rigorously applying the thumbscrews to the manufacturers' salesmen and beating down price levels by ingenious methods of induced competition.**

**2. Manufacturers in their eagerness for volume are weakly submitting to this pressure and cutting prices to get orders that net a loss and demoralize their market.**

The first reaction is to just say, "Well, under the circumstances the purchasing agents are smart and the manufacturers are not. Why worry?" But when you look ahead and ask yourself what the consequences may well be within this highly interdependent community of business interests if this condition should continue very long, you realize that in the end the buyer would suffer with the seller, and the entire industry would be the loser by it all. Large-scale profiteering by purchasers, widespread price cutting by manufacturers in this day and age soon become a common problem.

What is to be done? It would seem that the burden of reform would rest upon the manufacturers, who possess the right to accept an order or decline it as they wish. But as every manufacturer knows, the demand for volume is a remorseless pressure upon the sales department that must feed orders into the hungry hopper of a modern factory. And since the Sherman law forbids competing manufacturers to organize for mutual protection against the snares and pitfalls of a buyers' market, each one must take his chances in the open strife, and the price that can be charged depends upon the level of the market for competing lines. Let one sales manager weaken in the face of a persistent price squeezer and let a second fall in line and no other bidder can hope to hold to his figure and secure the business.

Apparently there remains but one legal and practical defense to which the manufacturer may have recourse. That is the organizing of industry opinion, to correct uneconomic practices and improve the standard of executive policy among both the buyers and the sellers. In other words, he must broaden the vision of the purchasing agent and stiffen the spinal structure of the sales manager.

### Too Much Secrecy

The seat of the present trouble, it would appear, lies in the old tradition of the secrecy of bids, for here is the keenest weapon that the buyer is employing at the moment. A group of manufacturers are invited to submit bids on equipment to be purchased. The bids are in. The salesmen call. The purchasing agent thereupon proceeds privately to play each man against the others, telling each that he is high, inciting each to telephone the factory, whipsawing them with fear and hope, until the last price cut has been exacted and the last unhappy concession wrested from the profit margin on the goods. Too often he who was the low man at the outset is the low man at the end, but minus profit. Too often, also, the order was all the time intended for him for some good consideration of the quality or service offered, in return for which he has been mulcted of his company's earning power on that sale. Because of the traditional sanctity of bids, he has been unable to demand a showdown when the bids are in, a chance to see whose price is really high—"which bird is early." For there are lying purchasing agents as well as lying salesmen and the temptation to play tricks with truth is sometimes great in buying.

Clearly, therefore, there are three things to be done as an approach to remedy:

1. Secrecy should be eliminated on bids for standard listed apparatus. Bids are published on government orders. Bids for private purchasers should be open to examination by any manufacturer who is called back and asked for a revision of his price. At present it is not supposed to be morally right to show a bid to a competitor. Where the bid entails a large element of engineering or other variables this secrecy will undoubtedly continue. But on standard listed apparatus—and this covers the major volume of the sales of industry—the buyer should show the bids when asking any bidder to reduce his price.
2. The salesman should demand this frank showdown whenever called upon to cut a price after the bids are in. He should expect it as an evidence of good faith on the part of the buyer. Manufacturers should refuse to consider a concession without this evidence.
3. The holding of post-mortems on competitive bids should be made standard practice among all electrical manufacturers, so that losers may analyze all bids and understand their lost business. This is lawful and already is being done to some extent, the exchange of bids being made by the bidders. The National Electrical Manufacturers' Association is actively promoting this idea and serving as a clearing house for its members. The practice should be made universal.

Of course, this would not end all cutting of prices. It would simply bring the practice out into the open and improve its morals. It would just be two steps toward an eventual one-price system.

But the seller should not be made to fight for this reform unaided. Purchasing agents individually and as nationally organized should also become the exponents of this idea. It is another step to be taken in the debunking of business, the banishing of deceit and trickery from trade. In this era of economic intelligence the gentle art of profiteering by purchasers should be laid away in shrouds along with the wooden nutmeg and that once popular commercial slogan, *caveat emptor!*

For men do not buy for price alone. Price is important. But other factors are equally important because they themselves constitute the value, for which the price is paid. The chief concern of the buyer should be to see that he obtains a value proportionate with the price. The chief concern of the seller should be to see that he obtains a price commensurate with the value. And these two ideals are not antagonistic. They go together like the well-known words *e pluribus unum,* to use more Latin.

Who pays the cost of price cutting, then? Both the buyer and the seller pay it. And in the end the entire industry suffers.

## Analyzes Employees' Attitude Toward Electric Range

A SURVEY was made recently by the Northwestern Electric Company, Portland, Ore., to determine to what extent its employees use electric ranges in their homes. Out of 514 employees, 70 per cent, or 362, replied to a questionnaire, and of this number 37.5 per cent of those maintaining a home were using electric ranges. This is more than double the range saturation of domestic customers served by the company.

Employee use of ranges tabulated by class of work showed that 53 per cent of the employees in the commercial department used electric ranges. Classes showing the lowest use of ranges were station operators and line department and accounting department employees.

CENTRAL-STATION EMPLOYEES' IDEAS ON THE ELECTRIC RANGE

**If you do not use an electric range now would you like to have one?**

| | |
|---|---|
| Yes | 135 |
| No | 39 |
| Doubtful | 2 |

**What features do you like best about electric cooking?**

| | | | |
|---|---|---|---|
| Cleanliness | 207 | Uniformity | 19 |
| Automatic control | 50 | Good looks of range | 13 |
| Less operating cost | 40 | No odor | 30 |
| Convenience | 55 | Safety | 14 |
| Better cooking | 29 | No waste | 7 |
| Less heat radiation | 14 | Less work | 16 |
| Efficiency | 31 | Cool | 19 |
| Quicker | 17 | Dependability | 8 |
| More palatable food | 12 | | |

**If you do not use an electric range, what is your objection?**

| | | | |
|---|---|---|---|
| Initial cost | 43 | Not married | 20 |
| Off company lines | 12 | Eat in restaurant | 5 |
| Not living at home | 13 | Have satisfactory range | 2 |
| None | 75 | Cost of operation | 3 |
| Use gas range | 17 | Not in permanent home | 4 |
| Use wood range | 6 | Range in use serves as heater | 2 |
| Rent, not wired | 10 | | |

**Do you take every opportunity to tell your friends of the advantages of electric cooking?**

| | |
|---|---|
| Yes | 272 |
| No | 2 |
| Sometimes | 5 |

Replies to several pertinent questions contained in the questionnaire are given in the accompanying table. This shows that cleanliness, automatic control, less operating cost and convenience were the features liked best, and that initial cost was the greatest objection of those who voiced any objection. The fact that 75 employees had no objection at all to the use of an electric range indicates that it should not be difficult to develop a much greater employee use of ranges than now exists.

## Floodlighting Sells Homes, Says Realtor

STARTING with November, 1927, the McDonald Realty Company, Schenectady, utilized floodlighting as a silent salesman to attract attention to its houses after dark. Experimentation with illumination to determine its sales influence was recommended by L. N. Lamboy of the New York Power & Light Corporation. Thirteen houses on one street were so illuminated. Five 500-watt L-09 and one 250-watt L-11 General Electric floodlighting projectors were employed.

2,750 WATTS FLOODLIGHT HOUSES, ASSISTING SALES

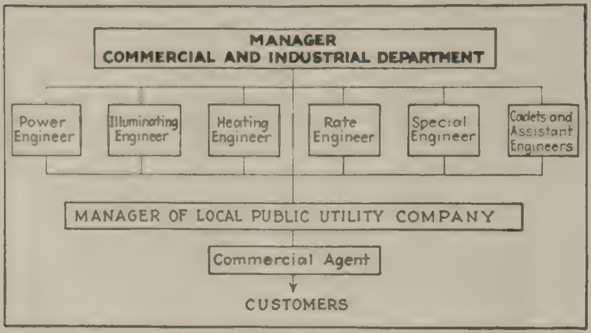
Commenting on the value of the floodlighting in creating sales, the realty company had the following to say:

"We are glad to say that many people were attracted, with the result that every evening large numbers of visitors turned out to inspect these homes, which resulted in furnishing a number of prospects and contributed to a great many of our sales. We are so pleased with this experiment that it is our intention to continue this form of advertising in our future building operations."

## Commercial and Industrial Set-Up of a Management Company

FROM a single power sales engineer in 1920, the personnel of the commercial and industrial department of Charles H. Tenney & Company, Boston, Mass., has increased to an organization of from fifteen to 25 persons, depending on the amount and importance of the work in hand from time to time. The public utilities under this management serve a total of about 145,000 electric and 182,000 gas customers. The duties and staff set-up of this department were recently described by its manager, V. M. F. Tallman, in the pending rate case of the Malden Electric Company before the Massachusetts Department of Public Utilities, and through the courtesy of Palmer York, president of the Tenney organization, the accompanying chart summarizing its commercial and industrial activities is reproduced.

The department is composed of specialists or key men in the sale of power, light and heat to commercial and industrial establishments, in the design of rates, drawing of contracts and conduct of special investigations. Five specialized engineers and a number of assistant engineers and cadets report to the manager. The work done is grouped under three sets of activities, as indicated on the chart. Electrical and gas appliance merchandising is conducted by the Tenney company's general sales department. The commercial and industrial department serves all client companies and others retaining the Tenney organization, besides conducting special investigations and tasks for the executives of the management group, and, as occasion warrants, carries on work involving the study of industry developments in its own field. In the field of residential rates alone fourteen investigations and reports have been made by the department within the past seven years.



*Activities of Department*

COMMERCIAL & INDUSTRIAL BUSINESS (Elec., Gas, Steam), POWER, LIGHTING, STREET & TRAFFIC LIGHTING, HEATING

a. Survey and analysis of territory.
b. Solicitation of all business.
c. Following inquiries from present plants.
d. Following inquiries from prospective plants.
e. Follow up of all business—present and prospective.
f. Sales policies and sale of equipment.
g. Sales engineering — efficient use of service.
h. Customer's installations.
i. Change over, from one form or type to another.
j. Tests, trial installations, etc.
k. Rates and contracts; analysis, design, preparation and filing.
l. Relations with customers, contractors, engineers, architects and manufacturers.
m. Special investigations.
n. Research and development.
o. Publicity.
p. Customer's adjustments.
q. Following practices of other companies.
r. Training of local personnel.
s. Statistical and graphical analysis.
t. Maintaining technical and sales reference library.

RATES & CONTRACTS (Electric, Gas, Steam), RESIDENTIAL, COMMERCIAL, INDUSTRIAL, MUNICIPAL, OTHER PUBLIC UTILITIES

a. Administration and execution.
b. Cost analysis.
c. Design of rate schedules, application cards, and service terms and conditions.
d. Preparation of contracts for power, lighting, wholesale service and street lighting.
e. Estimating effect of rate changes on revenues.
f. Publicity and announcements.
g. Special reports on rate matters.
h. Investigation and research work.
i. Preparation of rate schedules for filing with commissions and general publication.
j. Following rate practices of other companies.

SPECIAL WORK.

Responsibility for the preparation of all surveys of a commercial or industrial nature, and such other special work as may be requested, ordered or approved by the client company executive.

## Letters from Our Readers

### *Blueprint Ethics*

*To the Editor of the* ELECTRICAL WORLD:

Apropos of the article on page 1358 of the Dec. 31 issue of the ELECTRICAL WORLD, I cannot resist the temptation of a few comments. The blueprint story is, in fact, but one of the many phases of a complex situation involved in buyer and seller relationships.

The viewpoint of the buyer would, in my opinion, be far more tenable provided his buying ethics do not permit him to obtain prices nor to use the drawings and general information secured from one manufacturer as a means of educating some one else of obviously inferior engineering capacity and general ability to contribute his share to the art. Obviously, in such a case the original furnisher of the blueprint would have no opportunity whatever to improve his own work as a result of drawings that might be traded to him in exchange.

The only way in which the buyer's viewpoint could be supported in practice would be to make certain that he did not request prices nor attempt an interchange of drawings excepting among those firms which were organized on a parity and whose information and general practice, to say nothing of manufacturing costs, would place them on the same plane or in the same class.

I am sure the abuse has not resulted from following this rule, but from a sometimes irresistible desire on the part of the buyer to secure a cheaper price by taking the designs prepared in one company, which is organized with an engineering overhead and cost to do business such as makes it competent, and handing them to some machine shop from which good work may be secured, but which in itself would be entirely incompetent or lacking in the ability to produce the original ideas. If the organization with a good engineering design and the ability to produce it cannot market its product based upon such design and receive its worth from the buyer, what, then, is the incentive to maintain an organization and instill within it the pride of accomplishment, to say nothing of the ability to accomplish if only for the purpose of supplying ideas for others to bid upon in competition with themselves.

After all, and as usual, it is a matter of the buying policy of the institution. Some buyers are inherently and temperamentally quick to see the justice and importance of this argument and to proceed accordingly. The buying policy, however, will not be completely corrected until it is laid down by the responsible executives themselves. "MANUFACTURER."

# Digest of Electrical Literature

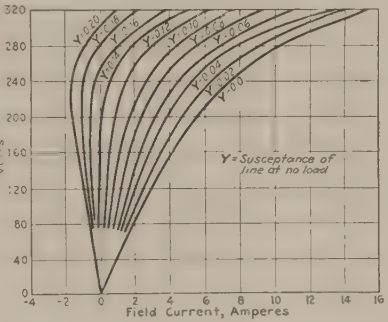
## *Hydro-Electric Development and Steam Equipment*

*A New Hydro-Electric Station.*—The Norrfors hydro-electric station built by the Swedish Government operates under a fall of water of approximately 127 ft. and has a number of unusual features, including the mounting of the generator 85 ft. above the turbine. The turbines have their own guide bearings, but no supporting bearings. The total weight of the rotating part of each set is carried by special bearings provided on the generators. Each stator frame is of ordinary open construction, with small radial depth behind the core plates and furnished with a great number of openings through which the warm air can escape into a duct placed round the stator in the building but under the machine room floor. It is claimed that the machine may be regarded as completely proof against short circuit. By means of hydraulic brakes each generator may be brought to a standstill from full speed in about two minutes and can be held stationary against water leakage through the turbines when the gates are closed. Special lifting apparatus permits the whole rotating system to be raised to allow of inspection of the supporting bearing and other lower parts. The rotating load is transmitted from the shaft through a steel ring to a supporting plate of cast iron furnished on its underside with a steel surface running on babbitt-covered self-adjusting segments. The whole bearing is immersed in oil, the sliding surfaces being below the level of the oil in the well, which is surrounded with a cooling spiral fed from a forced feeding pump for all the bearings. It was found on test that the machine could be run continuously with the separate cooling device out of action.—*Electrical Review (England)*, Jan. 13, 1928.

## *Generation, Control, Switching and Protection*

*The Application of Relays for the Protection of Power System Interconnections.*—L. N. Crichton and H. C. Graves, Jr.—A compilation of many of the new methods for relay protection required by superpower interconnections. The ideas have been obtained from various sources and represent what seem to be good present-day practices. Particular reference is made to protection against phase-to-phase short circuits in which the current is less than the full-load current. The clearing of accidental grounds is discussed and a new study of residual currents on systems of different types is given. This study indicates the usefulness of certain inverse time-limit relays on systems having dead grounded power transformer neutrals at all switching stations. Bus protection and "back-up" methods are described. Some of the new relays which have been developed, or improvements which have been made in older types in order that the new demands may be met, are described, and there is particular mention made of a recent relay installation similar to that being used in service on a 220-kv. interconnection.—*Journal American Institute of Electrical Engineers*, February, 1928.

*Alternator Characteristics Under Conditions Approaching Instability.*—John F. H. Douglas and Edward W. Kane.—The subject of generator instability is discussed in connection with the method of testing synchronous machinery in the unstable, as well as in the stable range. The results of tests performed upon several machines are given in connection with data and characteristic curves. As a result of this investigation, the authors conclude that by a reduction of the value of the transverse reaction with improved design, the production of machines of greater stability and consequent improved behavior under conditions of low leading power factor may be anticipated. It is stated that the problem of stability is likely to become more acute as the voltages, lengths of transmission line and the number of system interconnections increase, so that it is particularly desirable that the manufacturers be able to improve the stability of their machines.—*Journal American Institute of Electrical Engineers, January*, 1928.



RELATION BETWEEN GENERATOR VOLTAGE AND FIELD CURRENT WITH DIFFERENT VALUES OF LINE SUSCEPTANCE

## *Illumination*

*Tungsten Arc Lamp.*—F. Skaupy.—The glass-inclosed tungsten arc lamp is said to be gaining in popularity for purposes of projection, microscope illumination, etc. In this type of lamp two small balls of tungsten, suspended on wires which are as fine as possible, are inclosed in an evacuated glass bulb. The arc between the slightly separated balls is started by one of three methods: Ionization by an auxiliary heater, high-voltage impulse, or low-voltage glow discharge by suitable choice and pressure of the inclosed gas. Representative designs of these three classes are described. A European concern has recently perfected a tungsten arc lamp in which a bimetallic thermostat separates the electrode balls, starting the arc. Lamps of 100 to 1,000 cp. are marketed, consuming on an average $\frac{3}{4}$ watt per candle. The current rectifying properties of the tungsten arc are utilized in specially designed bulbs, for the conversion of alternating current into direct current. Such a lamp may also be connected into an oscillating circuit to change direct current into high-frequency alternating current. For example, 220-volt direct current may thus be transformed into 500-cycle alternating current with an efficiency of 35 per cent.—*Elektrotechnische Zeitschrift*, Dec. 8, 1927.

## *Transmission, Substations and Distribution*

*Power Transmission Over Long High-Voltage Lines.*—G. Oberdorfer.—Simple approximation methods have been made known in late years which permit rapid calculation of the characteristics of high-voltage lines. For the sake of simplicity, certain factors were neglected and the methods were limited as to line length. The recent trend of long transmission and tie lines makes it desirable to present a method which is not limited by the length of the line, and which is, at least as accurate and simple. A graphic-vectorial method is described which fulfills these requirements.—*Elektrotechnische Zeitschrift*, Nov. 17, 1927.

*Economic Base Width of Transmission Towers.*—C. R. Young, W. B. Dunbar, and C. E. Lewis.—An analysis of the various ratios utilized in the construction of transmission towers led to an investigation intended to establish an economic base width for such structures. A detailed study of the weights, specifications, and stresses, in a number of different towers resulted in the conclusion that the least-weight spread of base at the ground line of a typical square-windmill-suspension tower depends on the specification to which the tower is made, and on the slenderness ratio limits; that the reduction in the number of stories in a tower, using more stay members, and beginning the batter of tower legs at the level of the lower crossarm, has the effect of reducing tower weight, but adds to the pound cost of manufacture and erection; and that weight, in general, is saved by proportioning the diagonals to take both tension and compression, rather than tension resistance alone. Arbitrary limits with respect to slenderness ratio, areas of sections available, number of bolts practicable in end connections, and permissible allowances for over-stressing, tend to make actual weight curves irregular and not in accordance with any continuous mathematical function. This is one of three papers in the same publication upon the subject of transmission tower design. The others treat of the behavior of model transmission towers under load, and the effective length of bracing struts in transmission towers.—*Bulletin No. 7, University of Toronto*, 1927.

## *Units, Measurements and Instruments*

*An Electromagnetic Cyclograph.*—Takeo Akahira.—The instrument described in this article has been devised for the purpose of recording the relation between two given varying currents as a two-dimensional figure. In principle it is an electromagnetic oscillograph of the moving coil type. There are two single loops of four conducting strips stretched between two guide pieces of ivory and placed in a strong magnetic field. Thin and flexible cross wires are bridged over the strips of both loops midway between the guide pieces and a small circular mirror is cemented at the center of the cross fibers. The mirror vibrates around two rectangular axes simultaneously as actuated by currents passing around both loops. The current sensibilities are in the range of 0.2-2 milliamp. per millimeter of deflection at one meter scale distance and the natural frequency is about 2,000 cycles per second.—*Journal of the Institute of Electrical Engineers of Japan*, December, 1927.

## *Electrophysics, Electrochemistry and Batteries*

*The Time Lag of Spark and Surface Creepage.*—Matsunosuke Iwatake.—The comparative natures of the time lag of spark between needle electrodes and sphere electrodes in air, in oil, or in solid dielectric have been investigated for several sets of conditions. The method is characterized by several features including the utilization of the positive Lichtenberg figure; the application of two parallel electrodes to the photographic plate; and the use of an induction coil as the source of potential. The time was measured by the rotating film method, which is said to be simpler and easier to apply than the Dufour oscillograph method. The author concludes that in air the time lag of a needle gap is shorter than that of a sphere gap, while in oil the time lag of the needle gap is greater when using electrodes with spherical characteristics; that the time lag of spark across a needle plane gap in air or in oil or across a needle sphere gap in air is shorter when the needle is made positive, and longer when the plane or sphere is made positive; that the time lag of spark in a solid dieelectric is greater than in air, that there are few solid dielectrics which have greater value than oil; and that the time lag of a sphere gap in air or in oil does not depend upon the diameter of the spheres.—*Technology Report of the Tohoku Imperial University (Japan)*, 1927.

*The Electrostatics of the Thunderstorm.*—A. W. Simon.—The author has considered the phenomena involved in lightning discharges through the use of electrostatic analyses and reference to the generation of charges and potentials, induction and precipitation of charges, sudden application of electric stress and the numerical relations as involved in the gradients and similar influencing factors.—*Journal of the Franklin Institute*, November, 1927.

## *Motors and Control*

*Electrical Equipment for Boiler House Control.*—The opportunity for further economy in boiler house operation has led to the development of improved English electrical equipment. The various factors of operation are, in general, satisfactorily taken care of, but it is stated that the operation of the coal and ash handling plant is a separate problem from the control of the equipment which determines the amount of fuel and air which is actually fed to the boilers and that it is the former operation in which appreciable economies may be realized. A comparison is offered of the relative merits of: Direct current, alternating current with rotor regulation, alternating-current drive with pole-changing equipment and alternating-current computator motors, for the achievement of speed control of draught fans and other motor-driven equipment. Because of the desirability for the control of boiler house equipment from the firing floor, push-button devices are recommended for this service.—*Engineering (England)*, Jan. 20, 1928.

## *Heat Applications and Material Handling*

*Arc Welding Dynamo.*—E. Rosenberg.—The long-known "crossfield" generator, developed originally by the author for train-lighting purposes, has recently been improved for arc-welding service in which voltage regulation must be obtained with least attention. The designer succeeded in doing away entirely with all electrical regulation by equipping the generator with two magnetic poles, the flux of which can be changed mechanically to any desired density, depending upon the desired maximum welding current. The pole-pieces are attached to the yoke through thin steel tubes, within which slide steel pistons. Depending upon the position of the pistons within the steel tubes, the pole flux will be more or less restricted, thus limiting the short-circuit welding current to any desired maximum value. Hand wheels at the poles permit easy adjustment. The characteristics of such a generator are explained and presented on curve sheets. Portable sets are being manufactured with one induction motor and one or more cross-field generators. The latter can be used singly or in parallel for heavier welding work. The machines are entirely automatic, requiring no choke coils or rheostats.—*Elektrotechnische Zeitschrift*, Jan. 12, 1928, and *Elektrotechnik und Maschinenbau*, Jan. 15, 1928.

## *Telegraphy, Telephony, Radio and Signals*

*Symposium on Television.*—A group of five papers describing the apparatus and methods used in the experimental demonstration of television over communication channels of the Bell System. The chief problems presented in the accomplishment of television are discussed, including the resolution of the scene into a series of electrical signals of adequate intensity for transmission, the provision of a transmission channel capable of transmitting a wide band of frequencies without distortion, means for utilizing the transmitted signals to recreate the image in a form suitable for viewing by one or more observers, arrangements for the accurate synchronization of the apparatus at the two ends of the transmission channel. Each of these factors is considered in detail with reference to the technical problems involved in their accomplishment. In the discussion of the radio transmission signals for television the engineering of a radio system for television purposes is featured and a description of the facilities actually employed in the demonstration included. The tests to which the system were submitted to determine its suitability are outlined and the measured frequency characteristics are shown.—*Reprint B-274, Bell Telephone Laboratories, Inc.*

## *Miscellaneous*

*The Dimensional Theory of Steam Nozzle Flow.*—J. C. Oakden.—An investigation of the flow of steam through nozzle and blade passages of steam turbines. It is stated that one of the chief difficulties associated with investigations of such phenomena is the extreme complication resulting from the large number of independent factors upon which the amount of the energy loss depends. The friction loss in a steam nozzle is affected not only by the size, shape and roughness of the metal surfaces, but also by the velocity, density and viscosity of the steam at every point in its passage through the nozzle. The number of independent variables renders it difficult to compare the results obtained with different nozzles, or by different observers, since it is only on rare occasions that any two tests will be found to have been performed under exactly similar conditions. The author develops the equations and expressions for consideration in the investigation of steam nozzle flow, has enumerated the factors influencing the efficiency and has endeavored to incorporate them in the various statements.—*Engineering (England)*, Jan. 20, 1928.

# News of the Industry

## Federal Trade Commission to Investigate

### By a Vote of 46 to 31 Senate Substitutes That Body for Proposed Committee of Upper House—Warm Discussion Rages for Nine-Hour Session

NO LITTLE acrimony characterized a protracted fight in the United States Senate on Wednesday over the amendment moved by Senator George of Georgia to substitute the Federal Trade Commission for the committee of five senators proposed in the report of the interstate commerce committee of the Upper House as the body to conduct an investigation of the electric and gas industries, inquiring into activities and relations over which the federal government has or may assume jurisdiction. The final vote came at 9 o'clock in the evening after a debate which lasted for nine hours and was marked by frequent clashes between senators who defended the Federal Trade Commission as the logical and proper body to conduct the inquiry and senators who insisted that to select it was tantamount to burying the Walsh resolution and dropping the whole matter. Finally Senator George's amendment was adopted by a vote of 46 to 31, but not before the resolution before the Senate had been altered in other respects besides the substitution of the Trade Commission for a senatorial investigating committee. The amendment was opposed by the group of Republican "progressives" and by 20 Democrats, 18 Democrats and 28 Republicans voting for it.

The resolution as passed, including the George amendment, directs the commission to inquire into and report to the Senate "within each thirty days after the passage of this resolution and finally upon completion of the investigation" on the financing of electric and gas companies furnishing power and light in interstate business. Another provision authorizes an inquiry into the alleged political activities of corporations. It was decided to limit the investigation to events since 1923, to eliminate any mention of investigating the election of House members, and to dispense with a clause which would "direct" the investigating body to go into that phase. The investigators are merely "empowered" to proceed. The Senate also accepted an amendment by Senator Black of Alabama providing that the sessions of the commission during the investigation should be open to the public.

Senator Walsh of Montana, advocating the adoption of the original resolution, declared that the scope of the investigation would not be changed by the committee amendment limiting the probe to companies doing an interstate business. It never was his intention, Senator Walsh declared, to investigate the small companies doing an entirely intrastate business. The intention is to go into the financing and other operations of the great combinations with business extending into various states. The underlying corporation that sells its securities in interstate commerce would be subject to investigation under the resolution reported out by the committee, Senator Walsh said.

Senator Walsh had much to say about the "lobby" assembled by the industries affected, but made no reference to the "lobby" of those who are urging the investigation. He cited instances in which utilities are alleged to have expended large sums in efforts to control legislation in certain states.

In the course of his remarks, the Senator from Montana declared that the Federal Trade Commission had been packed to prevent it from functioning. He made a scathing attack on Chairman Humphrey. He also criticised Commissioner Myers.

Senator George of Georgia defended the Federal Trade Commission as being a properly qualified body to continue the study which it already had started. He held the state commissions competent.

Other senators who took part were Bruce of Maryland, who assailed Senator Walsh and vigorously repudiated the allegations that a great power lobby was influencing the course of the Senate; Watson of Indiana and Copeland of New York, who favored the George amendment, and Dill of Washington, Norris and Howell of Nebraska and Blaine of Washington, who opposed it.

### *Text of the Resolution as Passed by the Senate*

RESOLVED, that the Federal Trade Commission is hereby directed to inquire into and report to the Senate, by filing with the secretary thereof, within each 30 days after the passage of this resolution and finally on the completion of the investigation (any such inquiry before the commission to be open to the public and due notice of the time and place of all hearings to be given by the commission, and the stenographic report of the evidence taken by the commission to accompany the partial and final reports), upon: (1) the growth of the capital assets and capital liabilities of public utility corporations doing an interstate or international business supplying either electrical energy in the form of power or light or both, however produced, or gas, natural or artificial, or corporations holding the stocks of two or more public utility corporations operating in different states, and of non-public-utility corporations owned or controlled by such holding companies; (2) the method of issuing, the price realized or value received, the commissions or bonuses paid or received and other pertinent facts with respect to the various security issues of all classes of corporations herein named, including the bonds and other evidences of indebtedness thereof, as well as the stocks of the same; (3) the extent to which such holding companies or their stockholders control or are financially interested in financial, engineering, construction and/or management corporations, and the relation, one to the other, of the classes of corporations last named, the holding companies and the public utility corporations; (4) the services furnished to such public utility corporations by such holding companies and/or their associated, affiliated and/or subsidiary companies, the fees, commissions, bonuses or other charges made therefor, and the earnings and expenses of such holding companies and their associated, affiliated and/or subsidiary companies, and (5) the value or detriment to the public of such holding companies owning the stock or otherwise controlling such public utility corporations, immediately or remotely, with the extent of such ownership or control, and particularly what legislation, if any, should be enacted by Congress to correct any abuses in the organization or operation of such holding companies.

The commission is further empowered to inquire and report whether and to what extent such corporations or any of the officers thereof, or any one in their behalf or in behalf of any organization of which any such corporation may be a member, through the expenditure of money or through the control of the avenues of publicity, have made any and what effort to influence or control public opinion on account of municipal or public ownership of the means by which power is developed and electrical energy is generated and distributed, or since 1923 to influence or control elections of President, Vice-President and referred to shall be limited to the elections of President, Vice-President, and members of the United States Senate.

The commission is hereby further directed to report particularly whether any of the practices heretofore in this resolution stated tend to create a monopoly or constitute violation of the federal anti-trust laws.

# First Transatlantic Engineering Session

## American Institute and British Institution of Electrical Engineers Meet Jointly, Using International Radio Telephone—Symposium on Interconnection—Medals Awarded

BY MEANS of transatlantic telephony the American Institute of Electrical Engineers and the corresponding body in Great Britain, the Institution of Electrical Engineers, were enabled on Thursday morning of this week to hold a joint meeting of the two societies in New York and London. This epoch-making occurrence lent public as well as professional interest to the sixteenth winter convention of the A.I.E.E., held from Monday to Friday at the Engineering Societies Building. President Bancroft Gherardi, President F. B. Jewett and Colonel John J. Carty on the American side and President Archibald Page, Colonel T. F. Purves, of the British Post Office, and Sir Oliver Lodge on the English side exchanged greetings and indulged in spoken international amenities that were heard clearly in both countries.

When Harry P. Charlesworth, plant engineer with the American Telephone & Telegraph Company, had announced that all was in readiness, Mr. Gherardi spoke into the transmitter, saying, "Good morning, Mr. Page," to which Mr. Page responded, "Good afternoon, Mr. Gherardi." Mr. Gherardi then asked Mr. Page to preside over the joint meeting. Taking the chair in London, the British president asked the American to address the meeting. Mr. Gherardi did so briefly and Dr. Jewett and Colonel Purves followed him. Then John J. Carty moved a resolution expressing deep satisfaction with the joint session and giving form to the idea that the two societies should become jointly an agency for international good will. Mr. Page called on Sir Oliver Lodge to second the resolution, which he did felicitously. After the motion had been enthusiastically carried, Mr. Page made a few further remarks, Mr. Gherardi thanked him for presiding, and the session, which had lasted a little more than half an hour, was declared over. More than a thousand persons crowded the New York meeting, while five hundred in an overflow meeting in another room also listened to the proceedings, and a similar overflow meeting was reported from London. Just previous to the session motion pictures depicting the method of transmission were shown at both conventions.

The transatlantic messages were an interlude between the papers of the session on communication—two of these preceding and two following it.

### Electrophysical Sessions

Sessions of the convention opened on Monday afternoon, when papers dealing with electrophysics and dielectrics were presented. These, as well as all the papers of the subsequent sessions, will be briefly abstracted, with a report of the discussions, in next week's Electrical World. The warmest discussion on Monday was aroused by the paper of two Russian engineers, Alexander Smouroff and Leo Mashkileison, on an investigation into the influence of internal vacua and ionization on the life duration of paper-insulated high-tension cables. This paper was read by William Del Mar, the authors having transmitted it from Leningrad. Those who discussed it held that its conclusions were somewhat invalidated by the circumstance that the tests were performed upon cable of poor quality in comparison with American standards.

### Interconnection a Chief Topic

Interconnection experiences furnished the subject of an entire session on Tuesday morning, and so well were these presented that one speaker declared, amid apparent general agreement, that the papers formed the "best national presentation of the subject ever made." Four well-known engineers—the late W. C. L. Eglin (whose paper was read by Nevin E. Funk), W. E. Mitchell, H. B. Gear and P. M. Downing—covered respectively the interconnection situation in the Middle Atlantic States, the Southeast, the Chicago district and on the Pacific Coast. Nine other authorities in the utility field took part in the discussion.

On Tuesday afternoon one event was a lecture by Dr. Harold Norinder of Sweden on the use of the cathode-ray oscillograph in the study of lightning and other surges on transmission lines. The speaker urged research in the United States along the lines indicated by him, his own researches having been in some degree academic on account of the comparative rarity of thunderstorms in Sweden. Several miscellaneous treatises were also presented at this session.

Wednesday was devoted to electrical machinery, with sessions both morning and afternoon. In the evening the Edison medal was presented to William D. Coolidge and the John Fritz medal to John J. Carty. The presentation ceremonies included an address by Dr. Michael I. Pupin, who outlined the achievements of Dr. Coolidge; the presentation of the Edison medal by President Gherardi and the response of the medalist; the announcement of the John Fritz medal award by Chairman J. V. W. Reynders of the board of award, an outline of the achievements of General Carty by Mr. Gherardi, the presentation of the John Fritz medal by Robert Ridgway, chairman of the board when the award was made, and the response of General Carty.

Inspection trips to plants of the metropolitan light and power companies, the studio of the National Broadcasting Company, the Electrical Testing Laboratories and the Bell Telephone Laboratories were held, most of them on Thursday afternoon. The annual dinner-dance took place Thursday evening at the Hotel Astor, with its usual success, and a "get-together" smoker was held Tuesday evening at the same hotel. Dr. W. F. G. Swann's lecture on "The Earth's Electrical Charge," delivered Monday evening, was a graphic discussion of the electronic theory in language understandable by the laymen as well as the technicians in his audience.

---

# Coolidge Describes His 900-Kv. Tube

*Experiments with Cathode-Ray Apparatus with Three Times the Power of That Demonstrated Two Years Ago Are Recounted*

IN HIS address of acceptance of the Edison medal, awarded to him "for his contributions to the incandescent electric lighting and the X-ray arts," on Wednesday evening Dr. W. D. Coolidge described a new 900,000-volt cathode-ray tube built by him with which experiments have just begun. This tube has three times the power of the 300,000-volt tube which he demonstrated in 1926. That produced enormous streams of high-speed electrons which changed gases into solids, caused many minerals to glow with phosphorescence for hours and caused profound alterations in living cells.

In his address Dr. Coolidge gave generous credit to his associates and forerunners in the work of developing high-power X-ray and cathode-ray tubes. Hitherto, he said, it had been impossible to construct tubes of very high voltage without puncturing the tube or getting the effect called the "runaway-arc discharge."

"More recently we have found that we can remove this limitation by subdividing the total potential difference applied to the tube between different pairs of tubular electrodes," he continued. "The electrons coming from the cathode are then given successive accelerations as they pass between successive pairs of electrodes. This in effect divides the tube up into sections, each of which may be good for as much as 300,000 volts. We have already successfully operated such a cathode-ray tube, with three sections, on 900,000 volts.

"This opens a vista of alluring scientific possibilities. It has tantalized us for years to think that we could not produce in the laboratory just as high-speed electrons as the highest velocity beta rays of radium and just as penetrating radiations as the shortest wavelength gamma rays from radium. According to Sir Ernest Rutherford, we need only a little more than twice the voltage which we have already employed to produce X-rays as penetrating as the most penetrating gamma rays from radium, and about 3,000,000 volts to produce as high-speed beta rays."

## Quebec Fights Ottawa

*Province Objects Strongly to Some of the Questions on Power Rights That Dominion Government Is Submitting to Canadian Supreme Court*

A NEW development in the water-power controversy in Canada is that the Province of Quebec has raised strong objection to the draft of questions which the Dominion government has drawn up for submission to the Supreme Court in an effort to secure a settlement of the differences which have arisen between the federal and provincial governments over power rights on navigable streams, particularly the St. Lawrence River. The matter of the rights of the provinces as against the Dominion has already been before the British Privy Council—court of last resort—and the provincial interpretation is that by its judgment the beds of the rivers belong to the provinces. The Ottawa government raises several points in this regard, however. It contends especially that the St. Lawrence is and always will be a navigable river and that other matters in connection with it are merely incidental.

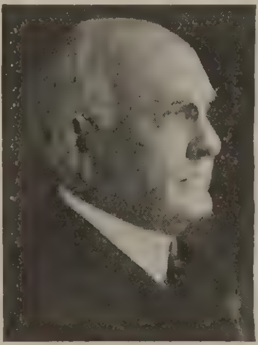
Considerable interest centers in the fight which is developing for the right to develop Quebec's share of St. Lawrence power. Three separate and distinct factions are believed to be clamoring for the power resources which will be developed if the St. Lawrence is deepened to the Great Lakes. The most imposing embraces what are termed the Holt interests—Montreal Light, Heat & Power, Shawinigan, etc. They are meeting competition from a newly formed group of Canadians headed by Frank P. Jones, who, it is stated, will emerge as president of the Beauharnois Power Company, which has an application before Parliament to build a combined shipway and power canal. Information in Ottawa is to the effect that the Beauharnois development is a minor step in an undertaking which is ready to invest hundreds of millions if the promoters are successful in acquiring rights. In this broader project the Sifton interests are believed to be concerned. The third factor in the situation is said to be a group of United States capitalists with unlimited backing. The weakness of their position is that they apparently are against a stone wall in the attitude of Premier Taschereau of Quebec as regards exportation of power from Quebec. However, there appears to be an impression in the capital now that international development of the St. Lawrence will include a broader policy with respect to exportation of power.

## Congressional Delay on Radio Said to Threaten Chaos

According to the National Association of Broadcasters, federal control of radio, and with it the whole structure on which broadcasting and the radio industry have been developed, is in imminent danger of collapse as a result of hesitation and delay in both houses of Congress. The association points out that although the Federal Radio Commission is supposed to consist of five members, at the present time Judge Sykes is the only member whose appointment has the seal of congressional approval. Commissioners Caldwell, Pickard and Lafount have not been confirmed, and no appointment has been made to fill the place of Admiral Bullard. If no action is taken by Congress by March 15, control will revert to the Department of Commerce, which, the association says, would have to build up a new and very extensive regional organization in order to deal with the problems still pending. The commission would on the date named become merely an appellate body. The continuation of the commission for another year, the confirmation of its members, the prompt appointment of a member from the second zone and the "removal of the threat of dishonorable discharge at the end of another year" are, the association declares, absolutely essential if radio broadcasting is not to return to the condition in which it was a year ago.

## Philadelphia Electric Has New President

### William H. Taylor Succeeds Walter H. Johnson, Who Becomes Assistant to Arthur W. Thompson, the New Chairman of the Board



W. H. JOHNSON

W. H. TAYLOR

A. W. THOMPSON

IMPORTANT changes in the officers of the Philadelphia Electric Company—the outcome of the consolidation of its interests with those of the United Gas Improvement Company, which has just gone into formal effect—were announced on Tuesday of this week after the monthly directors' meeting. William H. Taylor, vice-president in charge of operation and maintenance of the U.G.I., becomes president in succession to Walter H. Johnson. Arthur W. Thompson, president of the U.G.I., becomes chairman of the board, and Mr. Johnson is named as Mr. Thompson's assistant. The position of chairman has been vacant since the death of Joseph B. McCall. Mr. Taylor on his election to the presidency resigned as vice-president of the U.G.I.

Mr. Taylor, who is 48 years old, is a graduate of Stevens Institute of Technology and has been connected with the United Gas Improvement Company since 1903, serving in engineering and executive capacities in Omaha, Neb., Johnstown, N. Y., Charleston, S. C., Atlanta, Ga., and elsewhere. He became vice-president at Philadelphia a year ago.

In a statement to the press Mr. Taylor said: "With the hearty co-operation of the fine body of employees which has been built up for so many years by the late Joseph B. McCall and Mr. Johnson, I am confident that we shall be able to render a still higher standard of service to the consumers and the public. In its future operations the Philadelphia Electric Company will have the advice and counsel of the U.G.I. consulting organization and will be able to call upon the invaluable experience of Mr. Johnson, whose services to the company date back to the time of its organization in 1899."

Resolutions on the death of Vice-President W. C. L. Eglin, chief engineer of the Philadelphia Electric, were passed.

## St. Louis Company May Develop Osage River

The Union Electric Light & Power Company of St. Louis, Mo., has for several weeks been conducting a survey to ascertain whether it can profitably develop water power on the Osage River 6 miles above Bagnell, Mo. This is the site on which a federal permit was obtained by the Missouri Hydro-Electric Power Company, whose revived plans were referred to last week (page 325). An option on this company's rights has, it is understood, been obtained by Stone & Webster, who are in agreement upon terms for turning it over to the Union Electric. A definite decision on the project will, it is reported, be made within 60 days.

The project comprehends a dam 100

ft. high, creating a lake 100 miles long, and a power house with a capacity of 100,000 hp. The entire project would cost approximately $25,000,000. Louis H. Egan, president of the Union Electric, is quoted as saying that data so far compiled indicate that the cost of power generated on the Osage River and delivered to St. Louis would be approximately the same as the cost of power generated at the Cahokia plant of his company.

At Osceola, about 40 miles southwest of Bagnell, the Ozark Utilities Company has begun the construction of a dam near the junction of the Osage and the Sac, which, it is said, will supply power to 35 towns, besides making the Osage navigable for 30 miles and the Sac for 20 miles above Osceola. L. K. Green is behind the enterprise, in which $500,000 is being invested.

## Suggested Adjustment for Columbia Projects

Through the use of an amended application for water rights at "Z" Canyon, on Clark's Fork of the Columbia River, Hugh L. Cooper may expect permission from the State of Washington to proceed with plans for development of about 260,000 hp. at that point, subject to action of the Federal Power Commission. This statement was made at Spokane on Feb. 4. Mr. Cooper's application should ask the use of 7,000 sec.-ft. and an additional 1,500 sec.-ft. from the same source for 50 years, Ross K. Tiffany, State Hydraulic Engineer, was informed by the State Attorney-General's office. The "Z" Canyon project is close to the Canadian line and would entail construction of a dam 425 ft. high and 350 ft. long, the development to cost $17,600,000, it is estimated.

The Clark's Fork of the Columbia also would supply water to the Columbia Basin irrigation project at a dam at Albany Falls. Plans for the irrigation project would permit 7,000 sec.-ft. to pass after the project is developed. This accounts for the 50-year limitation on the 1,500 additional second-feet suggested for the Cooper application.

Recently the Spokane Lead & Zinc Company filed for water rights at Metaline Falls, on the same Clark's Fork of the Columbia, locally known as the Pend Oreille River. This application was confused with Cooper's in an item that appeared in these columns on Jan. 21. The site sought is a few miles upstream from "Z" Canyon and would be flooded by the Cooper development. This Metaline Falls development will be held up until final state and federal action is taken on the "Z" Canyon proposal, Eugene Logan, engineer, stated. Possibility of the mining company buying 50,000 hp. from the "Z" Canyon plant was expressed, that being the amount of power which the Metaline Falls development is designed for.

A hearing for the Federal Power Board on the "Z" Canyon proposal was called at Newport, Wash., for Feb. 16.

## Purchases and Mergers

*Immense North Atlantic Consolidation Talked Of—Insull Company Readjustments—Three Times Its Cost Bid for Kinston (N. C.) City Plant.*

NEWSPAPER reports, apparently not without foundation, which point to a coming union of the Consolidated Gas Company of New York City (with the New York Edison and its other metropolitan electrical subsidiaries), the Brooklyn Edison Company, the Brooklyn Union Gas Company and variously named smaller utilities in territory contiguous to Greater New York are attracting wide attention. Such a consolidation would itself, according to rumor, be only part of, or preliminary to, a gigantic amalgamation reaching from Philadelphia along the Atlantic Coast to New York City and north to Albany, and including all the largest groups in this stretch of territory. This possibility—involving rather a bankers' than an operators' negotiation—is discussed in more detail under "Financial and Statistical News" (page 377).

The National Electric Power Company, now an Insull property, makes two announcements concerning readjustment of Insull holdings which are of interest. The first is that the National Electric Power Company has acquired a substantial majority interest in the common stock of the New England Public Service Company, whose subsidiaries furnish electric service to an extensive territory in Maine, New Hampshire, Vermont and New York. The second is that the National Electric Power Company has disposed of its properties west of the Mississippi River to the Middle West Utilities Company of Chicago. These properties are the Northwestern Public Service Company, operating in 100 communities from the North Dakota line down into Nebraska; the Watertown (S. D.) Public Service Company; the Kansas Electric Power Company, operating in Lawrence, Parsons, Emporia, Leavenworth and other Kansas communities, and the Southwest Power Company, operating in Oklahoma and Arkansas.

When bids for the Kinston (N. C.) municipal electric plant were opened on Feb. 6 it was found that several bidders had offered more than $1,000,000. R. Livingston of New York and E. C. Gregory of Charlotte made the high bid—$1,357,000—agreeing also to construct a "white way" and other improvements. The City Council, however, accepted the Carolina Gas & Electric Company's bid of $1,271,000 and "extras," subject to approval of the voters at a special election. Messrs. Gregory and Livingston have protested. The plant cost about a third of the sum offered. The municipal ownership element is strong in Kinston, and it is by no means certain that the bid will be accepted, despite its size.

The Illinois Power & Light Corporation acquired seven small private companies and one municipal lighting plant in central Illinois last year, while the North American Light & Power Company, of which the Illinois Power & Light is a subsidiary, acquired two private concerns, serving four towns. The Weldon plant was the municipal concern acquired, this purchase having been made quite recently. The Cisco and Maroa Electric Light Companies, which maintained only distribution systems; the Bondville Electric Light Company and the Seymour & White Heath Electric Light Company, also distributors in the Champaign district, were acquired, and in the Bloomington section the Shirley Light & Power (serving Funk's Grove also), the Stanford Electric Light, Power & Heating Company and the Carlock Electric Light & Power, which also served Congersville and the Mackinaw Dells rural community, were taken over. The North American took over the Prather & Hill Electric Company, serving Sherman, Williamsville and Broadwell, and the Elkhart Electric Light Company.

The Public Service Commission of New Hampshire has approved the purchase of the Ossipee (N. H.) Water & Electric Company, by the Public Service Company of New Hampshire for $30,000.

## Is New York's "Great White Way" to Disappear?

At a meeting of the New York Section of the Illuminating Engineering Society on Feb. 9 E. G. B. Fox of the Edison Lamp Works of the General Electric Company at Harrison, speaking on "Electrical Advertising Activities," called attention to the fact that in New York City there is pending a restriction that will blot out all electric signs in the heart of the city, including a long section of Broadway north and south of Forty-second Street. Mr. Fox said that the number of illuminated signs in 1926 in the United States was 425,000. It was estimated that these signs contained about 22,000,000 sockets, that the average wattage per lamp was 17 and that revenue from these signs was $28,000,000. Increase in electrical advertising in 1927 should mean to the sign manufacturer a business of $15,000,000, he thought. Mr. Fox referred to the need for a model sign ordinance that will safeguard the public interest and give the electrical sign industry a solid foundation on which to build.

F. E. Carlson of the National Lamp Works of the General Electric Company, Cleveland, spoke on "Design, Methods and New Developments in Electrical Advertising." He illustrated his talk with a series of lantern slides.

W. J. Moore of the Society for Electrical Development referred to the central station's part in the sign business and cited the example of a company serving a town of 100,000 population which in 1922 added to its revenue from signs installed in that year the sum of $450. In 1927 the revenue from signs installed during that year was $40,000, and for 1928 a quota of $50,000 has been set. Mr. Moore said that this great increase was owing entirely to the attitude of the central-station company toward the sign business and was typical of what could be done by other companies

## Wisconsin Water Power

*Interim Committee of Legislature Will Begin Hearings Next Week—Forty-eight Undeveloped Hydro-Electric Sites Discovered*

PUBLIC hearings by the legislative interim committee which has been delegated to investigate the operations of the electrical industry in Wisconsin will, it is reported, begin on Feb. 23. Originally the committee intended only to investigate the practicability of taking over the water powers for the state, but it is understood that a decision to broaden the scope of the investigation has been reached.

There are now in Wisconsin 48 unused water-power sites, according to Alvin C. Reis of Madison, secretary of the committee. These are on the following streams and rivers: St. Croix, two sites; Namekagon, one; Chippewa, seven; Flambeau, ten; Red Cedar, four; Wisconsin, seven; Tomahawk, one; Wolf, five; Oconto, two; Peshtigo, four, and Menominee, five. In addition to these there are seven undeveloped sites on boundary streams of the state.

Mr. Reis, in discussing the work of his committee, pointed out that one of the most important phases of this question to his state is the decision of the United States Supreme Court sustaining the recapture clause of the Wisconsin law. This clause provides that a state may recapture a water-power site from a private corporation after a lapse of 30 years by paying the original franchise value. "This means," Mr. Reis said, "that the state can have a permanent water-power policy on a basis of a reasonable initial cost, the unearned increment going entirely to the state." After water-power sites shall have been recaptured by the state Mr. Reis believes the state could either lease them again to private companies with a proportionate increase of rates to accord with the increased value of the property or, under proper legislation, could operate them directly, just as cities operate their municipal waterworks. Although the recapture clause affects only those sites whose franchises have been in operation for 30 years, Mr. Reis said that other sites could be taken over by the state by condemnation. Such water-power sites would have to be paid for at their present valuation rather than at the value placed upon them at the time the franchises were granted.

Before the state can purchase such properties or launch upon an enterprise of state-owned power-producing companies, it will be necessary to have constitutional authority for such activity, Mr. Reis added, since there is a provision in the constitution which prohibits the state from expending money for or engaging in any work of internal improvement other than road and forest preserves. It was the intent of a joint resolution introduced at the last session of the Legislature by Mr. Reis to give the state authority to acquire, construct and maintain water-power plants for the furnishing of light, power and heat to the public. This resolution, although it passed the Assembly, was killed in the Senate. Two-thirds of the water power of the state is already under private or municipal control, according to him.

## Edison Pioneers Gather

*Early Associates of the Inventor Meet in New York to Celebrate His Eighty-first Birthday—Edward Dean Adams Elected President.*

ABOUT 150 persons—members of the Edison Pioneers, their families and friends—met at luncheon at the Hotel Astor, New York, on Saturday, Feb. 11, in celebration of the eighty-first anniversary of the birth of Thomas A. Edison and for the annual meeting of the society. From his winter home at Fort Myers, Fla., Mr. Edison sent this message:

"I am glad to hear from my old boys and appreciate your congratulations and good wishes. Regret I cannot be with you today, but have no doubt you will enjoy meeting each other again. I am having a fine time on my present job. Cordial regards to you all."

EDWARD D. ADAMS

W. H. Meadowcroft, historian and retiring president of the organization, presided at the luncheon and described the inventor's latest undertaking, which has for its aim the production of rubber from American-grown weeds, vines, shrubs and bushes.

Among those present at the luncheon were Edward D. Adams, W. S. Barstow, Charles L. Edgar, Thomas A. Edison, Jr., Charles Edison, C. E. Estabrook, W. J. Hammer, Joseph Insull, Francis Jehl, Walter H. Johnson, Peter Junkersfeld, Isaac Krall, John W. Lieb, W. S. Mallory, Preston S. Millar, F. A. Scheffler, F. A. Wardlaw, Theodore Beran, James Burke, Douglass Burnett, Adolph Hertz, J. J. Kennedy, A. W. Kiddle, Hermann Lemp, James Lyman, H. V. A. Parsell, Theodore Stebbins, C. W. Stone, W. G. Wetmore and Arthur Williams.

Edward Dean Adams, the veteran who played a leading part in the development of power at Niagara Falls, was elected president for the ensuing year; Sydney B. Paine, William H. Francis, Walter S. Mallory and Francis Jehl vice-presidents; **F. A.** Wardlaw secretary and Charles E. Estabrook treasurer.

## Illinois State Electric Association Meets March 14-15

The eighth annual joint convention of the Illinois State Electric, Illinois Electric Railways and Illinois Gas associations will be held at Springfield on March 14 and 15. Two general sessions in the mornings will take place at the Hotel Abraham Lincoln with addresses by presidents of the associations and others. In the afternoons the associations will meet separately, the State Electric Association assembling at the St. Nicholas Hotel to listen to reports and papers as follows:

### WEDNESDAY, MARCH 14

Report of industrial relations committee, Robert Hallenberg, Illinois Northern Utilities Company; "Street Lighting as a Source of Revenue," R. J. Malcomson, Public Service Company of Northern Illinois; "Residential Refixturing in Illinois — Present Status and Market," R. G. Raymond, Electric Association, Chicago.

### THURSDAY, MARCH 15

Final report on Illinois experimental farm line, Prof. E. H. Lehmann, University of Illinois; "Proposed Accounting in Connection with Farm Lines," J. Paul Clayton, Central Illinois Public Service Company; "Progress in Connection with Superpower Transmission Developments," E. S. Hight, Illinois Power & Light Corporation.

## Commonwealth Power Is to Spend $25,000,000 in 1928

Subsidiaries of the Commonwealth Power Corporation plan to spend approximately $25,000,000 in 1928 for additions and improvements. About 70 per cent will be for the electric department. The more important projects contemplated include immediate additions to the steam-electric generating stations at various points in the territory served. Preliminary work will be started on the construction of a new dam and hydro-electric installation on the Muskegon River in Michigan to have a capacity of 35,000 hp. This job when completed will be the largest hydro-electric development in Michigan. Large expenditures also will be made in Michigan, Tennessee, Ohio, Illinois and Indiana for substations, transmission and distribution lines and other equipment.

The operating subsidiaries of the Commonwealth Power Corporation include the Consumers Power Company, with headquarters in Jackson, Mich.; the Tennessee Electric Power Company, Chattanooga; the Ohio Edison Company, Springfield, Ohio; the Southern Indiana Gas & Electric Company, Evansville; the Central Illinois Light Company, Peoria; the Illinois Electric Power Company, East Peoria, and the Illinois Power Company, Springfield, Ill.

# Briefer News

TRANSMISSION EXTENSIONS IN TENNESSEE.—A 66,000-volt transmission line of the Jackson (Tenn.) Railway & Light Company between Brownsville and Ripley, Tenn., has just been completed, and work is starting on a 110,000-volt line from Memphis to Ripley.

BUFFALO GETTING RID OF HER GAS LAMPS.—Adam B. Gunn, superintendent of distribution of the Buffalo General Electric Company, says in a recent report that 3,510 electric street lamps were installed in Buffalo in 1927. The great majority of these were for new streets in the northern and eastern portions of the city. Buffalo gas lamps are being quickly converted to the electric type.

PROJECTED HYDRO PLANT FOR EEL RIVER, CALIF.—The Benbow Power Company has applied to the California Railroad Commission for authority to engage in the distribution of electric light and power in Humboldt and Mendocino Counties. The applicant proposes to construct a dam across the South Fork of the Eel River at a point approximately 2,600 ft. west of Benbow and to construct a hydro-electric power plant, but pending its construction to operate a Diesel-engine plant.

WELL-SALTED POLES APPEAL TO OREGON STOCK.—Range horses and cattle in southern Oregon are being supplied with rock salt at the expense of the California-Oregon Power Company in order that the stock may be allured away from the utility's transmission-line poles, which have been treated with a saline solution. The animals, discovering the salt on the poles, began chewing the wood, and considerable damage resulted before the company solved the problem by liberally salting the territory.

KENTUCKY LEGISLATURE MAY BROADCAST ITS PROCEEDINGS.—It is announced that a joint resolution will be introduced in the Kentucky General Assembly at the present session providing that $15,000 be appropriated and a commission of three, to serve without pay and to be appointed by the Governor, named for the purpose of installing and looking after a radio broadcasting station, to be used during the regular and special sessions of the Kentucky Legislature, by the House and Senate, to keep the public informed of what is being done at Frankfort.

SWEDEN HAS NEW ELECTRICAL PAPER.—The Association for Rational Utilization of Electricity has been founded in Sweden along lines corresponding in some ways to the Society for Electrical Development. It is backed by the Swedish national central-station and electrical-industrial associations and has begun the publication of an independent semi-popular electrical engineering paper called *Era,* an abbreviated form for *Tidskrift för Elektricitetens Rationella Användning.* Of this paper Edy Vilander is editor. Mr. Vilander spent several years in the United States, during part of which he was associated with Dr. A. E. Kennelly in laboratory experiments at Harvard University.

POTOMAC ELECTRIC COMPANY ORDERS ANOTHER 30,000-KW. UNIT.—The Bennings station of the Potomac Electric Company at Washington, D. C., is to have a second 30,000-kw. turbo-generator unit. It is to be of General Electric manufacture and will be identical in rating and steam conditions with the one installed last December.

NEBRASKA MUNICIPAL SYSTEM GOES ON LINES FROM GOVERNMENT PLANT.—The Gering (Neb.) municipally operated plant has abandoned the manufacture of electrical energy and contracted with the government for electricity from the irrigation dam at Guernsey, Wyo. This has been followed by a reduction in rates. Gering owns its distribution system and will hold its plant in reserve.

## *Coming Meetings*

**[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see ELECTRICAL WORLD for Jan. 7, page 80.]**

Northwest Electric Light and Power Association — Commercial Section, Portland, Ore., Feb. 20 and 21; Engineering Section, Spokane, Wash., March 8 and 9. Berkeley Snow, 1208 Spalding Building, Portland, Ore.

New Mexico Utilities Association—Albuquerque, N. M., Feb. 20-22. Arthur Prager, Albuquerque Gas & Electric Company, Albuquerque.

New England Central Station Associaciation of Power Engineers—Engineers' Club, Boston, Feb. 29. T. D. Bond, C. H. Tenney & Co., Boston.

American Institute of Electrical Engineers—St. Louis regional meeting, March 7-9; Baltimore regional meeting, April 17-19; New Haven regional meeting, May 9-11. F. L. Hutchinson, 33 West 39th St., New York.

Oklahoma Utilities Association—Mayo Hotel, Tulsa, March 13-15. E. F. McKay, 1020 Petroleum Bldg., Oklahoma City.

Illinois State Electric Association—Hotel Abraham Lincoln, March 14-15. R. V. Prather, 205 Illinois Mine Workers' Bldg., Springfield, Ill.

National Electrical Manufacturers' Association—Policies Division, Edgewater Beach Hotel, Chicago, March 14-16. S. N. Clarkson, 420 Lexington Ave., New York.

International Association of Electrical Inspectors—Madison, Wis., March 17-18. W. Wilke, 4211 Eiring Place, Milwaukee.

Maryland Utilities Association—Emerson Hotel, Baltimore, March 23. G. S. Williams, 1005 Continental Bldg., Baltimore.

Southwestern Division, N.E.L.A. — Edgewater Gulf Hotel, Biloxi, Miss., April 3-5. S. J. Ballinger, San Antonio Public Service Company, San Antonio, Tex.

Nebraska Section, N. E. L. A.—Omaha, April 4 and 5. T. E. Browne, 1527 Sharpe Bldg., Lincoln.

Southeastern Division, N. E. L. A.—Miami, Fla., April 11-14. C. M. Kilian, 207 Bona Allen Bldg., Atlanta.

American Electrochemical Society—Bridgeport, Conn., April 26-28. C. G. Fink, Columbia University, New York.

Missouri Association of Public Utilities—Jefferson City, April 26-28. F. D. Beardslee, 315 North Twelfth St., St. Louis.

Middle West Division, N.E.L.A.—Hotel Statler, St. Louis, May 9-11. T. A. Browne, 1519 O St., Lincoln, Neb.

CANADIAN NIAGARA POWER COMPANY BUILDING NEW OFFICES.—Work is progressing rapidly on a new office building for the Canadian Niagara Power Company at Fort Erie, Ontario. The building, which will be a short distance from the Canadian end of the new Peace Bridge, will probably be completed by March 1. Built in Spanish design and finished in stucco with stone trim and tile roof, it will give facilities for displaying electrical appliances and will also afford ample office space.

CENTRAL ILLINOIS PUBLIC SERVICE COMPANY TO CONNECT LINES WITH POWERTON.—The Central Illinois Public Service Company has obtained authority from the Illinois Commerce Commission to construct and operate a 33,000-volt transmission line in Fulton, Mason and Tazewell Counties connecting its present distributing system with the new power plant at Powerton. Principal lines will extend from Powerton to Canton and from Powerton to Havana.

MAYOR OF TOLEDO OPPOSES "EXTRAVAGANT" LIGHTING.—Declaring that to place two electric lamps on each pole in a system where the poles are 100 ft. apart is an extravagant use of public money, Mayor Jackson of Toledo, Ohio, has vetoed an ordinance for a "white way" on Monroe Street. He says that a single lamp to a pole is enough and that 282 lamps, as planned, are too many. "The city's street-lighting bill is now reaching a huge sum," the Mayor said, "and it is becoming a heavy burden upon the taxpayers of the city."

CINCINNATI RATE DISPUTE GOES TO SPECIAL MASTER.—Appointment of a special master to examine the suit brought by the Union Gas & Electric Company against the city of Cincinnati in regard to reduced rates for electricity, as imposed in a recently passed city ordinance (ELECTRICAL WORLD, Oct. 29, page 904), was agreed to by counsel representing both parties in the United States Court at Cincinnati last week. A great mass of data is to be examined, and no definite date for court hearing was set.

DIVIDED AUTHORITY OVER OREGON UTILITIES BRINGS SUGGESTED LEGISLATIVE REMEDY.—An amendment to the Oregon utilities commission code which will vest the department with authority to regulate and supervise utility financing, purchases, sales and mergers will again be recommended to the 1929 Legislature. Commissioner H. H. Corey has submitted this amendment at previous sessions, but the authority still rests in the hands of the State Corporation Commission as regards the extent of bond and stock issues. The Corporation Commissioner, however, favors a plan either to extend the authority of the regulatory department in regard to transfers and mergers of utility properties or to place the entire matter of financing under the direction of the Corporation Commission.

Litchfield (Conn.) Customers Get Optional Rates. — The Connecticut Public Utilities Commission has decided that a new rate schedule of the Litchfield Electric Light & Power Company shall be optional with customers, who may stay on the former schedule if they wish, and a petition to upset the new rates was withdrawn. The optional plan is to have a trial of one year.

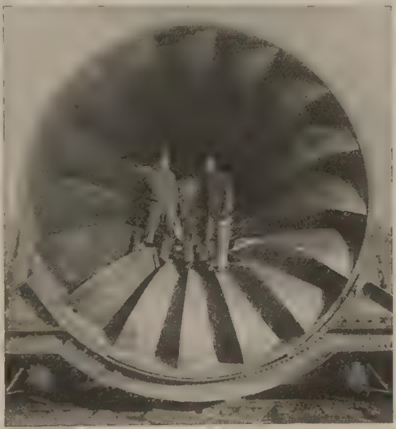
Houston Will Start "White Way" for Democrats.—Houston, Tex., is to install 88 new double-standard 2,000-cp. lamps on Main Street between Franklin and Polk Avenues in preparation for the National Democratic Convention, which will be held in the Texas city in June. This will give Houston a modern "white way" of an imposing kind.

Proposed 90-Mile Transmission Line in South Alabama.—The Alabama Power Company has authorized a right-of-way survey for the construction of a 90-mile power transmission line from Linden to Jackson, Ala., via Thomasville. The cost is estimated at $400,000. The company owns plants at both Thomasville and Jackson, but they have been isolated from its main power transmission system.

Southeastern Power Company Behind Savannah River Project?—According to a dispatch from Greenwood, S. C., the 120,000-hp. hydro-electric project of the Savannah River Electric Company, for which a license was granted in January by the Federal Power Commission, has the backing of the Southeastern Power Company, of which the Georgia Power and Alabama Power companies are subsidiaries. The site is at Clark's Hill, 15 miles above Ausgusta, Ga., where a 90-ft. dam will be built, forming a reservoir which will cover 40,000 acres.

Public Utility Commission Demanded for Texas. — Major Alfred Petsch of Fredericksburg, Tex., administration leader in the State Legislature, predicts that Governor Dan Moody will champion a measure to create a state public utility commission. "The most important economic matter to come before the Legislature will be the regulation of public utilities," Mr. Petsch says. "The Railroad Commission, hog-tied by constitutional limitations and personnel, is hopelessly inadequate. We must have a public utility commission which will have jurisdiction over all public utilities as the Railroad Commission now has over railroads. This is of supreme importance to the interests of the people and to the honest and fair utility. A constitutional amendment is the only solution of this question. There will be enough opposition in the Legislature by those utilities which, for various reasons best known to them, want no regulation at all to defeat the resolution in the Legislature unless the Governor champions the measure. It is safe to predict that the leadership of the Governor may be expected in favor of creating a public utility commission."

Shipping 16-Ft. Wheel from Philadelphia to the Tallassee.—One of the largest waterwheels to be cast, shipped and operated in one piece has been received at the Upper Tallassee hydro-electric development of the Alabama Power Company, now being reconstructed to produce 50,000 hp. The wheel, the first of two to be installed, weighs 130,000 lb. and required a special freight car for handling. Its largest diameter is 16 ft. and its extreme height is 10 ft. 3 in. Owing to its dimensions, the waterwheel, made by the I. P. Morris Corporation of Philadelphia, had to be shipped from Philadelphia to Cape Charles, Md., from there across the Chesapeake Bay by boat to Norfolk, Va., and thence by rail to Tallassee. This took seven days. It was in process of manufacture from early June until December.



University of Wisconsin to Conduct Its First Short Course in Electric Farming.—Third among American universities to conduct short courses in rural electrification, the University of Wisconsin held one on Feb. 14-16, in order further to promote the use of labor-saving devices on farms and in farm homes and to guide farmers in purchasing electrical equipment. University professors, light and power men and manufacturers' representatives took part in the discussions. The first of these courses was held last October at Purdue and the second was held on Jan. 23-28 at the Oregon State Agricultural College.

Erie (Pa.) Company to Be Advised by U.G.I. Officers.—An unusual contract has been signed by the United Gas Improvement Company and the Erie County (Pa.) Electric Company under which the U.G.I. will act as consultant and assist in the management of the Erie company, according to an announcement by Arthur W. Thompson, president of the U.G.I. This agreement, signed by Mr. Thompson and Charles H. Strong, president of the Erie County Electric Company, provides that the Erie company, which supplies power in that city and vicinity and is owned, operated and controlled by Erie citizens, shall receive the advice and assistance of U.G.I. management in the operation of the property, although that organization has no financial interest in the Erie property.

North Central Men Hold Meeting at St. Cloud, Minn.—About one hundred members attended a sectional conference of the North Central Electric Association at St. Cloud, Minn., on Feb. 15. Wheelock Whitney, Northern States Power Company manager at St. Cloud, was to preside. The program included illustrated lectures by C. P. Wagner of Minneapolis on "Developments in Rural Electrification" and by Secretary John W. Lapham on "Some Developments in the Electrical Industry." Round-table discussions covered the sale of electric cookery, better lighting and appliances and a general discussion on "Company and Dealer Co-operation," as well as a talk on reducing transmission losses by J. A. McCutcheon.

Manitoba Government Wants Seven Sisters Falls Site.—A complete survey of the water-power resources on the Winnipeg River and an estimate of the cost of development of the Seven Sisters Falls site in northern Manitoba, including, if necessary, expropriation of the Pinawa plant of the Winnipeg Electric Company, will be made by T. H. Hogg, chief hydraulic engineer of the Ontario Hydro-Electric Power Commission. This decision has been reached as a result of a conference between Mr. Hogg and members of the Manitoba government. Premier Bracken of Manitoba had wired the federal government urging that no lease of the power site at Seven Sisters Falls be granted to the Winnipeg Electric or any other company inasmuch as the provincial government plans to develop the site.

Transatlantic Television. — A demonstration of transatlantic television using apparatus invented by John L. Baird of England was made last week in the home of R. M. Hart, a short-wave radio operator in Hartsdale, N. Y., just outside New York City. The demonstration was witnessed at the American end by an Associated Press man, who reported that on a whirling screen, about 6 in. by 4 in., installed in Mr. Hart's cellar, two outlines of heads became visible as the result of the conjunction of innumerable points of light. In neither case could the features be clearly discerned, though it was said to be evident that one head was a man's and the other a woman's. Capt. O. G. Hutchinson, manager for Baird's company, was elated over the results and, it is said, predicted that with more power (only 2 kw. was available from the London station) transatlantic television would shortly approach perfection and that in a short time two-way television across the ocean would be a commonplace.

Quebec Utility Men Complain of Unfair Taxation Compared with Ontario Hydro.—An influential deputation from the Province of Quebec, consisting mainly of representatives of various public utility companies, waited upon the federal government in Ottawa on Jan. 11 and urged that users of privately owned electrical energy in Quebec be given the same immunity from taxation on its cost as is enjoyed by the users of publicly owned energy in Ontario. Several of the spokesmen deplored the advantage that Ontario had over Quebec in attracting United States industries and capital, when Ontario could tell them that they would not have to pay a tax on their electricity, while in Quebec the handicap in this respect amounted to $3 a year for every consumer of electric power. The Minister of Finance, replying, dwelt on the difference in the cost of power between the two provinces and appeared disinclined to remit the tax.

"Counted-Room" Rate to Be Introduced at Schenectady.—The Public Service Commission of New York has approved a new rate schedule of the New York Power & Light Corporation for electric service supplied in the Schenectady district. This schedule, effective March 1, provides for residential service on the "counted-room" basis. The rate is to be 25 cents per counted room per month (minimum three counted rooms), plus 5½ cents per kilowatt-hour for the first 10 kw.-hr. per month per counted room and 3 cents for excess consumption per month. A basis is provided for the determination of counted rooms. A "delayed-payment" excess of 2 per cent—but not less than 25 cents—is allowed. The present rate for residence lighting is 10 cents for the first 30 kw.-hr. and descending steps to 5 cents for all over 2,000 kw.-hr.

Water-Power Resources of Molalla River Basin, Oregon.—At five proposed power sites in the Molalla River Basin, Oregon, the potential power will amount to 38,900 hp. for 50 per cent of the time and 13,000 hp. for 90 per cent of the time, if the flow shall be regulated by the construction of the Pelkey Reservoir, according to a report by R. O. Helland made in connection with the classification of public lands by the Geological Survey, Department of the Interior. The report proposes a dam 260 ft. high at the Pelley site, which would make available 2,960 hp. for 90 per cent of the time and 4,830 hp. for 50 per cent of the time at 70 per cent efficiency. If the height of the dam were increased to 310 ft., it would double the storage and potential power. As Molalla River is close to Portland, power developed in the basin could be transmitted to that city at a low cost.

# Recent Court Decisions

"Willful Failure" to Observe Safety Rules Means More than Negligence.—In Knoxville Power & Light Company vs. Barnes, an appeal from an award under the workmen's compensation act, the Supreme Court of Tennessee, commenting on the contention that a workman's injury had resulted from refusal to use safety appliances furnished by his employer, drew a destinction between "willful failure" to do so and negligence founded on a false idea. The case in question was one where a lineman did not don rubber gloves because he had been told certain electric lines had been killed. The court found him entitled to compensation under the law. (299 S.W. 772).*

Where There Is Failure to Prove Contributory Negligence, Errors in Instruction on Such Negligence Are Without Prejudice.—The suit of Young vs. Vallejo Electric Light & Power Company, reported in the Electrical World for Nov. 26 (page 1114), came before the Supreme Court of California on appeal. Finding for the plaintiff was affirmed. The argument was on the matter of contributory negligence and the trial judge's instructions on the point. The Supreme Court held that the question was removed from the jury's consideration by the failure of the defendant to show the existence of such negligence and that, this being so, any errors in the judge's charge were immaterial. The case arose because of the transmission of electricity over wires resting on the roof of the plaintiff's house. (262 Pac. 327).

New Jersey Commission's Division of Territory Upheld.—The New Jersey Supreme Court has upheld the State Board of Public Utility Commissioners in fixing the territorial boundary line in the borough of Spring Lake for the supply of electrical energy as between the Jersey Central Power & Light Company and the Eastern New Jersey Power Company. In December, 1926, the board ruled that the two companies should divide the electric business of Spring Lake (Electrical World, Jan. 15, 1927, page 170). Spring Lake and the Eastern New Jersey Power Company attacked the ruling, the borough claiming that the utility board was attempting to control lighting of its streets and the power company contending that its property was being taken without due process of law. The Supreme Court held that these were unwarranted asumptions.

Doctrine of Trespass—Nervous Injuries a Cause for Recovering Damages.—The Supreme Court of Vermont reversed a directed verdict for defendant in Humphrey vs. Twin State Gas & Electric Company. In this case a temporary transmission line belonging to the company sagged owing to the breaking of a tie wire and made contact with a wire fence. The plaintiff and a companion, while on a hunting trip, trespassed on land traversed by the fence and the plaintiff was injured and the other man killed because of contact with the fence. The Supreme Court of Vermont held: (1) that there was a prima facie case for the jury under the doctrine of *res ipsa loquitur* (the thing speaks for itself); (2) that the fact of trespass on a third party's land did not absolve the company from liability; (3) that evidence to the effect that plaintiff on regaining consciousness was affected by seeing his companion dead was admissible both as proving the intensity of the electric shock and as showing a cause contributing to the disturbance of plaintiff's nervous system; (4) that plaintiff was entitled to recover for both physical injuries and nervous injuries occasioned by defendant's negligence. (139 At. 440).

Casually Placing Hand on Electrical Apparatus Exposed on Street Not Contributory Negligence.—In Johnson vs. East Texas Public Service Company the cutting of a guy wire by a telephone company had caused a short circuit which charged a hook used by the defendant, a light and power company, to raise and lower a street lamp. This hook was fastened on a pole six feet above the ground. While talking with another man on the street the plaintiff casually brought his hand into contact with the hook or the chain attached to it and was knocked down and severely injured. The Court of Civil Appeals of Texas sustained a judgment for damages, holding the plaintiff not guilty of contributory negligence. It also agreed in absolving the telephone company of responsibility, since two weeks elapsed between its severance of the guy wire and the accident, thus making any negligence by the telephone company antecedent and remote. The absence of strain insulators and the fact that there was plenty of time for the defendant company to have discovered and remedied the dangerous condition were ground for the jury's finding. (300 S.W. 975.)

# Commission Rulings

Meter Readers Must Not Enter Premises Without Occupants' Permission.—Meter readers for public utility companies do not have a right to enter any home in Kansas without first notifying the owner or occupant. This was the ruling of the Kansas Public Service Commission in a written communication to the Mayor of Haddam, who complained that meter readers for an electric light company carried skeleton keys and used them to enter homes at any time they were making rounds. Patrons of the company complained of this practice, and it was alleged that a local manager maintained that the readers had the right to enter a home at any time and without notice. The commission directed that meter readers give notice of their presence and that they must not enter homes without permission.

Adequate Service Insisted On.—Orders requiring the Dakota Public Service Company to take steps immediately to improve electric service furnished by it at Hettinger and Reeder have been issued by the North Dakota Board of Railroad Commissioners following a hearing at which citizens of the two cities detailed incidents of alleged poor service. It is the duty of a public utility to provide itself with adequate facilities for furnishing efficient service, the board said, and the company was instructed to install a new generating unit as quickly as possible, to improve the distribution service and to make weekly reports to the commission showing progress.

# News About Men of the Industry

H. J. Woodard has been appointed auditor of the Georgia Power Company, succeeding F. A. Brine, who retired on account of ill health.

Thomas Ahearn, president of the Ottawa Light, Heat & Power Company, has been made a member of the Canadian Privy Council, a high political honor.

Perry T. Knight of Valdosta has been appointed a member of the Georgia Public Service Commission to succeed the late O. R. Bennett.

Walter H. Smith has resigned from the Westinghouse Electric & Manufacturing Company, where he was connected with the railway equipment division, to join the engineering staff of the Reading Company in connection with the electrification of the Reading Terminal at Philadelphia.

Lester Hooker, senior member of the Virginia State Corporation, was named chairman of that body on Feb. 1. On that date William Meade Fletcher was sworn in as a member, succeeding Berkley D. Adams, who had been chairman for the previous two years.

E. W. Sweezy has been named president and general manager of the Suburban Light & Power Company, Cleveland, recently purchased by New York men through a transaction negotiated by Love, Macomber & Company of New York. Mr. Sweezy was formerly identified with public utility properties in Alliance, Ohio.

Unit Rasin, for the past fifteen years district manager of the Westinghouse Lamp Company in Philadelphia, has resigned. Mr. Rasin is well known in electrical manufacturing circles in the Philadelphia district, his sales work for the Westinghouse company having brought him in close contact not only with the jobbers and dealers but also with the industrial plants in that territory.

E. A. Armstrong, formerly power engineer of the Public Service Company of Northern Illinois, has been appointed manager of power sales. A graduate of Michigan Agricultural College in electrical engineering, Mr. Armstrong became associated with the Public Service Company in 1920 in the capacity of power salesman. It was in 1924 that he was appointed power engineer.

Albert H. Manwaring, who recently retired after 46 years of service with the Philadelphia Electric Company, was the guest of honor at a luncheon given by his fellow employees at the Penn Athletic Club. Among those present were Walter H. Johnson, president; A. B. Huey, H. P. Liversidge and W. E. Long, vice-presidents; A. V. R. Coe, secretary, and H. C. Lucas, treasurer. A. R. Granger, vice-president of the Delaware County Electric Company, subsidiary of the Philadelphia Electric Company, acted as toastmaster and on behalf of Mr. Manwaring's fellow workers presented to him an electrically operated radio.

## *J. A. Hunnewell New President of Lowell Utility*

John A. Hunnewell, whose election as president of the Lowell (Mass.) Electric Light Corporation was recently announced, is one of the best known resident managers of the East in the Stone & Webster group. He was born 50 years ago at Scarboro, Me., was educated at Bates College and shortly after graduation entered the employ of Stone & Webster. In 1906 he was made manager of the Lowell company and has been prominently identified with the growth of this organization and to a large extent responsible for its prosperity and good public relations, besides taking an active part in civic affairs. His interest in employees has been expressed in many ways, perhaps the most prominent of which has been in the personal conductorship for some years of an unusually fine orchestra composed of members of the Lowell company's rank and file. He was recently made vice-president of the Lowell Gas Light Company, but with the acquisition of the electric company by the New England Power Association he resigned from this post and severed his connection with the Stone & Webster organization.

J. A. HUNNEWELL

W. R. G. Baker has been appointed managing engineer of the radio department of the General Electric Company to succeed Adam Stein, Jr., who has joined the executive staff of the Acoustics Products Company. Mr. Baker has been in the employ of the General Electric Company for eleven years and he has been connected with the company's radio development work since 1918. He accompanied David Sarnoff, vice-president and general manager of the Radio Corporation of America, to Europe in 1924 to investigate the progress which had been made both in England and on the Continent in all fields of radio. Mr. Baker is a member of the American Institute of Electrical Engineers, the Institute of Radio Engineers and the National Electrical Manufacturers' Association.

John J. Albright, Jr., formerly district manager of the Niagara, Lockport & Ontario Power Company, at Olean, has been transferred in a similar capacity to Syracuse.

O. W. Bennett, assistant treasurer for the Blackstone Valley Gas & Electric Company at Pawtucket, R. I., for the last four years, has been made assistant comptroller of the Puget Sound Power Company, Seattle. Mr. Bennett will be succeeded at Pawtucket by John W. Kelly, now assistant treasurer of the Baton Rouge (La.) Electric Company.

C. P. Billings, after nine years' service in various capacities with the West Penn System of Pittsburgh, has resigned and joined the staff of the Electric Bond & Share Company at New York. Mr. Billings had served as vice-president and general manager of the Wheeling Traction Company, vice-president of the West Penn Company and vice-president of the West Virginia Power & Transmission Company.

Dr. E. F. W. Alexanderson, consulting engineer of the General Electric Company, was made the recipient of the John Ericsson medal by the American Society of Swedish Engineers for his outstanding contributions to the field of electrical engineering. The presentation was made Feb. 11 at a dinner which marked the fortieth anniversary of the Swedish Engineers' Society. Dr. Alexanderson, who recently demonstrated his developments in radio television, made a short address in which he commended the General Electric Company for providing the facilities and laboratories which have made his research work possible.

Cyrus S. Eaton, chairman of the board of directors of the United Light & Power Company, was recently elected a director of the Sherwin-Williams Company. For some years Mr. Eaton has been a prominent figure in the electrical industry, having entered the public utility field in the United States in its early stages, though a Canadian by birth. While still in his twenties, he organized and financed public utility properties in Ohio, forming the Continental Gas & Electric Corporation, of which he soon became chairman. Making his headquarters in Cleveland, Ohio, he extended the field of operation of the Continental company until in 1925 it was merged with the United Light & Power Company. In addition to holding the chairmanship of the board of the United Light & Power Company.

Mr. Eaton is also on the directorate of several other utility companies and industrial organizations.

R. T. Porter, formerly district superintendent of the Alabama Power Company at Decatur, is now identified with the Georgia Power Company.

E. C. Sorby, commercial manager of the Wisconsin Power & Light Company, Beloit, Wis., for the past two years, has joined the George D. Roper Corporation, Rockford, Ill.

Wendall P. Holman of Monticello, N. Y., has been appointed educational director of the Rockland Light & Power Company, the Rockland Electric Company and the Pike County Light & Power Company.

George Bartholomew, formerly connected with the Niagara, Lockport & Ontario Power Company at Cuba, N. Y., has been transferred to Olean in the capacity of commercial manager.

M. E. Hall has left Lancaster, Wis., for Decorah, Iowa, where he takes charge of Interstate Power Company interests for a wide territory. His place at Lancaster is taken by Charles Meyers of Bloomington.

J. E. Gargrave has been appointed manager of the Otter Tail Power Company at Aneta, N. D.

Richard Van Horn, an electrical engineer of the General Electric Company at New Haven, Conn., has been appointed engineer of the United Illuminating Company at Bridgeport and will assume his new duties March 1.

P. H. Powers, manager of the Keystone division of the West Penn Power Company, Pittsburgh, has been appointed commercial manager, effective March 1, in which capacity he will have charge of all activities of the commercial department. H. F. Smiddy will on the same date become an assistant commercial manager. K. G. Fuller will succeed Mr. Powers as manager of the Keystone division about Feb. 15.

William G. Keay, formerly New England sales manager of the Eureka Vacuum Cleaner Company and more recently sales representative of the Premier Vacuum Cleaner Company in the same territory, has been appointed merchandising manager of the Associated Gas & Electric Company properties in New England, with headquarters at Cambridge, Mass.

Frederick W. Brierly, superintendent of the Bridgeport (Conn.) division of the United Illuminating Company for 36 years, has tendered his resignation, effective July 1, and will be succeeded by Walter A. Upham, at present assistant superintendent. Mr. Brierly plans a long vacation in California. He has been associated with the electrical industry for 50 years, going to Bridgeport from the Union Electric Company, Worcester. He designed the Steelpoint station at the foot of East Main Street, Bridgeport, which was put in operation last year, and substations at Bridgeport, Fairfield and Milford. Mr. Upham was with the Pennsylvania Edison Company at Easton, Pa., before going to Bridgeport and is a graduate of Norwich University.

## *M. DeMerit Named Assistant to President*

Merrill DeMerit, distribution manager of the West Penn Power Company since December, 1926, has been appointed assistant to the president of that company. Mr. DeMerit affiliated himself with the West Penn Power organization in 1922 and he served until 1926 in the capacity of distribution engineer. In the course of his engineering career he has always devoted special attention to distribution and the knowledge obtained he used in revamping the West Penn Power Company's distribution system.

Mr. DeMerit was connected with the distribution engineering department of the Detroit Edison Company before transferring his interests to Pittsburgh.

MERRILL DEMERIT

A graduate of the University of Wisconsin, he entered the General Electric Company test course and subsequently affiliated himself with the Wagner Electric Company, St. Louis, engaging in meter manufacturing and inspection. Mr. DeMerit is active in association work, being a member of the overhead systems committee of the National Electric Light Association and of the Pennsylvania Electrical Association.

Harold R. Waldron has been made district manager of the Niagara, Lockport & Ontario Power Company in the Chautauqua division; Joseph H. Milbyer, superintendent; J. A. Parker, assistant superintendent, and Frank W. Bullock, commercial manager.

S. H. Osterhoudt, formerly superintendent of the Associated Gas & Electric interests at Liberty, N. Y., has been transferred to the Harlem Valley territory as superintendent of the Brewster district.

John P. Hannon, who has been with the Connecticut Light & Power Company for 21 years, has been appointed manager of the Branford (Conn.) district. Mr. Hannon started as a meter reader in 1907 and obtained his technical education through night study. In 1921 he became head of the test department at Waterbury and soon after was engineer and assistant manager at New Britain, and later division engineer.

C. E. Stephens, Northeastern sales manager of the Westinghouse Electric & Manufacturing Company, has been elected president of the New York chapter of the company's Veteran Employees' Association. The association is composed of employees in all parts of the country who have been with the company twenty years or more.

Floyd F. McCammon, for the last eleven years manager of power sales of the Public Service Company of Colorado, Denver, has been appointed assistant general superintendent of the company, effective Feb. 1. Mr. McCammon, a bachelor of science in electrical engineering, has been associated with Public Service Company since his graduation from Colorado College in 1916. It was at that time that he entered the company as junior engineer. Later he served in the United States Navy as ensign in the engineering division, and upon his return to Denver in July, 1919, he again became associated with the company as general engineer. In August, 1920, he was appointed power sales engineer, which position he held until his recent promotion.

D. F. Miner has recently been appointed manager of the material and process engineering department of the Westinghouse Electric & Manufacturing Company. Mr. Miner was first employed by the company in 1919 as an assistant to the section engineer of the electrical section. Since 1920 he has served as section engineer of the experimental section of the material and process engineering department. Mr. Miner was born at Hazarville, Conn., in 1892 and is a graduate of Clark College, Worcester, Mass. He is a member of the American Institute of Electrical Engineers and has spoken before that body and other engineering groups on the subject of high-voltage tests, in which he has utilized voltages of 1,000,000.

Prof. J. A. Fleming, honorary member of the Institution of Electrical Engineers of Great Britain, has been selected by that society as the seventh recipient of the Faraday medal, which is awarded by the council of the institution not more frequently than once a year, either for notable scientific or industrial achievement in electrical engineering or for conspicuous services rendered to the advancement of electrical science, without restriction as regards nationality, country of residence or membership of the institution. Professor Fleming, who is well known as the inventor of an early radio tube, was professor of electrical engineering in the University of London from 1910 until his retirement in 1927 and has played a notable part in the development of a great many applications of electrical science.

# Financial and Statistical News

## Merger of New York Utilities Again Rumored Imminent

THE growth of banking influence in the utility field is expected to culminate shortly in the amalgamation of the public utilities of the New York area into the nation's second largest utility group. While official denial is given the rumor, the usual orgy of premature press reports insist that prolonged attempts to consolidate these properties are approaching fruition. It is beyond question that the stock market has been discounting some such merger for many months.

The properties that would naturally be involved are the Consolidated Gas System, Brooklyn Edison Company, Brooklyn Union Gas and Brooklyn Borough Gas Company. Rumor includes also the Long Island Lighting Company, Kings County Lighting Company and the Westchester County utilities. This group, in the aggregate, has assets of well over $1,000,000,000 and provides practically exclusive gas and electric service to an area including and extending well beyond the metropolitan area of Greater New York.

Recent acquisition by the Mellon interests of fairly large blocks of the stock of Consolidated Gas and Brooklyn Union Gas suggest that this powerful banking group will figure prominently in any agreement arrived at. It is rumored, moreover, that holdings of the Nicholas A. Brady group in Consolidated Gas and Brooklyn Edison have recently passed into the hands of interests affiliated with the Mellon and Morgan banking groups.

One feature of the suggested negotiations, details of which those interested naturally withhold until arrangements have been completed, is the logic of such a merger. The benefits of large scale consolidation in the utility field are amply demonstrated, and the fact that the proposed tie-up is of such enormous proportions follows inevitably from the fact that the area served is the world's largest metropolitan area. Furthermore, the trend in the New York area is certainly toward unified control of interborough affairs.

## Japanese Company Offers New Issue

First mortgage 6½ per cent gold bonds of the Nippon Electric Power Company, Ltd., were recently offered the investing public to the amount of $9,000,000, the price being 94 and interest, yielding more than 7 per cent. These bonds, dated Jan. 2, 1928, mature Jan. 1, 1953. The Nippon Electric Power Company is at present primarily a wholesaler of power, its principal customers being the Toho Electric Power Company; the Great Consolidated Electric Power Company; the Kyoto Electric Light Company; the Hokurliku Co-operative Electric Company, and the Osaka Municipal Electric Bureau.

## Customers Oversubscribe Stock Before Campaign

THE entire issue of 6 per cent preferred stock, series C, offered by the Rockville-Willimantic Lighting Company, Willimantic, Conn., to its customers, through its employees, was oversubscribed on Feb. 7, the day preceding that on which the company's customer-ownership campaign was officially scheduled to open.

The enthusiasm which was aroused among the employees at the educational and sales meetings which preceded the campaign and the gratifying response of the company's customers to the offering were responsible for the early oversubscription of the issue. The plan used in preparing for the campaign was furnished by P. H. Whiting & Company, Inc., New York, and representatives of that organization, in co-operation with the executives of the Rockford-Willimantic Lighting Company, conducted the educational and sales meetings and directed the employees' efforts in the early stages of the campaign.

## St. John River Power Increases Capital

Notice recently appeared in the government *Gazette* of the granting of supplementary letters patent, under the New Brunswick companies' act of 1916, to the St. John River Power Company, authorizing an increase in capitalization by the issue of $601,750 of preferred stock. The St. John River Power Company is a wholly owned subsidiary of the International Paper Company, formed for carrying on the hydro development at Grand Falls on the St. John River in New Brunswick.

GENERAL PUBLIC SERVICE INCREASES DIRECTORATE.—The following directors have been elected by the General Public Service Corporation, increasing the board membership from eleven to seventeen: Gordon H. Balch; C. E. Groesbeck, executive vice-president of the Electric Bond & Share Company; Edwin Gruhl, vice-president and general manager of the North American Company; Philip G. Mumford, president of the Commercial Solvents Corporation; Sigourney B. Olney, member of the law firm of Cullen & Dykman, and Thomas W. Streeter, chairman of the board of the Simms Petroleum Company.

## Cleveland Electric Net Up 10 Per Cent

An increased volume of business during 1927 allowed the Cleveland Electric Illuminating Company to show gross operating revenues for the year of $23,609,479, which is an increase of 7.1 per cent over 1926. Operating expenses were $12,257,458, a 4.7 per cent increase. This allowed for an advance of approximately 10 per cent in net operating revenues, which were $11,352,021 last year.

| | Twelve-Month Period Ended | |
|---|---|---|
| | Dec. 31, 1927 | Dec. 31, 1926 |
| Gross earnings............ | $23,609,479 | $22,048,267 |
| Operating expenses...... | 12,257,458 | 11,704,563 |
| Net operating revenues..... | 11,352,021 | 10,343,704 |
| Non-operating revenues.... | 540,411 | 490,185 |
| Gross income........... | $11,892,432 | $10,833,889 |
| Deductions | | |
| Interest................ | 2,360,286 | 1,766,993 |
| Taxes.................. | 3,006,000 | 2,739,000 |
| Amortization of discount on debt.............. | 90,872 | 88,948 |
| Sinking fund requirements | 242,875 | 242,874 |
| Total deductions........ | 5,700,034 | 4,837,817 |
| Net income............... | 6,192,398 | 5,996,072 |

The company's maximum load for the year 1927 was 293,731 kw., an increase of 2.3 per cent over the maximum load for 1926. The year's operation showed 1,174,676,925 kw.-hr. generated, which is a 5.1 per cent increase over 1926. The total number of consumers at the end of 1927 was 282,441, an increase of 3.6 per cent during the year. There were 158 new industrial and commercial consumers, each having a load in excess of 25 kw.

A statement of the company's earnings in comparison with those of 1926 is given in the accompanying table.

PUGET SOUND COMPANY TO ISSUE STOCK.—The Puget Sound Power & Light Company has filed with the Massachusetts Commissioner of Corporations a notice of the issuance of 20,000 shares of no par preferred stock. Payments on the shares are to be made as follows: 5,000 shares at not less than $91 a share, 5,000 shares at not less than $92 a share, 5,000 shares at not less than $93 a share and 5,000 shares 1,174,676,926 kw.-hr. generated, which

MONTREAL LIGHT REPORT SHOWS RECORD EARNINGS FIGURE. — Montreal Light, Heat & Power Consolidated continued to make new earnings records in 1927, according to the annual report recently issued. Despite a marked increase in fixed charges, net income was well maintained, while one of the outstanding features of the report was a $6,000,000 increase in working capital position. The profit and loss account shows gross revenue amounting to $20,314,902, the highest figure yet reported, as compared with $18,907,382 in 1926. Operating expenses were $7,280,697, as against $7,109,819; taxes, $1,186,707, compared with $1,213,038, and depreciation, $2,031,490, compared with $1,890,738, leaving net revenue $9,816,006, an increase of practically $1,200,000.

EDISON COMPANY TO EXCHANGE STOCK. — The Southern California Edison Company, which is planning to purchase 2,000 shares of the common stock of the Ojai Power Company of Ventura County, proposes to give six shares of its series C 5½ per cent preferred stock for each share of the Ojai company stock.

# Brooklyn Edison Net Income Shows 10 Per Cent Rise

WHILE the annual report of the Brooklyn Edison Company, just issued, shows an extremely gratifying growth over the previous year, this growth is not so great as was the 1926 increase over 1925. Gross revenue increased 9 per cent, against an increase of 15 for the previous year. Net revenue increased 9 per cent over 1926, while the 1926 increase over 1925 was 18 per cent and the balance transferred to surplus showed a 9 per cent increase over the previous year, against 20 per cent the year before. These reductions are more or less indicative of industry conditions. They are not due to any great expansion in operating costs, since expenses, including taxes, maintenance and retirements, increased but 9 per cent over 1926, against the 13 per cent increase of that year over 1925. The fact, however, must be taken into account that the company made a voluntary reduction in the maximum rate for service from 7½ cents to 7 cents per kilowatt-hour, which resulted in a saving of about $1,400,000 to consumers during the year. This was the second general reduction in rates that has occurred in two years, and the two reductions together effected a total saving of more than $2,500,000.

The position of the company's surplus account indicates the exceedingly strong financial standing which has been achieved. Last year $2,167,132 was transferred to surplus, making a net increase in surplus of $2,440,934. Even with this increase earnings on common stock amounted to well over $11 a share, approximately the same as the amount earned in 1926, but the capital stock of the company was increased during the year from 750,000 to 1,000,000 shares at $100 par.

The company continues to pay 8 per cent on the common stock. The shareholders were invited to subscribe to

$15,000,000 par value, of the new stock and all of this amount was subscribed for and is being taken up.

### Steady Increase in Business

Owing to an aggressive business policy, the company has been able to increase the sale of current to a total last year of 754,635,691 kw.-hr., which is an increase of nearly 12 per cent over the previous year and an increase of approximately 70 per cent since 1923. It is anticipated that this will be greatly increased when the new Hudson Avenue generating station is ready for operation, some time next summer. This addition will bring the total capacity of the station up to 340,000 kw. and there are still three more units to be installed. As power is now generated at this station with less than 1 lb. of coal per kilowatt-hour the outlook for increased earnings is attractive, especially since operating costs are being exceedingly well regulated.

A study of these operating costs by items for the past year is illuminating: Taxes required 12.63 per cent of the total, or an amount of $4,700,000; wages took 25.7 per cent, coal 9.12 per cent and other operating expenses 11.21 per cent; interest and amortization costs were 6.8 per cent, dividends were 17.6 per cent, which figures out to 8 per cent on the capital stock outstanding at the time, and reserves and surplus amounted to 15.29 per cent. The balance of 1.4 per cent is going to the employees' profit-sharing plan. Taking the financial statement as a whole, there are few operating power and light companies in the country which show a stronger financial position and a more favorable future.

## New Capital Issues

First lien and collateral trust gold bonds, series A, of the Central Arkansas Public Service Corporation were offered to the public during the past week at 94½ and accrued interest, to yield about 5.45 per cent. This involved a total of $2,700,000. These bonds, dated Feb. 1, 1928, will mature Feb. 1, 1948.

The Alabama Power Company recently issued 20,000 shares of $5 cumulative preferred stock at $97.50 per share, the stock being fully paid and non-assessable.

Weymouth Company to Issue Stock.—The Massachusetts Department of Public Utilities has approved the issue by the company at $30 a share of 3,338 shares of additional capital stock, par $25.

# 1928 Opens with Materially Increased Production

### More Than Normal Seasonal Increase in Productive Operations During January — Practically all Industrial Groups Reported Materially Increased Operations

THAT the general feeling of business and industrial optimism which seems to pervade practically every section of the nation is based upon a solid foundation is borne out by data just made available upon general industrial production during January as indicated by the consumption of electrical energy. Reports of energy consumption during January made to ELECTRICAL WORLD by some 3,000 large manufacturing companies indicate that the rate of industrial production during January was about 9 per cent over that witnessed during December, after correction is made for the number of working days in the two months. This is about the rate of increase reported for January, 1927, over December, 1926, but is materially greater than the increase in rate of general production witnessed during the same month in 1923, 1924 and 1925. It would appear, therefore, that the current January witnessed increased productive activities over December on a scale slightly greater than that which would normally be expected for the month. It also appears from the basic data that American industry as a whole enters 1928 on a slightly higher plane than at the opening of 1927, the current January rate of activity being about 7.4 per cent over that reported for January last year.

Only three of the nation's primary industrial groups—food and kindred products, lumber and its products and paper and pulp—reported a rate of productive operations during January under those of December. On the other hand, the following basic industries reported the indicated increased rate of operations over December: Chemicals and allied products 14 per cent, rolling mills and steel plants 18 per cent, ferrous and non-ferrous metal working plants 16 per cent, leather and its products 14 per cent, rubber and its products 25 per cent, stone clay and glass 6 per cent, textiles 4 per cent and the automobile industry, including the manufacture of equipment and replacement parts, 27 per cent. These increased rates of productive operations during January indicate that American industry in practically all its branches felt a materially upward impulse as the year opened. An upward trend of considerable proportions is to be expected at this season of the year, but the fact that the impulse was felt by a very large proportion of the industrial groups instead of being confined largely to a few groups is a significant fact, offering an excellent basis for prognosticating a continuance of our present industrial prosperity at least through the first half of 1928.

## Conference on Refrigerator Standardization

A general conference of manufacturers, dealers and consumers to consider the standardization of refrigerators will be held in New York in March under the auspices of the American Engineering Standards Committee. A preliminary meeting was recently held to consider requests for standardization received by the committee from the American Home Economics Association and the American Institute of Architects. It was the view of both these bodies that specifications and standards which would tend to bring about improvements in food-keeping performance and ice economy of household refrigerators should be developed on a national scale under the auspices of the American Engineering Standards Committee, with the possible establishment of carefully defined grades of refrigerators.

All representatives at the preliminary conference were agreed that work along standardization lines was necessary, and that it should be accompanied by education of consumers to the proper selection and use of refrigerators. It was pointed out that the economic questions involved are too important to be neglected; for example, an extra inch of efficient insulation in a refrigerator will pay dividends at the rate of 18 per cent on a box used only six months out of a year. Several organizations will be invited to name delegates if the conference decides to initiate the work. As part of its effort to consider the point of view of all groups before undertaking the work the committee invites comment and suggestions on this project from all those interested in domestic refrigeration.

# Market Conditions

SALES in the New England district have decreased, motor business has dropped off and no equipment orders of special interest were reported. There is a marked upward trend in new building projects, with mercantile types predominant. Industrial inquiries in the Eastern market are better. The steel industry looms as an important consumer in the next 60 or 90 days. A steel company near Birmingham, Ala., placed an order for about $150,000 worth of equipment. No outstanding orders were placed in the Southeast, though the number of inquiries received was satisfactory. In the St. Louis district business is at a normal level. An oil refinery bought about $10,000 worth of motor apparatus, and a number of orders are being placed for line construction material. Industrial buying improved in the Middle West and utility companies continue to be busy with a large amount of construction work. On the Pacific Coast pole-line hardware sales are prominent, miscellaneous small telephone line jobs are reported in the Shasta and Diablo districts, and the Patterson irrigation project and the Turlock Irrigation District will soon be in the market for transmission line apparatus, pumps and motors.

## *Copper Steady with Tendency to Weaken—Lead Drops*

After ruling at 6½ cents for 2½ months the price of New York lead has been cut to 6.35 cents, tin continues its downward course, zinc has eased slightly, but copper prices are maintained with "primary" producers firm at 14⅛ cents Connecticut, despite shading on the part of custom smelters. Business has not been brisk in any of the metals, although the cut in lead stimulated some buying. The copper situation is much the same as it has been for a month or more, with a tendency to weaken. The tonnage sold is well below average.

NEW YORK METAL MARKET PRICES

| | Feb. 8, 1928 Cents per Pound | Feb. 15, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic.... | 14.075 | 14-14⅛ |
| Lead, Am. S. & R. price | 6½ | 6.35 |
| Antimony .. | 11 | 11 |
| Nickel, ingot.......... | 35 | 35 |
| Zinc spots............ | 6 | 5.92½ |
| Tin, Straits.......... | 53 | 51¼ |
| Aluminum, 99 per cent | 24.30 | 24.30 |

Base copper wire price Feb. 15, 1928, 15⅞ cents.

Predictions made two or three months ago that lead prices would advance before they would decline have proved to have been uninspired, for on Friday, Feb. 10, the American Smelting & Refining Company cut its contract price from 6½ cents, New York, at which level it had held since Dec. 1, to 6.35 cents. Other producers met the cut, and in fact, on Tuesday or Wednesday it might have been possible to shade this price by five points or so. The St. Louis market has also weakened. Producers are frankly uneasy over the drop in London, which has been largely accountable for the decline on this side. United States producers are not burdened with excess stocks, but the market cannot stand an inflow of bullion lead from foreign sources which would have eventuated had not prices been reduced as they have. Buying of lead has been fairly active since the prices dropped, with all classes of consumers in the market to some extent, and early delivery generally in most demand. Consumers have been buying tin on the breaks and traders have been selling. Forward prices are slightly less than prompt, but the difference is hardly more than ½ cent.

## *Inquiries Good in Southeast—No Outstanding Orders*

No outstanding orders were placed in the Southeast, though the number of inquiries received was satisfactory. Central-station companies are slow in starting to buy under the new budgets, but it is expected that the movement will shortly improve. A power company in Tennessee ordered high-tension insulators amounting to $15,000, while a Georgia company ordered three 667-kva. transformers and $13,000 worth of distribution and small power transformers. There is a very satisfactory amount of substation equipment business in more or less immediate prospect. Line construction materials are active, one company ordering weatherproof wire amounting to $12,000 and creosoted pine poles totaling $6,400. Another order in this line was for insulators, cross-arms and hardware amounting to $5,300. In a flatiron campaign just closed one of the larger central-station companies sold 5,620 irons in ten days.

Buying on the part of municipalities is more active than for some time past and is ahead of that usually noted for this period of the year. "White-way" equipment is active, three towns in Georgia ordering to the extent of $4,000, $3,500 and $3,000, respectively. Another town in the same state ordered line construction materials amounting to $1,000.

Construction projects are as follows: The Alabama, Tennessee & Northern Railroad Corporation plans terminal and repair shops at Mobile, Ala., to cost $250,000. Libby, McNeill & Libby, U. S. Stock Yards, Chicago, Ill., plans a milk condensory at Tuscaloosa, Ala., to cost $200,000. The Columbus Electric & Power Company, Columbus, Ga., plans a one-story substation on Tenth Avenue, to cost $40,000. The United States Foil Company, Louisville, Ky., plans a plant addition to cost $350,000. S. R. Morgan & Company, Little Rock, Ark., plans an ice plant at Aberdeen, Miss., to cost $100,000. The Mississippi Power & Light Company plans lighting and power system at Hickory Flat, Miss. The Powell Knitting Company, Spartanburg, S. C., will soon take bids for a new mill to cost $100,000. The Community Electric Company and the Blue Ridge Talc Company, Henry, Va., plan to rebuild their plants destroyed by fire with loss of $215,000. The Hooker-Bassett Furniture Company, Martinsville, Va., plans a new factory to cost $150,000. The Stanley Milling Company, Stanley, Va., plans rebuilding the portion of its mill destroyed by fire with loss of $150,000. The Appalachian Electric Power Company plans a substation at Madison, W. Va. The Kentucky Power Company, Brooksville, Ky., and the Carolina Power & Light Company plan extensions in transmission lines. Miami, Fla., and Portsmouth, Va., plan ornamental lighting systems.

## *Business in St. Louis at Normal Level*

Business in the St. Louis district is at a normal level. An order for sixteen 25-hp. motors with control, metering equipment and transformers was placed by a large oil refinery company and amounted to $10,000. A switchboard for $1,800 and another for $1,100 were sold to power companies in the south and western part of the district. The demand for stock sizes of motors and transformers shows slight improvement. Several orders are being placed for line construction material.

Construction projects are as follows: The North Arkansas Power Company, Mountain Home, Ark., plans a light and power plant at Salem, Ark.; also, an ice plant. The Arkansas Power & Light Company plans a 110,000-volt transmission line from Pine Bluff to Camden, Ark. Hannibal, Mo., plans extensions in its municipal power plant to cost $150,000. Kennett, Mo., plans a municipal power station to cost $30,000. Sweetwater, Tex., and Oakdale, La., will install ornamental lighting systems. The Thompson Can Company, Dallas, Tex., plans a new plant to cost $100,000.

## *Sales Volume Decreases in New England District*

A slight sag in the sales volume is noted in the New England district. Motor sales dropped off and no equipment orders of special interest were reported. Central-station supplies are moving very slowly, some interest in cable, wire and hardware is recorded and emergency repair orders for work in southern Vermont are being received in limited number. The Gloucester Electric Company recently purchased new switch and control equipment for replacement purposes. A number of small lot transformer orders is expected, but activity as a whole is lessening. A manufacturer of electric furnaces reports an order for a special type continuous feed heater. Industrial plant lighting is active and a Salem manufacturing company is planning its adoption on a large scale. Electric range sales are encouraging in the Maine and Vermont districts. In the former 90 ranges were sold recently.

New England shows a marked upward trend in new building projects, mercantile types predominating. A number of factory additions and changes are being planned. An ice plant, costing about $100,000, will be erected in Brockton, the Carver Cotton Gin Company plans a plant addition, several shoe and industrial plants are planning for an increase in power load and the General Motors Corporation is considering an assembly plant at Stoughton, Mass.

### *Industrial Inquiries Better in Eastern Market*

Industrial plant inquiries in the Eastern district point to early improved sales. The steel industry looms as an important consumer in the next 60 to 90 days. The improved operations in this field are leading not only to advance inquiries but immediate commitments. A steel company near Birmingham, Ala., has placed an order for a turbine unit, condenser and switchboard, totaling about $150,000, with a large manufacturer; the American Steel & Wire Company, Cleveland, is expected to buy a heavy amount of equipment, with an appropriation of $5,000,000, for extensions and improvements in Eastern and Western mills during 1928; the Sheffield Steel Corporation, Kansas City, Mo., is another prospective purchaser, with a fund of about $2,500,000, for plant expansion, including a new combination bar and rod mill, and the Southern Ornamental Iron Works, Dallas, Tex., will soon buy equipment for a plant at Arlington, Tex., to cost more than $200,000. Business in smaller industrial equipment, including fractional-horsepower motors shows tendencies for marked betterment. A manufacturer of automatic ticket registers has placed a contract for 1,500 motors of 1/50-hp. rating, totaling about $14,000; a producer of electric-operated coin counters has ordered 50 motors of 1/20 hp. at $700, and a manufacturer of compressors has contracted for 125 motors, divided in 1-hp. and 2-hp. sizes, at a cost of $4,000.

In the Philadelphia district manufacturers are encouraged by the advancing quota of inquiries, with industrial apparatus for new enterprises forming the largest percentage. Ice and cold storage plants in this territory, including southern New Jersey, will soon buy considerable machinery. Textile mills are coming into the market for motors and control equipment, and leather plants are showing expansion for early requirements.

Construction projects include the following: The Fur Merchant's Cold Storage Company, New York, plans a ten-story cold storage plant addition to cost about $300,000. The Rochester Gas & Electric Corporation, Rochester, N. Y., plans extensions in transmission lines in Monroe and Ontario Counties. The Riley Milk & Ice Company, Pitman, N. J., plans an addition to its ice and cold storage plant to cost about $100,000. The Bureau of Supplies and Accounts, Washington, D. C., will receive bids until Feb. 28 for lighting and power cable for the Philadelphia, Pa., navy yard (Schedule 8487); also, until Feb. 21, for one Diesel engine, air compressor, etc., for the Charleston navy yard (Schedule 8497). The Pennsylvania Water & Power Company, Holtwood, Pa., will call for bids on the initial unit of a hydro-electric plant at Safe Harbor, Susquehanna River. The Eastern Shore Public Service Company, Salisbury, Md., has acquired properties in Talbot, Caroline and Queen Anne Counties and contemplates extensions in transmission lines. The General Supply Committee, Washington, is asking bids until March 2 for electrical supplies for 1928 (Class 6), and the Maryland Paper Mills, Inc., will soon begin work on the first unit of its plant at Glen Burnie, Md., to cost $175,000.

### *Industrial Buying Improves in Middle West*

Business in the Middle West continues to improve. So far the year has been up to reasonable expectations. Building operations in the Chicago suburban districts are increasing. Industrial activity is steadily improving. Utility companies continue to be busy with a large amount of construction work and a great deal more is contemplated. Maintenance purchasing is quite large. Jobbers' sales are steadily improving, although some irregularities are noticeable. Appliances are moving fairly well. A jobber placed an order for 1,000 vacuum cleaners.

Construction projects are as follows: The Central States Power & Light Corporation, Dubuque, Iowa, has acquired the system of the Gladwin Light & Power Company, Gladwin, Mich., and plans expansion. Emmetsburg, Iowa, plans the installation of a municipal power plant. The Iowa Railway & Light Company will improve its power plant at Nevada, Iowa, to cost $30,000. Mountain Lake, Minn., plans a municipal electric distributing system. Louis P. Wolff, Globe Building, St. Paul, Minn., engineer, plans a municipal power plant at Detroit Lakes, Minn., to cost $32,000. The Hinde & Dauch Paper Company, Sandusky, Ohio, plans a new mill at Sullivan, Ill., to cost $100,000. The Willys-Overland Company, Toledo, Ohio, plans an addition to its plant to cost $700,000. The Great Atlantic & Pacific Tea Company, Milwaukee, Wis., plans an electric-operated baking plant to cost $200,000. Stoughton, Wis., plans a municipal power plant to cost $30,000. The Detroit Edison Company plans a 120,000-volt steel tower transmission line from its Trenton Channel power plant to Detroit, Mich. The Iowa Railway & Light Company plans a transmission line from Boone to Roland, Iowa, and rebuilding of line from Maxwell to Collins, Iowa. The Northwest Public Service Company plans a transmission line at Columbus, Neb., and the Nebraska Power Company at Valley, Richfield, Neb. Langdon, N. D., and North Milwaukee, Wis., will install ornamental lighting systems.

### *Pole-Line Hardware Sales Prominent on Pacific Coast*

Pole-line hardware purchasing has been active on the Pacific Coast. The Pacific Gas & Electric Company and the San Joaquin Light & Power Company being in the market for one car each and the Great Western Power Company for two cars. The latter company also purchased one carload of guy wire. Another power company purchased one carload of 11,000-volt insulators valued at $8,000. Miscellaneous small telephone line jobs are reported in the Shasta and Diablo districts. The Patterson irrigation project will require a total of 1,650 hp. of pumps and motors. The Turlock Irrigation District is requesting bids for construction of 14 miles of transmission line.

The city of Oakland, Calif., is in the market for 12,000 ft. of dredging cable, a lime company needs $2,500 worth of wiring material and ten assorted motors from 25 hp. to 100 hp., a new state fair building in Sacramento needs about $2,000 worth of reflectors and wiring material. The city of Los Angeles has purchased $19,000 worth of street-lighting transformers. New construction includes an administration building for the Fabiola hospital in Oakland to cost $700,000, and a million-dollar addition to the Olympic Club in San Francisco.

Electric range sales in Seattle during January showed a considerable decrease over those of December. Smaller appliance and table-ware sales are on the increase. Several substation transformers were purchased by the Puget Sound Power & Light Company for the Baker River and Seattle plants, fifteen motors from 25 hp. down to a lumber mill in Tacoma and about 30 from 50 hp. down for miscellaneous mill and woodworking plants in the Puget Sound district. Some sales of small motors to dealers in Grays Harbor and in eastern Washington are reported, but the volume was below the average.

Construction projects are as follows: The Benbow Power Company, Benbow, Calif., plans a hydro-electric plant on the Eel River, to cost $200,000. The Southern California Edison Company plans a 120,000-volt transmission line from Saticoy to its substation at Castiac, Calif., to cost $400,000. Los Angeles, Calif., plans a two-story substation on South Figueroa Street to cost $105,000. The Pacific Coast Steel Company, San Francisco, plans an addition to its plant to cost $500,000. The Great Northern Utilities Company plans a power plant at Shelby, Mont., to cost $300,000. The Utah Woolen Mills Company, Salt Lake City, plans a new mill to cost $175,000. Burbank, Monrovia, San Leandro and Whittier, Calif., plan ornamental lighting systems.

# Activities of the Trade

## Servel Elects Directors

At a meeting of Servel, Inc., the following directors were elected: Nicholas F. Brady, George W. Davison, William H. McCurdy, Ernst Aurell, Murray H. Coggeshall, C. A. Dana, Richard E. Forrest, W. S. Gray, Jr., Richard C. Hunt, John Higgins, George P. Smith, M. G. B. Whelpley and Col. Frank E. Smith.

## Edison Lamp Works Plans Merchandising Campaign

The "Out-in-Front" campaign, the third of a series of semi-annual merchandising drives, will be made by the Edison Lamp Works of the General Electric Company during the month of March. The campaigns have the two-fold object of educating agents to modern merchandising methods as well as to increase the sale of lamps. Better window and counter displays are the aim summed up in the slogan adopted and by means of which the company will stimulate its 15,000 agents to a nation-wide drive.

## Electric Refrigeration Elects Three New Directors

The Electric Refrigeration Corporation of Detroit at a recent meeting elected three new directors, as follows: Jules S. Bache, head of J. S. Bache & Company; D. B. Lee, chairman of the Motor Products Corporation, Detroit, and Harlan T. Pierpont, Springfield, Mass. At the meeting plans were laid to change the name of the corporation to the Kelvinator Corporation.

## Westinghouse Veterans Hold First Annual Dinner

The first annual dinner of the New York chapter of the Veteran Employees' Association of the Westinghouse Electric & Manufacturing Company was held at the Pennsylvania Hotel on Wednesday evening. This association, which has a membership of over 3,500, is made up of employees all over the country who have twenty or more years of service to their credit with the Westinghouse organization. There are fifty-five employees with forty years of service to their credit in this association.

C. E. Stephens, Northeastern sales manager of the company, who is president of the New York chapter of the association, presided at the meeting. After outlining the plans for the coming year, Mr. Stephens introduced E. H. Sniffin, who acted as toastmaster. Mr. Sniffin in turn introduced Walter P. Holcombe, vice-president of the Brooklyn Edison Company, who spoke to those in the banquet hall on "Veterans' Service." Another speaker was John J. Jackson, general attorney of the Westinghouse company, whose subject was "The Acid Test." Until this year those eligible in the New York district to join the association were affiliated with the Pittsburgh chapter, but during the last year so many in the New York office have joined this association it was deemed necessary to establish a New York Chapter. At a recent meeting, sixty chapter members were present. Officers elected at that time were: W. J. Massey, vice-president; Carl L. W. Baotz, secretary; C. V. Holmes, treasurer, and Miss C. C. Bickel, C. C. Bawden, and F. M. Garretson, trustees.

## First Allis-Chalmers Unit Started at Conowingo

The first of the four 54,000-hp. turbines built by the Allis-Chalmers Manufacturing Company, Milwaukee, for the Conowingo development on the Susquehanna River has been started. The immense size of these turbines will be apparent from the fact that the steel runner, or rotating part of each machine, weighs 100 tons, and that the valve admitting water to each turbine is 27 ft. in diameter. The Conowingo development forms one line in the chain of the system of the Philadelphia Electric Company. The project, one of the largest hydro-electric developments in the world, represents an investment of $52,000,000.

---

The W. R. Ostrander Electric Works, 911 Atlantic Avenue, Brooklyn, N. Y., has placed on the market a floor receptacle with a shallow box and a small diameter nozzle. It is designed for 250 volts, 10 amp.

The Central Flatiron Manufacturing Company, Johnson City, N. Y., announces the appointment of John W. Stiles & Son, Cleveland, as its representatives for the "Betsy Ross" line of electric appliances in Ohio, Indiana and Kentucky. The company also announces that the George W. Underhill Company, St. Louis, has been appointed representative in the states of Iowa, Nebraska, Oklahoma, Texas, Arkansas, Missouri and southern Illinois.

The McGill Manufacturing Company, Valparaiso, Ind., manufacturer of lamp guards, sockets, switches, etc., announces an improvement in its "Levolier," Cat. No. 61, fixture switch.

The Automatic Electric Heater Company, 1505 Race Street, Philadelphia, is offering a new line of water heaters equipped with a by-pass that will not allow any hot water to drip when house faucets become defective or are left partially closed.

The Steinmetz Heating Company, Inc., 30 Church Street, New York City, announces that it has been awarded a contract by the 963 Fifth Avenue Corporation, New York, for 60 flush-type wall insert electric heaters, "Globar" equipped, for use in the bathrooms of an apartment house.

The Benjamin Electric Manufacturing Company, 120 S. Sangamon Street, Chicago, has prepared a new reference wall chart which will enable the selection of the right type, size and catalog number of any Benjamin reflector or other industrial lighting equipment.

The American Electric Switch Corporation, Minerva, Ohio, announces the acquisition of the Nyelec Switchboard Company, 422 E. 53d Street, New York City. The Nyelec Switchboard Company will retain its New York office, factory and personnel and will operate as the Nyelec division of the American Electric Switch Corporation. The sales for the present will be handled by the American Electric Switch Corporation sales organization.

The Standard Electric Stove Company, Toledo, Ohio, announces that J. D. Behnke has been appointed district representative for western Missouri, Kansas, Oklahoma and southern Nebraska, with headquarters at Kansas City. Mr. Behnke formerly covered the same territory for the Commercial Electrical Supply Company of St. Louis.

The Bryant Electric Company, Bridgeport, Conn., has placed on the market its No. 782 expulsion type surface switch, built especially for inductive loads, for controlling three-phase alternating-current motors up to and including 2 hp. It is reversible triple-pole, with a rating of 20 amp., 250 volts or 10 amp., 600 volts.

The Trumbull-Vanderpoel Electric Manufacturing Company, Bantam, Conn., announces the appointment of Leighton B. Underwood as district sales manager in Philadelphia. L. B. Underwood & Company, of which Mr. Underwood has been head, was a manufacturers' representative, and has carried the Trumbull-Vanderpoel line of safety switches for many years.

The Lincoln Electric Company, Cleveland, announces the appointment of A. M. MacFarland as a general sales and development engineer, who will devote his efforts to the development and special application of automatic carbon arc welding, with headquarters at Cleveland.

The Wagner Electric Corporation, St. Louis, announces the opening of a new branch sales office at 475 West Peachtree Street, N.E., Atlanta, Ga., to cover the states of Georgia, Alabama and Florida, until recently a part of the St. Louis sales territory. Roy F. Druschky, who has been with the company for sixteen years and until recently a salesman in the St. Louis territory, has been put in charge of the Atlanta branch office.

The Hoover Company, North Canton, Ohio, maker of Hoover electric cleaners, is placing on the market a floor polishing attachment for use in connection with its various models.

# New Equipment Available

## Instrument and Control Switches

A new type of switch used for connecting any instrument or group of instruments selectively into various circuits as may be required for metering, synchronizing or other switching functions has been placed on the market by the Westinghouse Electric & Manufacturing Company. These switches are of the rotary type and are especially adapted to mounting in small space.

The switches are made in six standard lengths. The many combinations required are assembled from a relatively small number of standard segments and insulating arc-resisting spacers. All switches are insulated for 600-volt service for alternating or direct current. The contacts will carry 10 amp. continuously and will open 5 amp. under normal conditions. These switches can be mounted 3 in. apart horizontally and 5¼ in. vertically between center lines.

## Automatic Time Switch

A motor-operated automatic time switch for controlling alternating-current circuits where the load is less than 10 amp., has been placed on the market by the General Electric Company. This device will be designated as the T-8 switch, and may be used for the control of show-window lighting, electric signs, protective lights, and many industrial applications where circuits are required to operate regularly during a certain portion of each day. Two arms, registering on the revolving dial of the switch can be set at half-hour intervals to control the making and breaking of the load circuit, the maximum time interval being 11½ hours. The time keeping element of the switch is a small disk-type synchronous motor having a consumption of 3 watts.

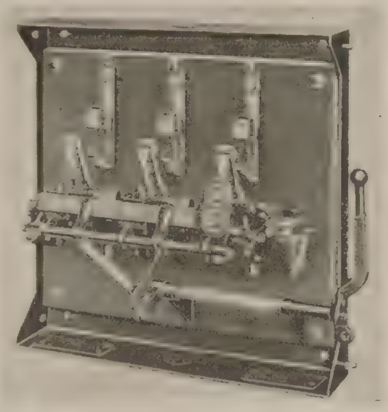
## Potheads

A new line of potheads has been added to the distribution products made by the Line Material Company, South Milwaukee, Wis. The potheads are so designed that any type may be assembled quickly from standard interchangeable parts. Owing to the type of design the company states that prompt delivery is insured on all orders. The potheads are made for indoor or outdoor service and for one, two, three or four conductors in any type such as side-entrance, flat-straight, 135-deg. angle, 90-deg. front entrance, tap-off type, bracket type, etc.

Secondary Rack.—A line of Peirce "Presteel" electro-welded secondary racks in both the heavy service and the light service types and which the manufacturer claims has greater strength per pound has been placed on the market by Hubbard & Company, Pittsburgh. In this line of racks there are no rivets, no pockets to hold moisture and no lapping of material to start rusting. The mounting holes on both the heavy service and light service racks have exactly the same spacing.

## Inclosed Circuit Breakers

A complete line of inclosed circuit breakers in capacities from 5 amp. to 800 amp. has been placed on the market by the Roller-Smith Company, 233 Broadway, New York City. The type ESF, shown in the illustration, is a free-handle breaker and the type ES, which is not of the free-handle type, has the handle projecting directly through a slot or slots, depending on the number of poles, in the front cover. These two types are for use on potentials up to 600 volts for direct or alternating-current service, are made with one, two, three, or four poles, with overload or undervoltage release or combinations and with instantaneous or time-limit trip. The type EF is made in capacities from 3 amp. to 100 amp. and is generally similar to the type ES except that the breaker itself is of the industrial type instead of the standard type. It does not have the fine finish of the ES line, but all parts are dipped and lacquered and they are built for hard use. They are for use on potentials up to 250 volts on direct or alternating current, are made for one, two, three or four-pole service, can be provided with overload or undervoltage release or combinations and have an instantaneous trip only.



TYPE ESF FREE-HANDLE CIRCUIT BREAKER WITH COVER REMOVED

With these circuit breakers the box can be installed first, if desired, and the breaker mounted at a later date. The box is so designed as to provide all safeguards against damage due to the explosion and liberation of gases that take place when a breaker opens under a heavy load. Changing a breaker can be easily accomplished.

## Centrifugal Air Compressors for Cupola Blowing

A cupola blowing equipment which it is claimed will greatly improve the efficiency of the melting operation has been developed by the General Electric Company. This equipment automatically insures the supply of a constant weight of air to the cupola, irrespective of atmospheric conditions and the resistance through the cupola. The new equipment will be manufactured with either hand or automatic control, and can be set to give the proper weight of oxygen to meet varying operating conditions. A meter indicates the volume of air flowing for standard conditions. Constant-speed motors are used with all sets, except when direct-current motors are required. As a result, the weight of air flowing into the cupola is not controlled by variable speed, but by opening and closing the blast gate.

## Hollow-Square Bus Support

A new line of bus-bar supports known as the modified hollow-square type and particularly adapted to heavy low-voltage bus construction has been developed by the Westinghouse Electric & Manufacturing Company. These supports consist of heat-treated aluminum alloy clamps which are insulated from the standard 1½-in. pipe of the mounting support by means of high-grade micarta tubes. The bus support is designed for 4-in. x ¼-in. bus bars and for a maximum of 4,000 volts alternating or direct current. The support may be adjusted to carry one or twelve bars so the bus may be tapered as feeders are tapped off or installation of additional bus copper to provide for an increasing load may be easily made.

Electric Mold Drying Unit.—An electric heating unit for drying large sand molds in brass, steel or iron foundries has been designed by the General Electric Company to obviate the attention required by the kerosene lamps, stoves or other fires usually employed. The device consists of a helicoil sheath-wire unit cast into iron. The terminals are protected by a cast-iron cap with an insulated hole in it, through which lead wires may be brought. The unit is designed to operate directly on the line voltage. It is rated 1,250 watts at either 110 volts or 220 volts. It has a shipping weight of approximately 10 lb., the over-all length is 21 in., length of heating surface, 18 in., width, 2¼ in., and thickness, 1 in.

Drum Switches.—Three new drum switches are announced by the General Electric Company for use with squirrel-cage and slip-ring motors. They have been designed particularly for the control of small cranes, hoists, machine tools, etc., but can be applied on any work where a small and inexpensive drum switch is desired for the control of the types of motors mentioned.

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued Jan. 31, 1928)

Reissue 16,865. Oil Refining Still and Method of Making the Same by Electric Welding; L. R. Smith, Milwaukee, Wis. App. filed Dec. 31, 1924.

1,657,452. Lightning Arrester; A. L. Atherton, Pittsburgh, Pa. App. filed Sept. 19, 1922. Multiple-gap type.

1,657,455. Trolley Base; L. F. Burnham, Pittsburgh, Pa. App. filed Nov. 5, 1925. Of the roller-bearing type for supporting current-collector members.

1,657,459. Circuit Closer for Electric Alarms; F. Davis, Brooklyn, N. Y. App. filed Nov. 15, 1924.

1,657,465. Electric Heating Unit; F. F. Forshee, Mansfield, Ohio. App. filed March 12, 1926.

1,657,479. Electric Heating Device; F. MacFarland, Wilkinsburg, Pa. App. filed Dec. 2, 1922. Flexible electric heater.

1,657,486. Switching Mechanism; W. M. Scott, Tredyffrin Township, Chester County, Pa. App. filed April 21, 1924.

1,657,492. Regulator System; C. A. Boddie, Wilkinsburg, Pa. App. filed Nov. 26, 1924. Actuated in accordance with a predetermined power factor of a supply circuit.

1,657,493: Testing Device and Method for Railway Traffic Controlling Apparatus; P. N. Bossart, Swissvale, Pa. App. filed July 13, 1926.

1,657,495. Mercury Arc Rectifier Starting Device; E. W. Breisch, Edgewood Park, Pa. App. filed Dec. 7, 1921.

1,657,507. Connecter; A. D. Keene, Pittsburgh, Pa. App. filed July 6, 1923. For electric resistance conductors.

1,657,513. Regulator System; W. E. Menzies, Irwin, Pa. App. filed June 14, 1923. For maintaining a number of machines at definite relative speeds that are variable at will.

1,657,521. Control System for Electric Ranges; V. G. Vaughan, Wilkinsburg, Pa. App. filed Nov. 5, 1923.

1,657,543. Primary Cell; R. B. Lynn, La Salle, N. Y. App. filed Feb. 9, 1926.

1,657,550. Method and Apparatus for Cooling Electrical Apparatus; G. W. Saathoff, South Orange, N. J. App. filed April 29, 1922.

1,657,581. Electrical Heating Apparatus for the Crucibles of Linotype Composing Machines; O. Mozzali, Treviglio, Italy. App. filed Oct. 23, 1922.

1,657,587. Electrical Pulse Generator; M. I. Pupin, Norfolk, Conn. App. filed Aug. 7, 1924.

1,657,617. Electric Clock Winding Mechanism; F. A. Feldkamp, Newark, N. J. App. filed Jan. 19, 1927.

1,657,638. Electrical Gas Igniting Device; E. L. Payne, Los Angeles, Calif. App. filed April 6, 1925.

1,657,643. Electric Heating Means; J. H. Reniers, Ben Avon, Pa. App. filed May 15, 1923. For stock such as rods, bars, wire, etc.

1,657,660. Electric Control for Sterilizers; F. Cedergren, Hammond, Ind. App. filed April 1, 1927.

1,657,671. Electric Furnace Terminal; F. A. Fitzgerald, Niagara Falls, N. Y. App. filed June 10, 1925.

1,657,677. Compensated Induction Motor; F. Kade, Kiel, Germany. App. filed March 26, 1924.

1,657,681. Safety Overload Device; I. E. McCabe, Chicago, Ill. App. filed Dec. 21, 1925. Thermostatic device.

1,657,688. Switching Mechanism; W. M. Scott, Tredyffrin Township, Chester Co., Pa. App. filed May 14, 1924.

1,657,714, 1,657,715. Switch Mechanism; T. E. Griffith and L. L. Dodds, Cleveland, Ohio. Apps. filed March 5, 1923. For use in elevator cars for breaking the operating circuit of the car upon the opening of the door of the elevator inclosure.

1,657,785. Electric Furnace; C. A. Calwell, Cleveland, Ohio. App. filed April 29, 1920. Of relatively high voltage.

1,657,794. Circuit Closer for Fluid-Level-Indicating Devices; M. S. Elton and G. E. Barnhart, Pasadena, Calif. App. filed Feb: 10, 1925.

1,657,799. Electrical Attachment Plug; L. Kellner, Chicago, Ill. App. filed Aug. 22, 1925.

1,657,808. Electric Heater; A. Steffen, Pittsburgh, Pa. App. filed Aug. 11, 1925. Wall heater.

1,657,855. Electrical Indicating Instrument and Control System Therefor; H. L. Decker, Toledo, Ohio. App. filed Oct. 7, 1925.

1,657,886. Direct Current Metering System; J. Harris, La Fayette, Ind. App. filed Jan. 24, 1925.

1,657,900. Closed Electric Machine; H. Richter, Behringersdorf, near Nuremberg, Germany. App. filed Nov. 7, 1925. Mine pump motor.

1,657,904. Electric Lighter; T. C. Russell, Chicago, Ill. App. filed Nov. 30, 1925.

1,657,910. Electrically-Operated Remote-Control Indicator; S. B. Allen, Framingham, and L. R. Sutherland, Boston, Mass. App. filed Sept. 11, 1922.

1,657,928. Ship Telegraph; W. R. Hornberger, Philadelphia, Pa. App. filed Aug. 27, 1921.

1,657,932. Electric Heater; P. Kukec, Chicago, Ill. App. filed July 12, 1927. Which may be installed in a boiler for generating steam.

1,657,933. Electrical Connecter; W. E. Lindsley, Brooklyn, N. Y. App. filed Feb. 15, 1927.,

1,657,948. Process in the Employment of Self-Baking Electrodes; J. Westly, Kristiansland, Norway. App. filed Jan. 5, 1925.

1,657,969. Electrical Cut-Off; E. W. Moon, Youngstown, N. Y. App. filed April 16, 1926.

1,657,970. Cone Coupling for Electrical Cables; E. Politi, Milan, Italy. App. filed Nov. 2, 1925.

1,658,010. Electric Switch; S. E. Skinner, New Britain, Conn. App. filed June 18, 1923. Switch having a plurality of terminals and means for electrically connecting the terminals in various combinations.

1,658,013. Mercury Switch; R. W. Armstrong and I. E. McCabe, Chicago, Ill. App. filed Dec. 16, 1922.

(Issued Feb. 7, 1928)

1,658,028. Armature Actuating Mechanism for Magnetos; P. Brown, Springfield, Mass. App. filed Jan. 28, 1928.

1,658,056. Electric Pressing or Forging Machine; G. H. Phelps, Warehouse Point, Conn. App. filed April 20, 1923.

1,658,071. 1,658,072. Electric Furnace; J L. Bernard, Beaver, Pa. Apps. filed Dec. 15, 1926. In which the tops or roofs may be removed for charging.

1,658,142. Electric Dry Battery; K. Stamm, Berlin-Dahlem, Germany. App. filed Feb. 9, 1925. In which the electrolyte is stored in a separate closed vessel of breakable material.

1,658,158. Device for Automatically Disconnecting Electric Circuits; O. Dreyer, Essen-on-the-Ruhr, Germany. App. filed July 4, 1925. In case of an overload.

1,658,160. Battery Terminal Clamp; C. Fisher, Chicago, Ill. App. filed March 24, 1927. For storage batteries.

1,658,194. Signal; R. S. Harter, West Nanticoke, Pa. App. filed March 24, 1924. For use at street crossings.

1,658,206. Lighting Fixture; G. Matthyssen, Inglewood, Calif. App. filed Oct. 22, 1925.

1,658,222. Electrocleaning; R. M. Burns, Brooklyn, N. Y. App. filed Feb. 10, 1925. Method of electro-cleaning metals.

1,658,237. Auxiliary Socket Connection; C. E. Godley, Detroit, Mich. App. filed Feb. 28, 1925. Means for affording a circuit connection from a wire terminal of a lamp socket or the like.

1,658,238. Compartmental Lamp; C. E. Godley, Detroit, Mich. App. filed Feb. 24, 1926. Means for partitioning the lamp casing, for supporting the lamp bulbs and for affording controlled circuit connections to the several bulbs.

1,658,242. Controller for Electric Motors; R. B. Hunter, Shorewood, Wis. App. filed July 6, 1926. For motor operated woodworking machines.

# New Trade Literature

LIGHTNING ARRESTERS. The Electric Service Supplies Company, Seventeenth and Cambria Streets, Philadelphia, is distributing booklet No. 246, the second of a series of booklets describing the technical features of the crystal valve lighting arrester as they apply to modern lightning protection.

MOTORS.—Bulletin No. 202 issued by the Reliance Electric & Engineering Company, Cleveland, describes and illustrates the type T, heavy-duty Reliance motors for direct-current with ball and roller bearings. The bulletin is well illustrated and covers the advantage of ball and roller bearings in the motors.

BOILER.—The Edge Moor Iron Company, Edge Moor, Del., has issued catalog No. 65 describing the Edge Moor cross drum boiler and giving the principal facts concerning it. The catalog contains a description of the operation and performance of the boiler and also contains many photographs illustrating both the design and the construction. Included at the end of the catalog are the suggested rules for the care of power boilers embodied as section 7 of the A. S. M. E. boiler construction code.

WATER COOLING EQUIPMENT.—The Cooling Tower Company, Inc., 15 John Street, New York City, is distributing bulletin No. 278, entitled "Cooling Water in the Modern Power Plant."

RAILROAD TURNTABLES. — Bulletin GEA-890 issued by the General Electric Company, Schenectady, N. Y., describes and illustrates its alternating and direct-current railroad turntables.

CABLE AND OUTDOOR STATION EQUIPMENT.—The General Electric Company, Schenectady, N. Y., has issued bulletin GEA-923, covering its impregnated paper-insulated cable. The company is also distributing bulletin GEA-856, describing and illustrating its type FA-1 disconnecting switches for outdoor station equipment.

VALVES.—Bulletin No. 89 issued by the Wellman-Seaver-Morgan Company, Cleveland, describes the Wellman "Supertest" gate and globe valves. Complete dimensional data on the various types are included.

CRANES. — The Whiting Corporation, Harvey, Ill., has issued bulletin No. 179, covering the operation and maintenance of Whiting electric cranes. Various illustrations show the construction of the different types of cranes.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

Purchase is desired in Hamburg, Germany (No. 29,577), of dishwashing machines.

Purchase is desired in Dresden, Germany (No. 29,602), of heaters, space, industrial; and ventilating equipment.

Purchase and agency are desired in Rome, Italy (No. 29,519), for heating and cooking equipment.

An agency is desired in Vancouver, Canada (No. 29,521), for household appliances.

Purchase is desired in Hamburg, Germany (No. 29,577), of refrigerators and electric shoe-shining machines.

Purchase is desired in Seville, Spain (No. 29,605), of wiring devices and electrical installations.

Purchase and agency are desired in Turin, Italy (No. 29,530), for air compressors, all types.

Purchase is desired in Dresden, Germany (No. 29,602), of furnace control instruments.

An agency is desired in Sao Paulo, Brazil (No. 29,514), for pumps, centrifugal and turbine outfits and smaller water turbines.

Trend of the Electrical Business

## The South's Rapid Increase in Customers

LIKE every other measure of the growth in the use of electricity in the United States, the number of consumers has shown an uninterrupted increase since the beginning of incandescent lighting, about 45 years ago. The first recorded count on a national basis was that of the census of electric light and power companies in 1907, a quarter of a century after the erection of the first plant. The number reported for that date was 1,946,979. Five years later it had increased by 97 per cent; the number added during the half decade ended with 1912 lacked but a trifle of being equal to the entire clientele acquired during all previous years. From 1912 to 1917 there was another huge increase, far greater numerically than between 1907 and 1912, but the ratio was somewhat smaller; it mounted to 87 per cent. This condition has continued: each five-year period has shown a larger numerical but smaller percentage than the one before: from 1917 to 1922 it was 77 per cent, and from 1922 to 1927 it was 71 per cent. Thus, as the residential users, who constitute about four-fifths of the entire number, come to approach—and in some localities to exceed—the number of families, it is to be expected that the increase will occur in successively smaller steps, not only relatively but absolutely. This apparently is already happening; for the past two or three years the annual gains, as closely as they could be determined by a careful survey, have been growing smaller. This is not surprising in view of the circumstance that the residential customers are already 63 per cent as numerous as the families in the United States as a whole, and in certain regions greatly exceed that ratio.

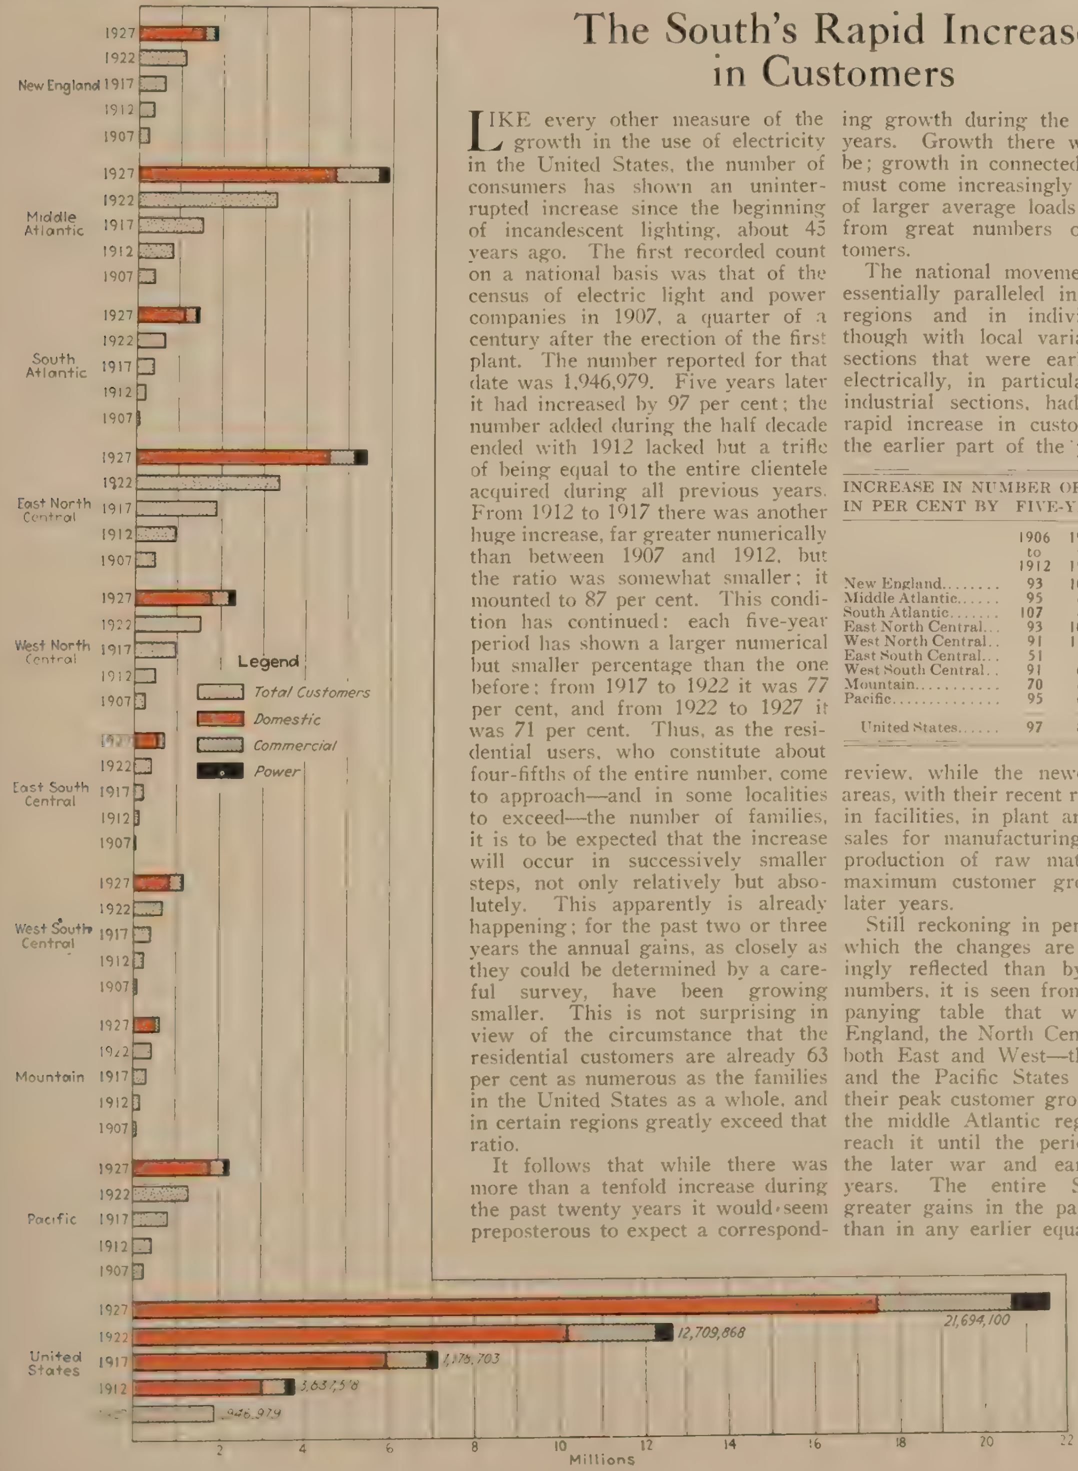
It follows that while there was more than a tenfold increase during the past twenty years it would seem preposterous to expect a corresponding growth during the next twenty years. Growth there will certainly be; growth in connected load, but it must come increasingly in the form of larger average loads rather than from great numbers of new customers.

The national movement has been essentially paralleled in the several regions and in individual states, though with local variations. The sections that were early developed electrically, in particular the older industrial sections, had their most rapid increase in customers during the earlier part of the period under review, while the newer industrial areas, with their recent rapid increase in facilities, in plant and in energy sales for manufacturing or for the production of raw materials, show maximum customer growth in the later years.

INCREASE IN NUMBER OF CUSTOMERS IN PER CENT BY FIVE-YEAR PERIODS

| | 1906 to 1912 | 1912 to 1917 | 1917 to 1922 | 1922 to 1927 |
|---|---|---|---|---|
| New England........ | 93 | 107 | 77 | 69 |
| Middle Atlantic...... | 95 | 85 | 112 | 83 |
| South Atlantic....... | 107 | 85 | 93 | 115 |
| East North Central... | 93 | 100 | 79 | 63 |
| West North Central.. | 91 | 119 | 58 | 43 |
| East South Central... | 51 | 72 | 90 | 91 |
| West South Central.. | 91 | 67 | 62 | 93 |
| Mountain........... | 70 | 85 | 32 | 37 |
| Pacific.............. | 95 | 61 | 71 | 67 |
| United States...... | 97 | 87 | 77 | 71 |

Still reckoning in percentages, by which the changes are more strikingly reflected than by the actual numbers, it is seen from the accompanying table that whereas New England, the North Central States—both East and West—the Mountain and the Pacific States had reached their peak customer growth by 1917, the middle Atlantic region did not reach it until the period including the later war and early post-war years. The entire South made greater gains in the past five years than in any earlier equal period.



*Customers by geographical divisions*

# 1927 Industrial Operations in the New England States 3 Per Cent Over 1926

REPORTS on the consumption of electrical energy by the manufacturing plants operating in the New England States indicate this was one of the few sections of the nation witnessing increased general industrial operations during 1927 as a whole, with an average monthly rate 2.9 per cent over 1926. This favorable condition was largely due to continued high rates of activity of the textile mills during the first ten months, reaching the peak in July, when operations were about 20 per cent over those recorded during July, 1926. The year closed, however, with textile operations about 19 per cent under July and 22 per cent under December, 1926, which influence resulted in an index of general industry during December about 17 per cent under December, 1926.

Compared with 1926 only two of the primary industrial groups—textiles and paper and pulp—reported a higher monthly average and only one—metals—closed the year 1927 on a higher plane. So that while the average monthly operations of New England industry as a whole during 1927 were over those of 1926, conditions in many of the individual industries during a large portion of the year were far from satisfactory.

*Indexes of Productive Activity in the New England States*
(All Figures Adjusted for Number of Working Days)

| | Dec., 1927 | Nov., 1927 | Dec., 1926 | Average for Full Year 1927 | Average for Full Year 1926 |
|---|---|---|---|---|---|
| All industries | 96.9 | 101.2 | 116.0 | 111.0 | 107.8 |
| Chemical and allied products | 88.8 | 92.2 | 97.8 | 112.6 | 118.7 |
| Leather and its products | 87.8 | 98.0 | 93.7 | 95.0 | 96.0 |
| Lumber and its products | 87.0 | 114.5 | | | |
| Metal industries group | 124.2 | 125.3 | 113.0 | 117.2 | 117.8 |
| Paper and pulp | 100.9 | 102.1 | 118.2 | 117.8 | 115.[illegible] |
| Rubber and its products | 93.2 | 112.0 | 101.5 | 110.7 | 111.5 |

## *Now for Defense and Vindication*

TO THE Federal Trade Commission has been given the task of investigating public utility and closely allied corporations. Senator Walsh's proposal for a senatorial inquiry has been denied and the industry spared the invective and calumny which the three-day debate in the Senate indicated would surely be heaped upon it had the original measure passed. Factual rather than sensational information ought, therefore, to be in order, and while the trade commission will be under pressure, the case against the utilities will, we have a right to expect, be conducted along judicial lines and not along the lines of prosecution. This outcome of the matter should be an occasion for congratulation but not for rejoicing, for the industry will be subjected to searching inquiry, and the desire of the commission to bring out all the facts will inevitably elicit much irrelevant, biased and misleading testimony which will be read by many who will not read that on the other side.

It is regrettable that passion instead of reason marked the debate in the Senate on the resolution and Senator George's amendment to it. Those who argued to place the investigation in the hands of the Federal Trade Commission were accused by inference of being bought by utility money; the trade commission itself was charged with incompetency and said to represent "big business" only, and as for the executives and others of the utility industries involved, they were all lobbyists. For three days the Senate debated without bringing out one constructive thought or any good reason, for that matter, why there should be an investigation at all. Senator Walsh presumably held back information, hoping at a proper time to startle the country. Others cluttered up the record with statistics on the comparative rates of municipal and privately owned generating stations, as though rates had anything to do with the question or even came within the purview and constitutional scope of the national government.

Obviously, from a utility angle the situation was anything but reassuring, and the Senate did well, in vindication of itself as well as in justice to the utilities, to turn the matter over to the Federal Trade Commission. There the complete story may be told—to a gathering, not partial to be sure, but at any rate to one not prejudiced —and the record can speak for itself. The utility companies of this country have made wonderful social and economic contributions—too great in fact to be ignored or lightly set aside. They are entitled to a fair hearing, and the submission of their case to the Federal Trade Commission would indicate that the Senate of the United States means that the utilities shall have it. When the case will end and what the final judgment is to be will be revealed in due season. The verdict should be one of exculpation and reassurance. No other outcome is thinkable if the case of the public utility companies is properly presented.

* * * *

## *High Lights of the A.I.E.E. Winter Convention*

GREATER interest even than usual was attracted to the winter convention of the American Institute of Electrical Engineers last week by the epochal joint radiotelephonic meeting with the British Institution and the presentation of both the Edison and the John Fritz medals. But even without these events the meeting would have ranked high among technical gatherings of recent years, and the Institute and the convention committee are to be congratulated upon it. No convention in the electrical industry has more value than this both to engineers who desire to be informed of current principles and practices and, in the case of some of the sessions, to men outside the fraternity, who can profit by the knowledge and force with which the engineers discuss many economic problems.

The meeting on interconnection was outstanding. The papers and discussions were good and many sound principles were stated, including words of caution about embarking upon schemes of interconnection without first making careful economic studies and hints that many interconnections cost more than they saved. Interconnection is a guarantee of service and is an insurance reserve which meets, for a minimum cost, the necessity for giving better electric service. But it costs money to improve service standards, and loose talking can be corrected if this fact is better understood. In the realm of lightning a good operating paper was presented by Philip Sporn, and Doctor Norinder gave hints of further technical progress. The instrument developed by Doctor Norinder apparently has many advantages for field surveys and, if used in this country, should bring out facts that will enable engineers to deal with insulation in tangible terms. Aside from some ideas of voltage magnitude, however, lightning still baffles the industry. Machinery and communication papers showed a steady advance in the art. The lecture of Doctor Swann and several scientific papers proved valuable and interesting. One of the encouraging trends was to find that engineers are attempting to discard the infinitesimal or mathematical method of analysis in favor of a basic work-and-energy approach to their problems. This means more complication, but the method deals with realities and not with assumptions made to satisfy the Maxwellian equations.

## *Two Coveted Medals Are Worthily Awarded*

BESTOWAL of the John Fritz medal upon General J. J. Carty of the American Telephone & Telegraph Company and of the Edison medal upon Dr. W. D. Coolidge of the research laboratory of the General Electric Company has met the hearty indorsement and approval of engineers and scientists everywhere. Few men have worked harder or longer in the service of electrical science than Carty and Coolidge, and although they labored in different fields, the first in telephony and the second in electrical research, both were worthy recipients of the great honor conferred on them.

As an original research worker and inventor Doctor Coolidge stands in the front rank of scientific men. While he has done magnificent work with the medical X-ray and high-voltage vacuum tube, he is probably best known to the world and to American electrical engineers in particular for his work on incandescent electric lamps with ductile-tungsten filaments. Nor is the Edison medal the only honor bestowed on him. Others besides the American Institute of Electrical Engineers have recognized his work. The Rumford medal was awarded him in 1914, and in 1926 he received the Howard N. Potts medal, and the Louis Edward Levy gold medal. Last year the Royal Society of London honored him with the Hughes medal and the American College of Radiology gave him a gold medal. Thus he is not a prophet without honor in his own country and in others.

Of the two medalists General Carty is the better known. As the organizer and head for many years of the great technical staff of the still greater American Telephone & Telegraph Company, General Carty has been responsible for the superior excellence of American telephone service. He is primarily an organizer, having inherited some of the stupendous ability of the late T. N. Vail, than whom telephony had no keener or greater leader. Honored by his own as well as by foreign governments, given doctor's degrees by nine colleges and universities, and possessing three medals in addition to that bearing the name of John Fritz, General Carty's standing in the world is firmly established. His work with the American Expeditionary Forces during the World War was of extraordinary value in organizing and maintaining the communication service that was such a vital factor in America's contribution to victory.

* * * *

## *Analysis of Disturbances Suggests Remedy*

ELIMINATION of transmission-line interruptions comes nearer to reality every time that an operating company makes a thorough study of its disturbances, analyzes the causes and endeavors through exchange of experience to prevent their recurrence or minimize their effects. A few such reports have been made public in the last year or so, notably those by Philip Sporn of the American Gas & Electric Company and J. G. Hemstreet of the Consumers Power Company.

When more companies overcome the fear that discussing interruptions will ruin their business and develop the courage to throw their experiences into a common melting pot, the day will be hastened when interruptions will not be considered so serious a problem. Such reports will help to confirm or disprove some of the ideas which have been developed, theoretically or in the laboratory. They will also bring forth factors that might otherwise be overlooked. In this field of investigation, as in others, the majority of companies should not expect to sit back and profit from the work of a few pioneers. To those who view the situation in perspective investigations behind closed doors usually result in retarded progress.

In the most recent report by Mr. Sporn (abstracted on page 411 of this issue) it is pointed out that experience has led to: (1) An extensive program of ground-wire installation with an increase in the number of such conductors at the terminals of lines to reduce the surge impedance from the last tower to the bus; (2) increased insulation of the line conductors except within a mile or so of the terminals, where the insulation is reduced to make certain that the insulating value of the station apparatus equals or exceeds the flashover value of the adjacent line insulation; (3) avoidance of tower extensions where feasible, or at least a net reduction in the average height of spans to minimize induced charges, and (4) more attention to arcing-protection arrangements, with a view to minimizing effects of conductor vibration on the protection assembly.

Conclusions from his former report have been confirmed, namely, that necessity exists for establishing a balance between tower height, span, lightning voltage, conductor spacing, insulators per string, insulation on terminal apparatus and clearances to ground; that lines of 44 kv. and over should have a ground wire unless the ground resistance is very high; that in no case should a ground wire be dismissed without consideration; that on high towers it is necessary to provide arc-protecting devices, and that lines should be so designed and relayed as to permit prompt disconnection in case of trouble.

Imagine the progress which could be achieved if more investigations of equal thoroughness were made and reported. For such studies adequate recording apparatus and means of checking the causes of any trouble are essential.

* * * *

## *Unshackle the Hands of the System Operator*

MANY valuable papers on technical and operating phases of interconnection have been presented by various authorities at various times and places. Probably not much new has been said on the subject in the last year. Nevertheless the symposium on energy interchange and the discussion which ensued at the winter convention of the A.I.E.E. last week deserve careful reading for several reasons. They stress the operating experiences, practices and problems, as distinguished from the technical phases, and thereby give attention to that side of the interconnection which if it be not successfully handled nullifies all plans and aspirations. They make available in one place the thoughts and experiences of more than a dozen authorities in the utility field. Better than one or two viewpoints, they enable any one to orient the relative importance of different problems.

By inference—but emphasis was needed—the fact was brought out that the most attractive paper plans for taking advantage of all species of diversity to minimize reserve capacity, stagger construction, provide emergency power and effect operating economies go for naught unless the operating man is able to cope with the various operating contingencies, contractual limitations, legal and political handicaps which at present arise on every hand. Charles L. Edgar apparently supported this view when he said, "Load dispatching is the heart of successful interconnection." With interconnection of financially independent systems there must be a give-and-take attitude in all relations, otherwise the aggregate benefits will not approach those possible under single management. W. E. Mitchell, P. M. Downing and H. B. Gear implied as much in their remarks. Proofs of this contention have become evident wherever interconnected systems have changed their attitude from that of self-interest to that of group interest.

When A. C. Marshall expressed a hope that interconnection agreements could be developed "that would not require joint interpretation by a Philadelphia lawyer and a Schenectady engineer," he voiced a widespread need for reform in interchange contracts. To this comment might be added the unwritten opinion of many load dispatchers—that most interconnection contracts are unworkable or at least serious deterrents to the realization of possible economies. Maintenance of service reliability on interconnected systems frequently operates against obtaining maximum economies, and for this reason further obstacles in the form of complicated or ironbound contracts should not be wedged into the already difficult task of system operators.

With the variety of interconnections which have been in operation for some time, there should be available experience which, if compiled, will give the answer to some operating problems still imperfectly handled. But the solution will not be forthcoming quickly unless engineers, operating men and executives individually present their problems and then jointly and frankly discuss their possible solution.

* * * *

## *Voices Across the Sea*

IN THE words of President Archibald Page of the Institution of Electrical Engineers at its joint meeting with the American Institute of Electrical Engineers on Feb. 16, during the winter convention of the latter, we are living in an age of "extraordinary progress." We are accustomed to this idea perhaps, but President Page could emphasize it with good reason on this occasion. Rarely has there been seen so vivid an example of the triumph of engineering skill and enterprise over the difficulties caused by our ignorance of nature's hidden secrets as was presented when at this meeting, by means of radio-telephonic communication, there were linked not only two continents, but two bodies of engineers in a joint meeting which offered freedom and easy means for mutual technical discussion.

O. B. Blackwell's lucid review of the essential elements in this latest triumph in the art of communication, made just before the transatlantic session, could not in its brief extent cover the multiplicity of examples of ingenuity and skill represented in the various special apparatus and combinations of electric circuit, any one of which could be held up for special admiration. But in such features as the use of long and of short waves to meet nature's changing conditions and the acoustic cutout for preventing interference between the sending and receiving stations on each side of the Atlantic, and in the economies in sending energy gained by single side-band transmission for the long waves and the special focus for a receiving antenna for the short waves, his description revealed a fine example of engineering research of the highest type.

Sir Oliver Lodge, speaking from London, pointed out as an essential element in all successful long-distance radio communication "nature's bounty" to man in confining the ether waves to a comparatively shallow envelope about the earth, rather than radiating them into space. Without this circumstance it is probable that this remarkable new means of interchange across the ocean would not be possible. It is not so long since electrical engineers assembled in a somewhat similar meeting to celebrate successful telephonic communication across our continent. What will be celebrated next? It is no great stretch of imagination—it is in fact a reasonably certain bet—that very soon men will not only hear one another in joint meeting across the Atlantic but will look into one another's faces as they speak.

When joint sessions of such widely separated gatherings are extensively feasible what a wonderful power will be available for removing the misunderstandings that now result in international friction and constantly tend to cause war!

* * * *

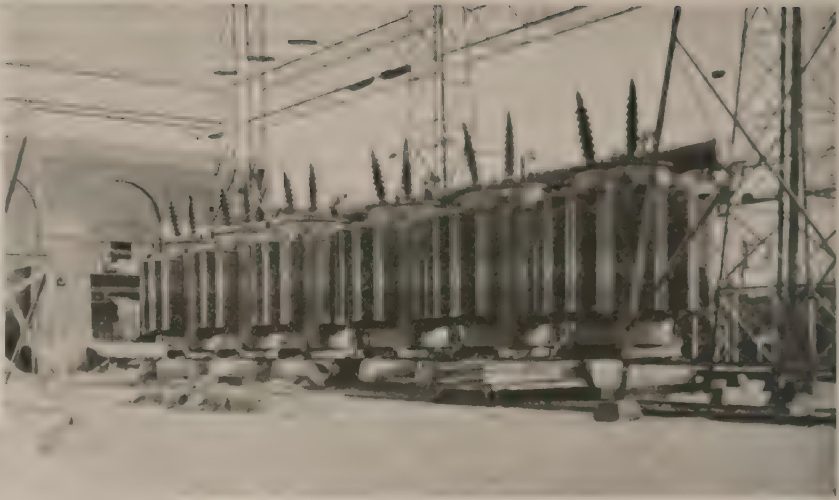
## *The Significance of the Harvard Advertising Award*

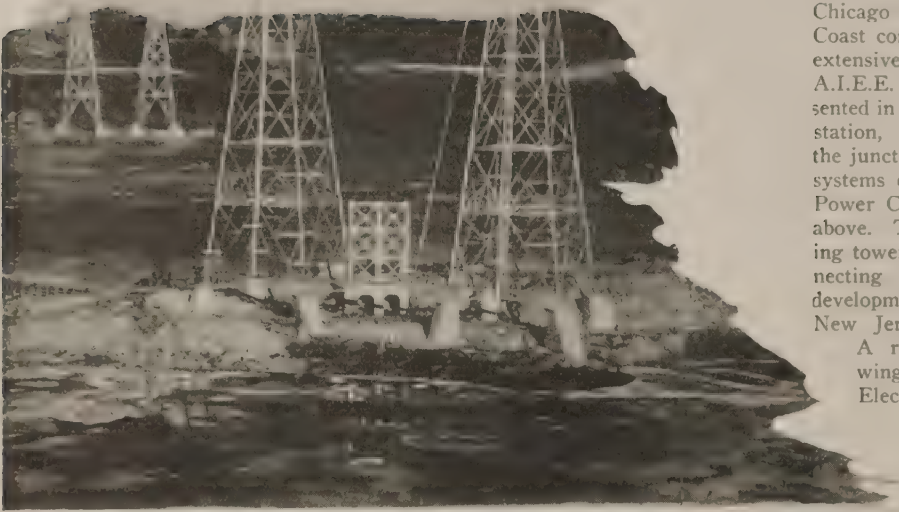
AWARD of the Harvard medal last week to James H. McGraw, publisher of the ELECTRICAL WORLD, "for distinguished contemporary service to advertising" should be of more than passing interest to electrical men. True, the electrical industry has never ranked among the larger employers of advertising, as a glance at the popular magazines of the day will attest. The romantic records of advertising have been written for the most part in terms of those commodities that have battled their way into the public fancy through spirited competitive selling, while electricity has prospered so far largely by the inherent appeal of this new service that has offered man so many obvious benefits not otherwise obtainable.

But electrical men are passing now into a new era in which their minds will more and more turn to the arts of marketing, among which that printed salesmanship called advertising is so important. Fortunate it is that so much knowledge has been amassed in the advertising experience of other fields within the last two decades. With its period of growth by the accumulation of customers drawing to a close, the electrical industry now enters the marketplace to joust for a larger share of the consumer's dollar. In the modern practices of advertising it will find a sturdy shield and a well-tried lance ready to hand.

Mr. McGraw has been a pioneer in the development of the art of advertising in the electrical industry from the time that he acquired the ELECTRICAL WORLD, back in 1899. The industry then consisted of an unrelated and scattered group of small shops, factories and power houses. His fourteen publications have been a progressive force in many industries. They have worked for the elimination of unethical and uneconomic practices. By the study of industry's buying habits and the effective forms of marketing organization needed for industrial products they have done much to clarify industry's own appreciation of the requirements of industrial marketing, as contrasted with the development of sales to the private consumer. It was for his leadership in this creative service that the Harvard medal was awarded to Mr. McGraw.

# *Interconnection—A Major Topic at Institute Convention*





EXPERIENCES with energy interchange in the Southeast, in Pennsylvania-New Jersey, in the Chicago district and on the Pacific Coast constituted the subject of an extensive symposium before the A.I.E.E. last week and are presented in this issue. East Point substation, near Atlanta, serving as the junction point for tie-lines from systems contiguous to the Georgia Power Company, is shown in part above. To the left are river-crossing towers for the 220-kv. lines connecting Conowingo hydro-electric development with the Pennsylvania-New Jersey interconnection loop. A recent view of the Conowingo plant of the Philadelphia Electric Company is below.

# A·I·E·E· Winter Convention

## *in New York*

MEASURED by attendance, the communication session of the winter convention of the American Institute of Electrical Engineers, held in New York City, Feb. 13-17, was the most popular, due undoubtedly to the joint session with the British Institution of Electrical Engineers conducted by means of transatlantic radio telephony.

From a purely technical point of view, however, the symposium on interconnection experiences really commanded the most attention, so that very lengthy excerpts from the papers are presented on pages 403 to 409, while the high points of the discussion may be found on page 396. The interest at other sessions centered chiefly around dielectric and lightning studies, automatic and supervisory control, automatic synchronizing and improvements in turbo-generators. Abstracts of all the papers are presented in this issue, as are also the major points developed in the ensuing discussions.

The ceremony at which the Edison and John Fritz medals were presented to Dr. W. D. Coolidge and Gen. J. J. Carty respectively and the customary dinner dance at the Astor constituted two of the formal occasions.

---

## Control, Protective Equipment and Substations

### *Protection of Supervisory Control Lines Against Overvoltage*

Edward Beck, Westinghouse Electric & Manufacturing Company.

Supervisory control lines used in the remote or automatic control of electric plants are subject to overvoltages dangerous to insulation and to operators. These overvoltages may be caused by lightning, crosses with the power lines, or induction from them. Cables with grounded sheaths are immune to disturbances caused by lightning or other electrostatic induction, and are more or less safe from crosses. However, the ordinary cable is still subject to high voltages by electromagnetic induction when a fault occurs on the power line in which it is included.

Even if apparatus locations are protected, high voltages may occur along the line and cause cable failure unless the cable is protected at intervals. Discharge currents of the order of 50 amp. for two seconds can be handled by a spark gap inclosed in argon under less than atmospheric pressure. Specially made cables will shield the line against extraneous disturbances.

### *Vacuum-Tube Synchronizing Equipment*

T. A. E. Belt and N. Hoard, General Electric Company.

Potential from high-voltage circuits is obtained by means of capacitance transformers. This potential is applied to the grid circuit of vacuum-tube amplifiers, the output from which drives a rotating type of synchronoscope. Thus the vacuum-tube synchronizing equipment makes unnecessary costly high-voltage transformers, which have been almost universally used for synchronizing in the past. The capacitance transformer does not affect the electrical characteristics or functioning of the high-voltage bushing in which it is mounted. The ratio is constant under changes in weather conditions. The ratio of the capacitance transformer is not affected by voltage change of the system; it changes with decrease in shunt resistance, but is negligible with a decrease in resistance down to 300,000 ohms. The normal leakage resistance of the capacitance transformer is approximately 100 megohms, and therefore the ratio, which is 0.05 per cent at 50 cycles and 0.04 per cent at 70 cycles, may be considered independent of frequency. The phase-angle shift changes slightly with change in frequency, being 2.75 deg. at 60 cycles, 2.4 deg. at 70 cycles and 3.3 deg. at 50 cycles with a 600,000-ohm shunt resistance.

### *Automatic Control of Edison Systems*

O. J. Rotty, Union Electric Light & Power Company, and E. L. Hough, General Electric Company

The St. Charles Street substation of the Union Electric Light & Power Company has been operating fully automatic for somewhat over a year very successfully. In practically every case of system disturbance the automatic control appeared to function correctly. In one case particularly, when the Keokuk transmission circuits were completely disabled by a tornado and the load thus released was suddenly thrown on the steam plants, this control gear operated admirably over a wide range of frequency and alternating-current voltage and through severe direct-current load fluctuations until the system was again stabilized. At the time of the disastrous tornado of Sept. 29, 1927, none of the machines at St. Charles Street even dropped its load, although the a.-c. system was subjected to many severe short circuits and grounds. Increasingly complicated operations will be controlled automatically with still greater reliability in the future, according to the authors.

### *Lightning Experience*

Philip Sporn, American Gas & Electric Company.

Performance of different sections of 132-kv. line reduced to a common basis, changes in tower design, work done to reduce lightning troubles at stations and efficacy of ground wire are related by the author. An extensive excerpt will be found on page 411.

### *Use of Condenser-Type Bushing in Synchronizing*

E. E. Spracklen, Ohio Public Service Company; D. E. Marshall and P. O. Langguth, Westinghouse Electric & Manufacturing Company.

Describes apparatus recently developed for utilizing the charging current of a condenser bushing in operating a synchroscope. Operating data are given covering different conditions of frequency, voltage, etc. The voltage characteristic is practically a straight line regardless of burden. Phase-angle error is practically constant with variation in line voltage. Practically constant ratio is obtained for a given frequency. The more resistive secondary burdens flatten out the voltage-frequency performance. The power factor of the burden appears to have little effect on voltage performance, however power-factor change affects the frequency-voltage characteristic. The phase-angle variation with temperature change is negligible. The voltage variation amounts to 2½ per cent for a burden of 15-volt-amp. at 50 and 60 cycles. Although considerable distortion is obtained in the capacity circuits, the reactor smooths out all variations and produces a very good wave form in the secondary current through the burden. The burden voltage drops with change of frequency above and below rating, the change being greatest for the heavier burdens. When two condenser-bushing potential devices are used for synchronizing the phase-angle error with change in frequency is about 2½ deg. for departures from rating of 7½ cycles.

JUDGING by the amount of discussion at this session the interest was about equally divided between protection of supervisory control circuits, lightning experience and new substitutes for the customary synchroscope coupling. Considering automatic control of Edison systems in St. Louis, Herman Bany contended that removing the batteries there indicates that automatic switching gives sufficient service reliability.

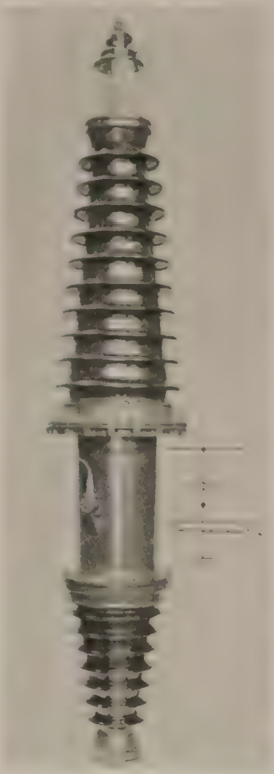
H. L. Wallau reported that automatic selection of buses is being employed with the synchronous converters in the latest Edison substations of Cleveland, but that no serious disturbance has occurred to test their functioning.

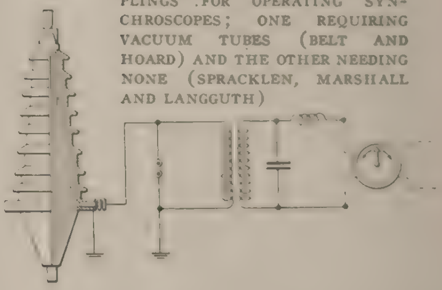
Opening the discussion on supervisory control protection, V. Boyd referred to an installation in Ontario of two control cables paralleling 44-kv. lines about 3 miles in which effective protection has been afforded by grounding each supervisory conductor through the primary of a transformer the secondary of which is connected to a supervisory equipment.

Chester Lichtenberg, pointing out that the success of supervisory control is predicated on continuous availability, declared that insulating transformers must be used when direct-current impulse and holding-coil currents are used on supervisory conductors paralleling high-tension lines. Choke coils will check electromagnetic disturbances and lightning arresters must be self-restoring. Power lines using carrier current for supervisory control have been protected on the Chicago South Shore Railroad by using pellet-type arresters, high-tension fuses and drainage coils.

C. Antoniono warned against the danger of power lines coming in contact with the lead sheath of supervisory cables, saying that the reliability of supervisory control is even more important than that of communication. A supervisory control line on the Chicago, North Shore & Milwaukee Railroad composed of both cable and aerial conductors and paralleling both 2,300 and 132,000-volt lines is protected by periodically spaced lightning arresters on the exposed sections, at each end of the cable, and by fuses in each circuit. Lightning has been found to cause most of the troubles experienced.

Alfred Herz declared that pilot-wire systems must also be protected against lightning. Mr. Beck, the author of a paper, closed by emphasizing the need of making ground resistance as low as economical.





TWO TYPES OF BUSHING COUPLINGS FOR OPERATING SYNCHROSCOPES; ONE REQUIRING VACUUM TUBES (BELT AND HOARD) AND THE OTHER NEEDING NONE (SPRACKLEN, MARSHALL AND LANGGUTH)

W. A. Kates declared that reputed effectiveness of arc-protecting devices is often minimized by the fact that there has not been sufficient segregation of the supporting data to make the conclusions convincing. Too infrequently are data collected on frequency and intensity of electrical storms and the basis for determining causes of outages is often superficial.

A. O. Austin submitted a discussion of some length, commenting chiefly on the value of ground wires. He also emphasized that performances of lines cannot be compared on a simple unit basis without taking into account clearances, intensity of storms, etc. Ground wires, he declared, reduce the stored potential in the protected conductors 30 to 40 per cent, so that the effect of a disturbance may spread farther beyond its sources than in the case where the stored potential is of great enough magnitude to dissipate itself rapidly through corona loss. Curves were presented indicating the relation between induced voltage and distances from disturbances with and without ground wires.

H. B. Vincent expressed the opinion that it would be interesting to hear how well arc-protecting devices guard insulators during surges; disturbances may never interrupt service and still damage porcelain.

Closing the discussion on lightning experiences, Mr. Sporn advised that the U. S. Weather Bureau has discontinued recording the frequency of lightning storms because it has found that new records merely corroborate what years of collected data have indicated. Consequently, utility operators can learn much about lightning in their territories by examining past lightning records of the bureau. In determining the causes of outages, the speaker pointed out that logs of interruptions are checked against relay records before deciding whether the cause of interruption was as indicated. Klydonograph records have indicated that no insulators designed for 1,100,000 volts flashover will break down as low as 400,000 volts even with oscillatory wave fronts such as suggested by Mr. Austin. Some grounding points on lines have been omitted with very satisfactory results, although the omissions were made for economy and not for the reasons suggested by Mr. Austin.

PORTION OF LOADING SEQUENCE CHART FOR ST. CHARLES STREET SUBSTATION (ROTTY AND HOUGH)

| Load on Machine (Amp. at 250 Volts) No. 8 | No. 12 | No. 11 | No. 7 | Total Load on Station | Operating condition |
|---|---|---|---|---|---|
| 1000 | 0 | 0 | 0 | 1,000 | **Minimum load** |
| | | | | | Load increases |
| 8400 | 0 | 0 | 0 | 8,400 | No. 8 gives signal to start No. 12 |
| 7000 | 1400 | 0 | 0 | 8,400 | After No. 12 is on |
| | | | | | Load increases |
| 7000 | 6300 | 0 | 0 | 13,300 | Before No. 12 recalibrates No. 8 |
| 9000 | 4300 | 0 | 0 | 13,300 | After No. 12 recalibrates No. 8 |
| 9000 | 6800 | 0 | 0 | 15,800 | No. 12 gives signal to start No. 11 |
| | | | | | *Etc. up to* |
| 9000 | 7200 | 7200 | 7400 | 30,080 | **Maximum load** |

| Load on Machine (amp. at 250 Volts) No. 8 | No. 12 | No. 11 | No. 7 | Total Load on Station | Operating condition |
|---|---|---|---|---|---|
| 9000 | 7200 | 7200 | 7400 | 30,800 | **Maximum load** |
| | | | | | Load decreases |
| 9000 | 7200 | 3000 | 7400 | 26,000 | Before No. 11 decalibrates No. 12 |
| 9000 | 5200 | 5000 | 7400 | 26,600 | After No. 11 decalibrates No. 12 |
| | | | | | Load decreases |
| 9000 | 5200 | 1000 | 7400 | 22,600 | No. 11 gives signal to shut down No. 7 |
| 9000 | 7200 | 5400 | 1000 | 22,600 | No. 7 reduces load, preparatory to timing off |
| 9000 | 7200 | 6400 | 0 | 22,600 | After No. 7 is off |
| | | | | | *Etc. down to* |
| 1000 | 0 | 0 | 0 | 1,000 | **Minimum load** |

Grading rings on 132-kva. insulators have not been found to increase their flashover value, but arc-protection devices have greatly avoided burning and breaking of the porcelain.

Because of the lateness of the hour very little opportunity was afforded for discussions on the new synchronizing equipment. E. D. W. Eby announced that the vacuum-tube synchronizing device is being compared with the ordinary synchroscope on a 110-kv. system to ascertain the relative accuracies.

Mr. Lund reported that the Metropolitan Edison Company has had very good experience with vacuum-tube synchronizing, even when the capacitance transformer bushing flashed over due to lightning. The apparatus is rather complicated but very reliable, he commented.

Mr. Langguth suggested four general uses for the new condenser type bushing: Synchroscope, frequency meters, voltmeters and relaying.

Mr. Marshall pointed out that a synchroscope can be connected with this bushing and operated without any intervening apparatus except a transformer, reactance, capacitance and a spark gap.

## Electrophysics and Dielectrics

### *Surge Impulse Breakdown of Air*

J. J. Torok, Westinghouse Electric & Manufacturing Company

Describes a phenomenon used to study the development of high-voltage sparkover. It has been found that if a voltage which is more than sufficient to cause breadown of a sphere-gap is applied and then very quickly reduced to a low value luminous streamers are produced instead of the usual intense spark. These streamers, which represent the intermediate stage between the initiation of and actual flashover can be recorded on a photographic plate by the use of a quartz lens. The effect on time lag of flashover, with special reference to the state of ionization of the gas previous to flashover, is also discussed. This method of "suppressed discharge" has also been used to determine the electrostatic field around insulators and between electrodes of various shapes.

### *Approximate Solution for Highly Oscillatory Networks*

E. A. Guillemin, Massachusetts Institute of Technology

The general solution for the slightly damped network is expressed in terms of the undamped solution by means of series expansions. The first part of the paper gives a method for evaluating the complex roots of the determinantal equation, and the second part shows how the expansions of the first part may be correlated with the Heaviside formula to form the complete approximate solution. An example illustrates the application to a simple network.

### *Boltzmann-Hopkinson Superposition Applied to Dielectrics*

F. D. Murnaghan, John Hopkins University

This paper shows that the principle of superposition is a necessary consequence of Maxwell's theory. It goes somewhat further and shows that the principle is valid for any theory which leads to a system of linear differential equations with constant coefficients.

### *Influence of Internal Vacua and Ionization on Cable Life*

Alexander Smouroff and Leo Mashkileison, Electrochemical Institute of Leningrad, Russia

Preliminary results of research show that internal vacua of the order of 350-400 mm. of mercury may appear in a cable under the influence of temperature changes and ionization of air, noticeably lowering the life of the cable. To prevent the dangerous effect of internal vacua the following recommendations are made: (a) Use of chemically stable compounds; (b) arrangement of ducts within the cable to maintain atmospheric pressure; (c) pumping of dry air through ducts in cable to maintain a pressure higher than atmosphere; (d) filling a cable with transformer oil under pressure to compensate volume changes of air in cable.

### *The Earth's Electric Charge*

W. F. G. Swann, Director of Bartol Research Foundation, Franklin Institute.

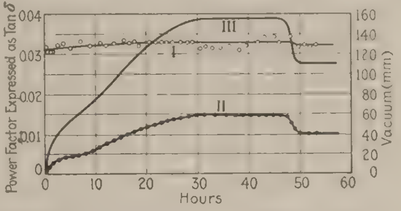
A new theory to account for the earth's magnetic charge was offered in this lecture. It was suggested that a slow death of positive electricity might be taking place on earth, leaving an excess of negative electricity to cause the earth's electrical charge under the influence of rotation. This idea may be incorporated in a consistent scheme of electrodynamics and at the same time provide an explanation of the earth's magnetic field. The theory suggests a possible origin for the known magnetic field for sun spots, and according to one interpretation, the velocity of matter in the sun spots need be no greater than about 80 km. per second in order to provide for the magnetic activity which they exhibit. It appears that the replenishment of the earth's charge could be accounted for satisfactorily by supposing that each cubic centimeter of the atmosphere supplies three electrons per cubic centimeter per second, and that these electrons are of such speed that they can travel a distance of 9 m. in air without absorption.

SUPPLEMENTING Mr. Torok's paper, C. L. Fortescue explained that the streamers in the sphere gap were due to molecular dissociation of the air. He mentioned that all severe lightning discharges may be considered to be of the negative-cloud type.

J. Slepian added that the slowness of ions returning to the cathode, in the case of sphere-gap discharge, constitutes a fundamental difficulty in applying the Townsend theory and that the single passage of the initiatory electron is sufficient to cause breakdown, the trail being highly conducting.

F. W. Peek, Jr., concluded, as a result of early investigations, that time lag is not a constant, but depends upon the rate of voltage rise and that sparkover voltage is different for lightning, needle-point and sphere-gap conditions. He reported that lightning surges always cascade over insulator strings, while 60-cycle impulses may or may not do so, the latter being automatically dissipated by the corona due to gradual application of potential. Horn gaps are not considered to increase spark-over voltages, although arcing rings may do so.

Considering the paper on cable life, William Del Mar suggested that the ability of a cable to absorb large quantities of oil from reservoir joints is possibly a heat-cycle action in which the expanding oil deforms the sheath but on cooling leaves voids, which are gradually filled by capillary action from the reservoir supply. The cables used by Smouroff and Mashkileison were judged to have been low-life specimens, differing considerably from American materials.



CHANGE OF VACUUM AND POWER FACTOR AS RESULT OF PROLONGED LIFE TEST (SMOUROFF AND MASHKILEISON)

(I) Power factor; (II) observed vacua; (III) vacua corrected for parasitical volumes.

C. L. Dawes cited four experimental parameters to be considered: Voltage, frequency, thickness of air space, and pressure. He declared that it is incorrect to "assume the loss angle of the dielectric proper (without air) to have a constant value and neglect the small variations of cable capacity with increase of voltage."

ELECTROSTATIC FIELD AS MODIFIED BY ELLIPTICAL RINGS (TOROK)

W. F. Davidson pointed out that the arrangement used by the authors for the test terminal permits the cable to pick up stray charges and possibly influences the results.

E. H. Salter suggested that the quality of cable used by the authors was apparently inferior to standard American products, judging from the results obtained. He also added that forcing air into and out of the cable specimens produces misleading effects, as in installed cables the quantity of air is unvarying, although the pressure changes with the heat cycles.

L. H. Conlin observed that the flat characteristics obtained in the prolonged life test were due in part to the air path produced in connecting the manometer and that the indicated results were caused by the using up of the oxygen content. Chemically stable compounds are necessary, declared the speaker, only to resist oxidation. The use of transformer oil was discounted for cable impregnation, as light oil, due to low reservoir pressures and rapid losses, will not prevent void formation even at short distances from the joint.

E. S. Lee contended that pressures in cables above atmospheric were conducive to long life, while those below atmospheric have the opposite effect, according to power-factor curves.

R. J. Wiseman added that full saturation is desirable and suggested alternate high and low pressure reservoir joints so that air can be forced to low pressure points and to maintain saturation.

Commenting upon Prof. Murnaghan's paper, V. Bush declared that the principle of superposition depends upon the validity of the assumption that each increment has the same fundamental characteristics.

E. R. Le Ghait stated that a close study of apparent contradictions in the theorem may lead to new light on the materials involved.

O. G. Marti showed that the principle of superposition does not hold unless the linear relation between time and quantities is not exceeded.

J. Slepian felt that undue prominence has been given to Maxwell's theorem of dielectrics and that if small enough voltages are used the quantities will appear to be linear. Dr. Slepian added that many a memoir on the mathematics of physics is vacuous of physics and, so far as the principle is concerned, expressed extreme skepticism on the value of the principle of superposition for obtaining further knowledge regarding dielectrics.

V. Karapetoff, the chairman, added that the situation was "macrocosmomorphic"; that is, built like the big world —in which the viewpoint of finding the unknown in terms of the familiarly surrounding is evidenced.

## Interconnection and Power Development

*Progress and Problems of Interconnection in Southeastern States*

W. E. Mitchell, Georgia Power Company.

*Interconnection and Power Development in Chicago District*

H. B. Gear, Commonwealth Edison Company.

*Conowingo and Philadelphia, with Reference to Interconnection*

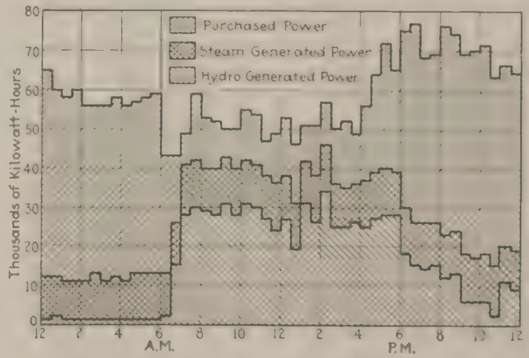
The late W. C. L. Eglin, Philadelphia Electric Company.

*Aspects of Pacific Coast Interconnections*

P. M. Downing, Pacific Gas & Electric Company.

EXPERIENCES with interconnection in the Middle Atlantic States, Southeast, Chicago district and Pacific Coast were ably presented by the authors indicated above, whose papers are abstracted quite extensively on page 403 of this issue. To make the discussion still more embracive of the subject as well as of the talent in the electrical field, nine well-known men in the utility field were called upon.

Charles L. Edgar contended that load dispatching is the heart of successful interconnected operation. Executive as well as engineering problems must be solved. Interruptions from lightning and switch or insulator failure are to be expected until more study is given to minimizing the disturbances caused thereby. Spectacular interconnections like the Chicago-Boston-Pensacola tie are merely demonstrations of the feasibility of parallel operation and possibility of exchanging energy between adjacent systems. But many tie lines have inadequate capacity for great transfer of power. Electrical interconnection, like the Lincoln Highway, merely permits transport between adjacent cities or territories and is not intended primarily for through transport.



INTERCONNECTION IN THE SOUTHEAST PERMITS MOST FLEXIBLE COMBINATIONS OF STEAM, HYDRO AND PURCHASED POWER (MITCHELL)

A. C. Marshall pointed out that the chief benefits of interconnection come from diversity of various kinds: Diversity of daily and annual load, generator capacity, latitude and longitude, construction programs, population, habits of living, industry, etc. Therefore it is impossible to imagine two systems which have identical characteristics, so the value of interconnection is widespread. Executives are chiefly interested in interchange agreements that will not require a Philadelphia lawyer and a Schenectady engineer to interpret.

James Lyman reported that sixteen years experience with interconnection in the Middle West had shown that voltages which were once considered adequate had to be increased to as high as 132 kv. A map of the 66 to 140-kv. lines in the Great Lakes region tells an entirely different story than a map of all the lines. Plots of 132-kv. line characteristics show that power factor influences decidedly the kilowatt-miles that can be transmitted. Ground wires and insulator shielding rings have been found to reduce interruptions considerably. Tie lines rated at 132 kv. and 50 to 60,000 kva. per circuit have been found adequate for the Middle West. Among the possible advantages of interconnection recited were: Availability of power to markets, favorable location of plants, load factor due to diversity, necessity of less generating capacity and reserve, increased reliability, staggered construction, normal and emergency exchanges of power.

Financing of interconnection is no kindergarten problem, declared Farley Osgood. Large investments are needed years in advance of the full income expected. Most rugged construction is essential to reliability of interconnection service and avoidance of duplicated expense. He cautioned his audience to design tie lines for high voltages initially so that they will not have to be scrapped for higher voltages. Rotary condensers were recommended on the customers' premises and favorable rates were urged to encourage their purchase by customers. Elimination of solid ties was suggested as a means of avoiding severe interruptions. High-voltage cable is greatly needed in congested territories. Every possible recording device which will enable studying experiences under abnormal conditions are desirable, as infallible data constitute the only guide to proper procedure. "Let no argument remove any appropriation therefor from the budget," he urged.

Interstate transmission involves legal and political aspects, declared E. C. Stone, that every engineer should recognize if he is to develop interconnection unhindered. The chief trouble lies in the inability of laymen to distinguish electric services from other utility services, largely because the kilowatt-hour cannot be traced in its course. While only 9 per cent of the energy generated crosses state boundaries, hindrance of interstate transmission will curtail its use by utilities to the detriment of the public.

L. W. W. Morrow corroborated the 9 per cent figure for interstate transmission and pointed out that 26 per cent of that transmission involves no change in ownership and that 16 per cent is interchange energy as compared with regular supply. The leading states in export and import of power have unusually large power plants and markets respectively. There is no reason to expect as great a growth in interstate transmission as in total energy growth.

All large water powers will soon be developed, declared W. S. Lee, who contended that markets should be served from the nearest power sources for economy. To fulfill their obligations to the public utilities will build water power where available and intersperse steam plants. Interconnection was favored only as a means of shortening transmission distances and not to carry large blocks of power long distances.

Loose-linkage interconnection, explained C. F. Hirshfeld, is to permit a system to separate readily when in trouble and to allow the parts to operate independently. Such a system remains intact under controllable or easily cleared troubles, but the portion in which uncontrollable trouble occurs is isolated and must shift for itself. Loose-linked systems comprise a collection of service areas, each of which must become self-sustaining instantly when trouble arises, but which operate in parallel normally. Reserve is necessary to make each area self-sustainable, but each area does not carry its own load independently normally. The boundaries of the service areas and interconnections are not fixed, but are shiftable to permit separation in an emergency with the least disturbance. Plants so connected can be operated for the best combined thermal economy, but some efficiency is sacrificed as the price of service protection. Such operation requires a higher degree of engineering and operating skill than solid-tie systems, it was contended.

F. A. Allner contended that there are advantages in interconnection even if two systems have identical characteristics, which is difficult to imagine. Benefits come from saving reserve capacity, ability to stagger construction and emergency exchanges of power. Hydro units can be synchronized quicker than steam, advised the speaker.

# Electrical Machinery

## *Reactances of Synchronous Machines*

R. H. **Park and** B. L. **Robertson**, General Electric Company

Part I treats those factors which are important to application or operating engineers and to designers. Synchronous, transient and phase-sequence reactances are defined and their methods of test outlined. A table is included which gives the numerical range of reactances for the various types of synchronous machines. Part II discusses the theoretical considerations, such as the effect of external reactance on negative phase-sequence reactance. Transient reactance is shown to be the difference between synchronous reactance and the ratio of the mutual reactance between armature and field and the total field reactance. Calculations are included to show that the short-circuit and open-circuit time constants are related to each other in a simple manner.

## *Synchronous Machines—IV*

R. E. **Doherty and** C. A. **Nickle**, General Electric Company

Four basic concepts underly the theory presented: (1) Characterization of the machine by four reactance coefficients, two corresponding to the main pole axis, i.e., direct axis, and two to the interpolar axis, i.e., quadrature axis; (2) resolution of flux and m.m.f. waves traveling with respect to the rotor into stationary, pulsating components in line with the direct and quadrature axes; (3) that the variable component of armature inductance varies between the direct axis value and the quadrature axis value as a second harmonic function of the electrical space angle. Each quantity in equations is expressed as a decimal fraction of "normal" value.

Expressions are derived for the short-circuit currents in the armature and field, for voltage induced in the open phase, and for voltages across external reactances in the armature and field circuits. The short circuit currents are expressed as the sum of two series, one of odd, the other of even harmonics, in which the magnitudes of the harmonics in ascending order are in geometric ratio. It is shown that although voltage induced in the open phase during single-phase short circuit may be fifteen or twenty times normal in a laminated, cylindrical rotor machine without amortisseur circuits, it may be only two to four times normal in a salient-pole machine. An amortisseur winding greatly reduces it in either case.

## *Calculation of Armature Reactance of Synchronous Machines*

P. L. **Alger**, General Electric Company.

The author presents new and simplified formulas for the armature reactance of synchronous machines and compares the results obtained with tests on 100 machines of various types. The new formulas are characterized by unusual expressions for the end leakage and for the air gap or differential leakage reactances. Formulas for zero phase-sequence reactances are given. The definitions of armature leakage and armature reaction reactances used are those proposed by Doherty and Nickle in 1926. As a result the leakage reactance has a much smaller value than has heretofore been assigned to it, thus requiring a rather fundamental revision of the ordinary conceptions of the flux densities existing in the various parts of a loaded synchronous machine.

## *The Thermal Volume Meter*

C. J. **Fechheimer** and G. W. **Penney**, Westinghouse Electric & Manufacturing Company.

A development of the original device of Professor Thomas. The principle involved is that of raising the temperature of a gas by means of an electrical heater, the change in temperature being accurately measured either by means of a thermopile or resistance thermometers connected in a wheatstone bridge network. The thermocouple method is offered as being preferable to resistance thermometers and most of the consideration is devoted to that type of construction. A sufficient number of thermocouples is required to give a good reading of the potentiometer with a comparatively low temperature rise of the gas, and also to obtain a good average of the gas temperature. The details of construction, the equations for calculating the volumes of gas and the possible sources of error are included.

THE three papers regarding synchronous machines constituted a unit and were presented as such. F. D. Newbury, chairman, in discussing the contributions, mentioned the increase in the number of known reactances for which allowance must be made, from the original two of earlier days of design work to an essential seven and generally accepted thirty-one.

A. E. Kennelly suggested that it was highly important that the useful concepts regarding reactance and other synchronous machine factors which were included in the various papers be clearly tabulated and classified so that in speaking of the reactances of synchronous machines it may be mutually understood just which ones are involved. The suggestion to express the figures in unit values rather than in per cent terms received particular approval.

As a result of investigations conducted with salient-pole and cylindrical-rotor machines J. J. Linebaugh derived curves, both theoretically and experimentally, which check very closely. The effect of salient-pole and amortisseur windings was indicated by voltage and current curves.

B. A. Behrend praised the work of the investigators who had made their determinations with such mathematical preciseness, but suggested that it is sometimes wise to compromise with knowledge to secure simplicity. The futility of accuracy in design greater than that which can be imparted in construction was suggested as a consideration not to be overlooked.

R. Treat pointed out that the growth of knowledge regarding synchronous machines requires continually diminishing numbers of empirical constants and factors. Complications are reduced by a realization of the comparative unimportance of certain factors. The work of the authors was foreseen as a basis for determining with considerable reliability the effect of synchronous machines upon oil circuit breakers, relay operation and the general stability of systems to which they are connected.

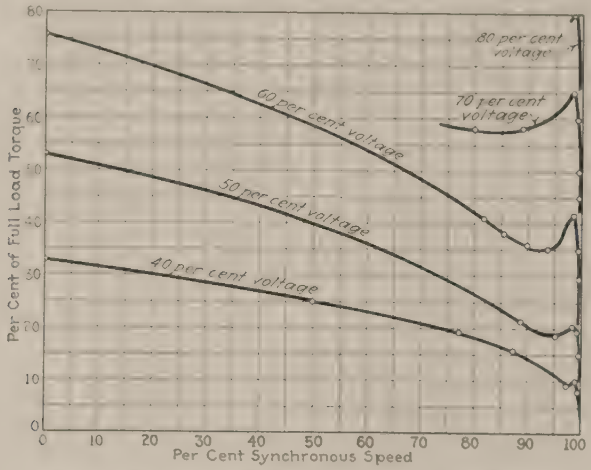
W. V. Lyon contended that the mathematical side of the question had not been overstressed and that the papers afforded a steppingstone to a more complete solution of the general problem involved in the use of synchronous machines. It was also his contention that the phrase "transient reactance" is a misnomer, as reactance depends upon frequency.

W. F. Dawson expressed the opinion that the assumption of sinusoidal wave form made in preparing the surge-curve envelope leads to errors, as great as 25 per cent in some cases. These errors often lead to the specification of larger oil circuit breakers and equipment than necessary. He suggested that r.m.s. values of the wave shape be employed.

H. H. Spencer suggested the possibility of using superposition in preparing these curves and computing circuits.

A. A. Bennett objected to the analyzing of functions in Mr. Alger's paper, contending that it is unreasonable to resolve into components vectors which do not reasonably exist as such in a machine.

In closing the discussion Mr. Doherty defended the inclusion of details in the determinations, but agreed that it is permissible to neglect certain factors if it can be demonstrated that they are comparatively insignificant. The thirty-one reactances considered in the paper reduce to only seven in actual practice, it was pointed out. Mr. Park reported that detailed treatment of three-phase phenomena is not available now, but may be in the future. He also concurred with Mr. Dawson's comment regarding the sinusoidal wave forms.



TORQUE SPEED CHARACTERISTICS OF TWO-POLE SYNCHRONOUS MOTOR AT VARIOUS VOLTAGES (MCLENEGAN AND SUMMERS)

Considering the thermal volume meter, W. F. Dawson stated that this device has proved almost indispensable for the investigation of significant conditions involved in turbo-alternators and similar classes of electrical machines. By employing resistance coils instead of thermocouple instruments measurement within one-tenth of 1 deg. can be obtained.

Mr. Fechheimer advised that he had conducted his original measurements with resistance thermometers, but not with the stream-line device mentioned by Mr. Dawson, although this expedient may have certain advantages. However, an accuracy of one-tenth of 1 deg., when total variations of only 2 deg. are to be measured, was not considered satisfactory by the speaker. The use of a number of thermocouples, as described in the paper, was suggested as a satisfactory solution of the temperature recording difficulty.

## Electrical Machinery

(SECOND SESSION)

### *Effect of Transient Conditions on Compound Motors*

L. R. LUDWIG, Westinghouse Electric & Manufacturing Company.

When a direct-current compound motor is started the rise of current in the series field induces a counter potential in the shunt field and the current may reach several times normal value in a negative direction. This produces the effect of differential compounding and causes the starting torque to be materially reduced. Where the motor is continually started and stopped the effect may be so serious as to dictate the choice of another type of motor. In case the compound motor is disconnected from the line while running and reconnected with no external resistance, the delay in establishing a flux, due to the damping action of the shunt field, may permit excessive currents to flow. A study of such transients leads to means by which they may be minimized and suggests methods for predetermining motor behavior.

### *Design and Application of Two-Pole Synchronous Motors*

D. W. MCLENEGAN and IVAN H. SUMMERS, General Electric Company.

The synchronous characteristics of the two-pole motors are similar to those of lower speed salient-pole machines. In sizes smaller than 800 to 100 hp. at 3,600 revolutions per minute the synchronous motor is hardly competitive with the squirrel-cage or the slip-ring motor unless the need of power factor improvement justifies a considerably higher first cost. The two-pole synchronous motors now in service are used to drive centrifugal gas boosters or centrifugal air compressors in connection with sewage disposal or copper refining processes. Since the two-pole synchronous motors are of large ratings and necessarily have low reactance, it is important to design the control equipment to start and accelerate the motor with the lowest possible inrush. In general, if a synchronous motor falls more than a few per cent below synchronous speed, due to momentary voltage drop, it will not resynchronize upon return of voltage. However, if the direct-current excitation can be removed and the oil-circuit breaker in the armature circuit remains closed the motor can resynchronize provided the squirrel-cage torque at subsynchronous speeds just below synchronous is sufficient to carry the load.

### *Heat Losses in the Conductors of a Direct-Current Armature*

W. V. LYON, E. WAYNE and M. L. HENDERSON, Massachusetts Institute of Technology

The armature copper loss in a direct-current generator is not correctly computed by squaring the armature current and multiplying by the measured armature resistance between brushes, because the disturbance produced by the commutation persists throughout the cycle, so the current is not uniformly distributed over the cross-section of the conductor. To find the extra losses the vector method of analysis is employed, assuming that the time variation of the coil current is trapezoidal and computing the losses for each harmonic component as previously described by W. V. Lyon and I. H. Summers. Where several coils are side by side, as is usual in a d.-c. armature, the average extra loss is computed as if the coils that are side by side were connected in parallel and carried the vector sum of the currents in these coils.

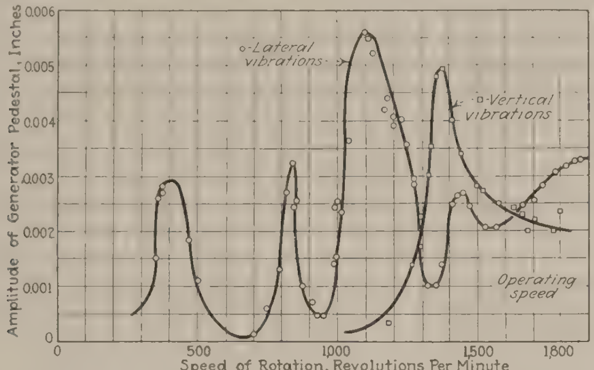
### *Improvements in Turbine Generators*

S. L. HENDERSON and C. R. SODERBERG, Westinghouse Electric & Manufacturing Company.

Both electrical and mechanical improvements are covered. Multiple radial distribution has diminished the ventilation problem of large units. Provisions for hydrogen cooling are being made. Eddy currents are being avoided by coil and strand transposition. Swelling and wrinkling of mica-folium is being avoided by a new bond and semi-conducting corona shields are proving effective for coil insulation. Generator voltages as high as 22,000 are being used. Stators are being built of steel almost equivalent electrically to that used in transformers. Non-magnetic material is avoiding trouble with coil-retaining rings and finger plates. No indications of instability have been observed with 0.8 to unity short-circuit ratios. Structural steel skeleton frames have revolutionized stator construction and built-up plate rotors and one-piece rotor forgings have simplified rotor construction. With a multiplicity of resonance frequencies or critical speeds the problem is to design machines so they will operate in the valleys of resonance curves.

DISCUSSION at the second session devoted to electrical machinery centered chiefly around recent improvements in turbine generators. W. J. Foster advised the audience that two plants have already selected a generator voltage of 22,000. Referring to the swelling of mica-folium, he pointed out that there are better bonding materials than shellac when high temperature must be withstood. To prevent corona deterioration, insulated metallic sheathing has been tried out, but it was not permanent. A sheath is needed which adheres closely to the insulation and does not deteriorate electrically or chemically. Hydrogen cooling benefits rotors more than stators.

Stress charts developed twenty years ago were displayed by B. A. Behrend, who referred to the failure of the old Niagara generators and concluded that the construction employed and not the calculations were at fault. Plate-type rotors are favored by the speaker, who claims that forging a hole in a rotor reduces the strength in a critical direction.



RESONANCE OCCURS AT SEVERAL SPEEDS—UNIT MUST BE DESIGNED TO OPERATE AT INTERMEDIATE VALUES (HENDERSON AND SODERBERG)

Solid rotors were recommended by M. D. Ross for large synchronous motors so that they may be made self-starting, the same as smaller machines. The number of starts which can be made depends on the heat storage capacity of the rotor. Salient-pole motors will pull into synchronism without excitation. The speaker expressed the hope that better knowledge of the characteristics of two-pole synchronous motors would open their field of application.

Two discussions from abroad were presented, one by Edouard Roth and the other by A. B. Fields. The former declared that skeleton-frame generators have doubtful value in England. Leakage slots give great stability without increasing short-circuit ratio appreciably. Heating of end plates can be avoided by using non-magnetic metal. Thin mica and a small percentage of bond avoid swelling of mica-folium, declared the author of this discussion, who referred to a French machine for producing homogeneous insulation. Solid steel forgings are being used for rotors as large as 75,000 kva. Mr. Fields suggested more consideration of water and oil cooling of rotors.

A new type of steel was mentioned by W. J. Merton for retaining rings and poles. He referred to the improved physical characteristics which can be obtained by heat treating rotor forgings or subjecting them to high-frequency magnetization.

R. W. Owens, referring to the operating requirements of centrifugal gas compressors, emphasized that they must operate at 10,000 to 20,000 r.p.m. The starting requirements are low, as motors require only 30 to 40 per cent full voltage to start. For this reason he recommended solid rotors to obtain the starting effect.

R. B. Williamson contended that ventilization is no longer a limit to machine size and that laminated conductors have overcome the eddy-current bugbear. The real limit to size is shipping weight (approximately 200,000 lb.), so rotors constitute the limiting factor. Great difficulty is experienced in securing sound castings free from hair cracks. To avoid these the forgings should be made from freshly poured billets. Coil-retaining rings are almost limited to alloy steel and this is usually brittle. Attempting to utilize metals with a higher tensile strength than 85,000 lb. per square inch was not favored by the speaker. Overheating of end rings and development of flaws may result from single-phase operation. To prevent starting of hair cracks it was suggested that end rings be machined.

S. L. Henderson reported that the permanence of the corona shields mentioned in his paper has been tested. No tooth failures have been experienced in five years with silicon-steel stators.

C. R. Soderberg advised that the only way to improve the character of carbon steel is to heat treat it. The stresses caused by forging a hole in a rotor are not objectionable if kept within control. Solid disks do not have sufficient advantage over disks with a hole to warrant substitution, in the speaker's opinion. Great improvement in materials available is shown by micro-photographs. Unexpected faults in materials are more responsible for troubles than miscalculations. This speaker also contended that it is not wise to increase the tensile strength at the expense of ductility.

The remaining discussion at this session was less extensive and referred to the other three papers. I. H. Summers expressed favor for squirrel-cage windings over solid rotor construction for starting effect because the characteristics are controllable. Furthermore, the pull-in torque close to synchronism is high. D. W. McLenegan agreed that reactance starters are ideal when the impedance of the motor increases rapidly, but are not desirable for two-pole synchronous motors. In the control apparatus described in his paper the auto-transformer circuit is not interrupted, so the in-rush current is limited.

R. F. Franklin cautioned that an attempt to reduce excess direct-current armature losses may harm commutation and said that there are conflicting operating requirements where flux is considered.

B. A. Behrend briefly reviewed the literature available on eddy-current losses and expressed the hope that a complete study of the subject would be made some time. He criticised the A.I.E.E. publications committee for failure to print some scientific papers which have been given great attention abroad.

## Communication

### *Transatlantic Telephony—The Operating Problem*

K. W. Waterson, American Telephone & Telegraph Company.

The economic features of rates, service, company policy and personnel for transatlantic telephone communication and statistics on the anticipated value to subscribers are given by the author. The uniformity of charge bases and the methods by which the operating divisions of the American and European systems co-operate are outlined. Calls average seven a day, are about evenly divided between hemispheres of origin and, with the exception of some 5 per cent, are carried on in English.

### *Certain Topics of Telegraph Transmission Theory*

H. B. Nyquist, American Telephone & Telegraph Company.

Solutions have been derived previously for lines with simple terminal conditions, but, according to the author, it has long been recognized that the extension of the same methods to the more complicated terminal problems leads to great difficulties. This problem has been attacked from the alternative standpoint of steady-state characteristics. This method has the advantage that it does not complicate the calculations materially. The criteria for distortionless transmission are expressed in terms of the steady-state characteristics. The minimum frequency range required for transmission at a given speed of signaling is considered. A comparison of single side-band and double side-band transmission for carrier telegraphy is presented.

### *Loudspeakers of High Efficiency and Load Capacity*

C. R. Hanna, Westinghouse Electric & Manufacturing Company.

Elements considered in the design of high-quality air-column loudspeakers with moving coil drivers are enumerated and described. Efficiency and maximum output capacity are calculated. The methods which may be used for providing sound volume greater than that possible with a single loudspeaker are described. The author has proceeded upon the basis that the moving-coil driver offers the most suitable means for the transformation of electrical energy into mechanical energy in loud-speaking equipment. It is also his acceptance that the exponential type of horn offers the most suitable device for mechanical-acoustical energy transformation. A horn with a low rate of expansion and a large mouth has been used in this work. A device employing three elements with individual horns has been developed, not to increase tone quality, but to secure an increased volume.

### *Transatlantic Telephony—The Technical Problem*

L. B. Blackwell, American Telephone & Telegraph Company.

An outline of the design and construction problems involved in the present transatlantic telephone communication facilities. The equipment in North America and on the other side of the Atlantic and the fundamental considerations which influenced the specification of the diversified devices used are mentioned. Single sideband carrier transmission is used in this work and through the necessary arrangement of switching devices the circuits are energized only during speech transmission resulting in reduced energy of consumption and interference. Separate paths are used for east and west-bound communication. While long waves are used as standard, the short-wave circuit from England to the United States is reserved for emergency use. The advantages derived through proper selection of geographical placement of stations and of minor refinements are reflected in the conservation of transmitted energy throughout the telephone system.

FOLLOWING the presentation of the papers of Messrs. Blackwell and Waterson, a joint session of the American Institute of Electrical Engineers and the Institution of Electrical Engineers (England) was conducted by means of the transatlantic telephone facilities. Archibald Page acted as joint chairman. Speakers included Bancroft Gherardi, John J. Carty, F. B. Jewett and H. P. Charlesworth in America, Archibald Page, T. F. Purves, Sir Oliver Lodge and Colonel Lee in England. President Gherardi spoke of this occasion as but a further step in bringing widely separated groups together. President Page paid tribute to the work of American telephone engineers through whose work this development became possible. The joint meeting was mentioned by Colonel Purves as but another proof of the "internationalism of engineering" In seconding a resolution of satisfaction over the consummation of this event, proposed by General Carty, Sir Oliver Lodge expressed the hope that "no word of hostility be ever spoken between the English-speaking peoples."

In discussing Mr. Hanna's paper on high-efficiency and high load-capacity loud speakers, H. Fletcher commended the determination of efficiency by two additional methods as well as by calculations and mentioned that while Mr. Hanna's device produced approximately 40 per cent over-all efficiency, several commercially available designs could be said to attain 50 per cent. The derivation of the experimental response curve shown in the paper was a matter of inquiry, as was the use of the equation for diaphragm thickness which gave values nearly twice those thought necessary by Mr. Fletcher for the purpose of avoiding resonant vibrations.

A. E. Kennelly suggested the use of electric circuit terms in the new "acoustical" circuit work in order to simplify the nomenclature for investigation and study in the latter field. Acoustic impedance and ohms were specific recommendations.

The diaphragm-thickness formula was reported by Mr. Hanna in his closing remarks to represent the values indicated as desirable according to the result of his experience.

## Arc Welding

### *The Stability of the Arc Welding*

P. Alexander, General Electric Company.

The stability of the iron welding arc is influenced by a number of factors, such as the nature and the aerodynamic state of the surrounding atmosphere, the strength and distribution of the magnetic field, the composition of the electrode, the nature and the amount of gases occluded in the electrode, etc. The cooling of the electrode and the arc core has the preponderant influence on the stability of the arc. If the vapors of alkaline earths or alkali metals be present in the space between the electrodes, striking and maintaining of the arc would be much easier than in air. It requires much greater voltage to strike an arc with water-cooled electrodes than with electrodes allowed to become incandescent.

### *Welding and Manufacturing of Large Electrical Apparatus*

A. P. Wood, General Electric Company

The present tendency is to produce large electrical machinery from welded steel plates, thereby practically eliminating the pattern shop and foundry. By making these large structures of fabricated plates, no expensive patterns are required. Valuable pattern storage space can be used for other manufacturing purposes. Foundry space is reduced and the substitution of welded forms for castings results in a great saving of time and eliminates the possibility of a defective casting due to cores shifting, blowholes, cold shots and pouring gates, which require time to burn and machine off. The work of the machine shop is reduced to a minimum, as the plates arc-welded together have approximately the finished dimensions, whereas a casting requires excessive machining.

### *Effects of Surface Materials on Metallic Arc-Welding Electrodes*

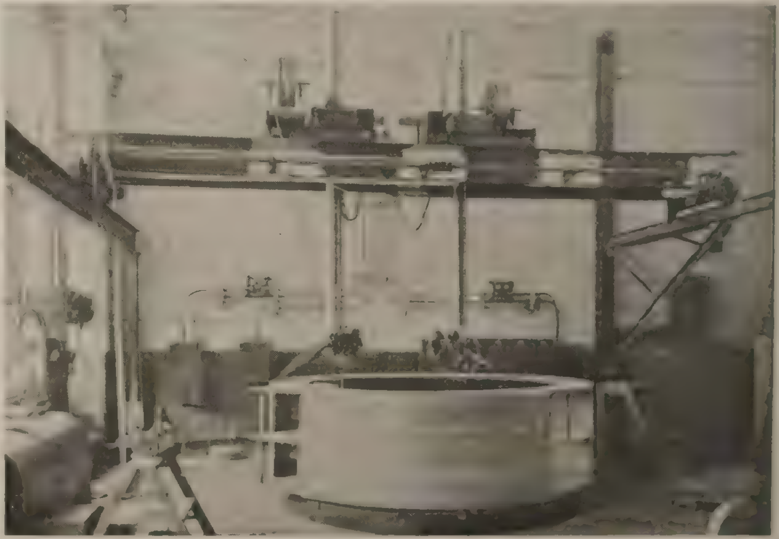
J. B. Green, Fusion Welding Corporation.

Surface materials have a significant influence on the brittleness or ductility of weld metal and can be used to control the type of arc developed They also affect the heating of electrodes and may be employed to control the operating characteristics of the electrode and the resultant weld properties. Among operating characteristics might be mentioned stability and rate of melting. Among the weld properties are included freedom from blowholes and tensile strength. Other practical applications of a comprehensive knowledge of surface materials are cited in this paper, which also deals with the fundamental theory of arc heat distribution, arc vapor resistance and similar characteristics modified by the presence of surface materials.

### *Arc-Welded Structures and Bridges*

A. M. Candy, Westinghouse Electric & Manufacturing Company

The advantages ascribed to arc welding follow: (1) The weight of materials required in a member or structure can be reduced by as much as 18 per cent; (2) no material is removed from members for welded connections such as rivet holes for riveted construction; (3) the weight of connecting material in some cases can be reduced 50 to 90 per cent; (4) absolute



STATOR-FRAME AUTOMATIC WELDER FOR FRAMES UP TO 14 FT. DIAMETER (WOOD) fixation of one member to another can be readily obtained; (6) greater rigidity can be obtained in a structure; (7) overlapping members can be completely sealed by weld metal, thereby excluding moisture, preventing corrosion and making a structure easier to paint; (8) changes in or additions to structure can be made with a great saving in both time and expense; (9) more pleasing designs and in some cases designs impossible by other processes can be produced; (10) the welding process is practically noiseless.

TO ILLUSTRATE the character of arc phenomena and influence of welding materials Mr. Green presented a series of lantern slides and a slow-motion picture film secured by the use of infra-red sensitive negatives. Replying to questions by C. Siebenmorgen, J. C. Lincoln, A. P. Wood and A. M. Candy, Mr. Green explained that the electrodes were $\frac{3}{16}$-in. diameter, the currents about 125-150 amp. and that the different length paths assumed by the arcs were probably due to the relative and absolute resistances of the core and sheath characteristics. Hand welding was used in making the study, a constant potential source with large excess of ballast resistance being utilized. Flux is used in gas welding to dissolve the oxide, while for electric arc welding its purpose is to improve the arc-heat distribution. In his opinion arc and gas welding, in so far as quality of work is concerned, are interchangeably satisfactory.

An explanation of the fundamental idea of the atomic welding process was offered by Elihu Thomson in connection with Mr. Alexander's paper. Dr. Thomson pointed out that the concept of dissociation means that a molecule in absorbing energy under welding conditions is broken up into its atomic components, which reassociate with a release of energy.

In response to an inquiry by E. Herzog regarding the use of atomic ionizing-potentials, Mr. Alexander indicated that molecular values are unnecessary except for gases, as other materials listed do not exist in gaseous form except in the atomic state. He advised that ionizing-potentials referred to in his paper involve the energy that an electron should accumulate to energize a neutral atom. Replying to an inquiry by R. J. Kehl regarding a practical application of hydrogen shielded arc, Mr. Alexander reported that it is not sufficient merely to establish the fundamental principles involved in such a process, since the technique of handling must be advanced to a usable state.

A question of whether atomic welding could produce oxide-free welds was answered in the affirmative by the author, who also added that the resistance to corrosion of atomic-hydrogen welds had not as yet been fully established, but that higher corrosion-resistance values are anticipated.

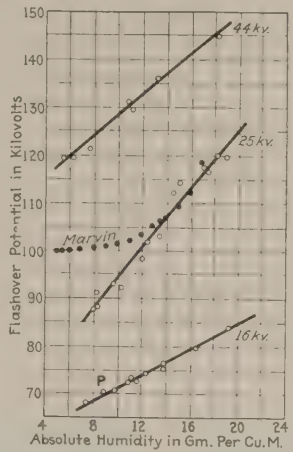
J. C. Lincoln demonstrated an electric torch in which two-thirds of the heat of the electric arc appeared in the flame. Herman Lamb and Dr. Thomson added data regarding similar devices known to them some years ago.

# Miscellaneous

## *Effect of Humidity on Dry Flashover of Insulators*

J. T. LITTLETON, JR., and W. W. SHAVER, Corning Glass Works

Humidity affects considerably the flashover voltages of porcelain and Pyrex insulators, the potential rising as the humidity is increased. This characteristic is a surface effect which varies with the absolute water content of the surrounding atmosphere. A decrease in flashover potential was noted at humidities above 90 per cent, but is believed to be due to condensation on the insulator surface, which could be avoided by having the insulator at the proper temperature. The curve slopes for porcelain insulators are slightly steeper than those for Pyrex insulators having approximately the same flashover potential. This may be accounted for by the high chemical resistivity surface of Pyrex insulators. A No. 441 Pyrex insulator at 760-mm. pressure and 35 deg. C. temperature would flash over at 128 kv. with a 10 per cent relative humidity and at 193 kv. with a 90 per cent relative humidity. Moreover, the apparent straight line relation between flashover potential and absolute humidity makes it possible to adopt a correction factor for the humidity effect on a given insulator and to catalog the dry flashover potential at a standard humidity as well as at a standard temperature and pressure.



VARIATION OF FLASHOVER POTENTIAL WITH HUMIDITY (LITTLETON AND SHAVER)

The curves apply to porcelain insulators, but very similar curves apply to Pyrex insulators.

## *Cathode Oscillograph in Study of Line Surges*

HAROLD NORINDER, Swedish State Power Organization

Investigations were reported covering the value of lightning arresters and other apparatus for protecting lines and equipment against surges, the fundamental nature of surges and the relation between natural lightning and laboratory lightning. The klydonograph was found to fail in many desirable requisites and serially modified. Specially constructed cathode-ray oscillographs were used. It was found particularly desirable to measure short-time intervals of the order of $10^{-6}$ to $10^{-8}$ seconds and to secure records of transients at exceedingly brief intervals during long periods of phenomena absence. The instrument employed should be of such relatively simple nature that it can be used by station mechanics or most operators, and the instrument should be in the recording position at all times. These requirements are met by the modified Dufour oscillograph.

## *The Saturation Permeameter*

S. L. GOKHALE, General Electric Company

A device for speedy and accurate measurement of the limiting value of intrinsic induction of magnetic material. The permeameter is of the bar-yoke type, capable of producing a magnetizing force of 4,500 gausses without excessive heating. A coil compensates automatically for the spatial flux inclosed by the potential coil, so that the ballistic deflections indicate the saturation value without any further computation or correction. The permeameter is suitable for all magnetic materials except cobalt and permanent magnet steels and will measure $B$ or $\beta$ with $H$ as low as 200 gausses.

## *Compressed Powdered Permalloy—Manufacture and Properties*

W. J. SHACKELTON, Bell Telephone Laboratories, and I. G. BARBER, Western Electric Company.

The manufacture of magnetic cores of compressed permalloy powder and the electrophysical and magnetic properties, including permeability, core loss and modulation, are treated. The permalloy considered contains approximately 80 per cent of nickel. The technical problems involved in powdering the permalloy and in insulating the powder so that subsequent high-pressure forming and high-temperature heat-treating operations may be applied are related. The processes are said to be adaptable to economical large-scale production and at the same time to be controllable so as to insure a highly uniform product. Loading coils made with this magnetic material approximate one-fifth to one-third the size of former coils with no sacrifice in quality and with appreciable improvement in transmission efficiency, inductance stability and modulation.

RESPONDING to a question regarding his saturation permeameter, Mr. Gokhale explained that the method of clamping the specimen or degree of contact is not of primary importance in test work with this device and that the temperature rise during operation does not exceed 2.5 deg. C.

Mr. Shackelton pointed out that the use of permalloy-dust in place of iron-dust loading coils greatly reduces space requirements for manhole and duct-system installations and facilitates line design and construction.

B. Gherardi mentioned that the loading coil constituted not an incidental but an essential part of modern telephony, 3,000,000 being in use in this country, approximately one for every six telephone instruments, and that these devices are being added to the lines at the rate of 6,700,000 yearly.

In response to an inquiry from the floor, Mr. Barber, who read the joint paper, replied that so far as he knew no attempt had been made to apply permalloy to other than telephone fields, due, he felt, to the relatively low permeability.

Discussing the paper on flashover potentials of insulators, E. D. Eby suggested that a correction factor is needed for rating and specifying different type insulators. While impulse flashovers are considered unaffected by wet or dry conditions, tests have shown that at 40 to 100 per cent relative humidity and 180 to 225-kv. crest voltages the highest flashovers occurred at 95 to 100 per cent relative humidity. The values did not go below those for wet flashovers on the specimens. Sustained periodic tests over several years indicated humidity and flashover voltages to be a maximum in August and a minimum during the month of January.

C. L. Clarke submitted the determinations of P. Woog with flashovers on glass cylinders as an explanation of the observed effect of increased flashover values with high humidity and suggested that it is not an air dielectric effect but a surface effect of the insulator that is involved.

C. F. Harding corroborated the statements regarding increases in flashover voltages with higher humidity values. Professor Harding pointed out the folly of referring insulator test data, secured under 60-cycle conditions, to a sphere-gap basis as flashover tests upon sphere gaps are not affected by humidity. Errors of 14 to 15 per cent may be involved in such comparisons.

Referring to Mr. Norinder's lecture, D. W. Roper reported that as a result of the dismantling of many pole-type distribution transformers rendered useless by lighting, scars had been found in all cases on only the secondary windings. Twenty to thirty such burnouts occur annually on the lines of the Commonwealth Edison Company. Although 300 to 400 domestic meters are connected to such secondaries no meter burn-outs are found. House services are carried through iron pipe, which is believed to protect the consumer's end of the circuits. In fifteen or twenty cases the wires have shorted to the pipe, but investigation indicated the presence of standing water in the pipe due to faulty erection practices. The possibility of protecting the transformer end of the service by the use of a ground pipe is being undertaken by means of cathode-ray oscillograph equipment.

K. B. McEachron mentioned the difficulty of automatically starting recording processes so they will respond quickly after a disturbance starts and suggested the use of a hot, instead of a cold, cathode ray oscillograph. The transient may be delayed slightly by passage through a cable section of known characteristics so that the surge reaches the oscillograph after the latter has attained full operating condition.

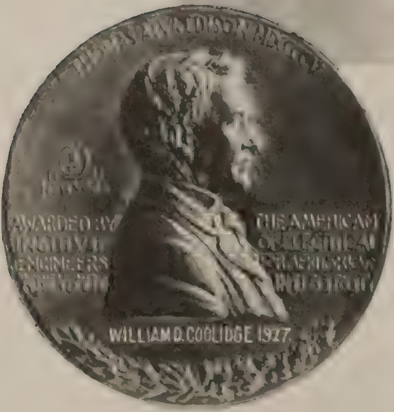
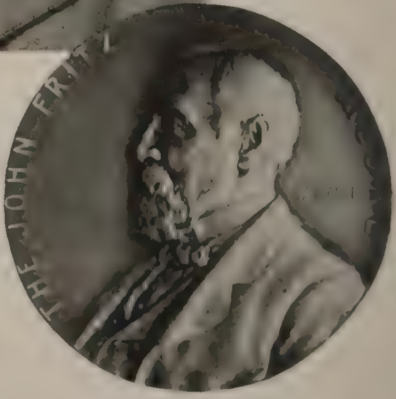
# *Edison and John Fritz Medals Awarded*

WILLIAM
DAVID
COOLIDGE

JOHN
JOSEPH
CARTY



PRESENTED
AT THE
WINTER CONVENTION
OF THE
AMERICAN INSTITUTE
OF ELECTRICAL ENGINEERS
FEB. 15, 1928



*"The Gold Medal has been awarded to* ***William D. Coolidge*** *for his contributions to the incandescent electric lighting and the X-ray arts by the American Institute of Electrical Engineers."*

*"The Medal for the year 1928 has been awarded to John Joseph Carty for pioneer achievement in telephone engineering and in the development of scientific research in the telephone art."*

# *Symposium on*
# Energy Interchange

Experiences in Pennsylvania-New Jersey, Southeast, Chicago district and Pacific Coast interconnections related before A.I.E.E. convention

THE past four years has witnessed additional and higher capacity interconnections. Individual system operation has been improved, as has co-ordination between systems. More use is being made of interchange facilities. More careful forecasts of load growth and system planning are being conducted. Advantage is being taken of the lower costs of larger units and particularly of the efficiency of the modern steam-generating plants. Long-distance transmission is growing more reliable. But there are still many problems unsolved or only partially solved.

Load dispatching becomes more difficult and complicated with the growth of systems. Relaying continues to require much study. The division of load between parallel circuits, the control of wattless current, system stability and more reliable oil circuit breakers are problems worthy of the best engineering brains in the industry. As hydro-electric stations decrease in size, more automatic ones will be constructed to keep down the cost per kilowatt-hour. The future will probably see still larger steam plants with larger units located at the mine mouths, when water is available there, and others as near to large load centers as available condensing water will permit. These will, in turn, bring up the problems of still heavier trunk transmission lines. The last word has not yet been said regarding lightning protection. Improvement in communication circuits also offers a fertile field for study.

The foregoing statements, made by W. E. Mitchell, Georgia Power Company, and applied to the Southeastern section of the United States, indicate almost without exception the situation all over the country.

---

## Accomplishments in the Southeastern States

By W. E. Mitchell
*Georgia Power Company*

TREMENDOUS strides have been made in the last few years to increase the capacity of the interconnecting links between different systems, to develop water power distant from the power market and to construct mine-mouth or other strategically located high-capacity steam plants, and to connect them with the great load centers by means of high-capacity networks. By co-ordinating various operating companies under holding companies, the benefits of massed capital, massed resources and unified control have been realized. Interconnection, group management, low-cost steam generation and long-distance transmission have come as a logical succession of natural economic steps.

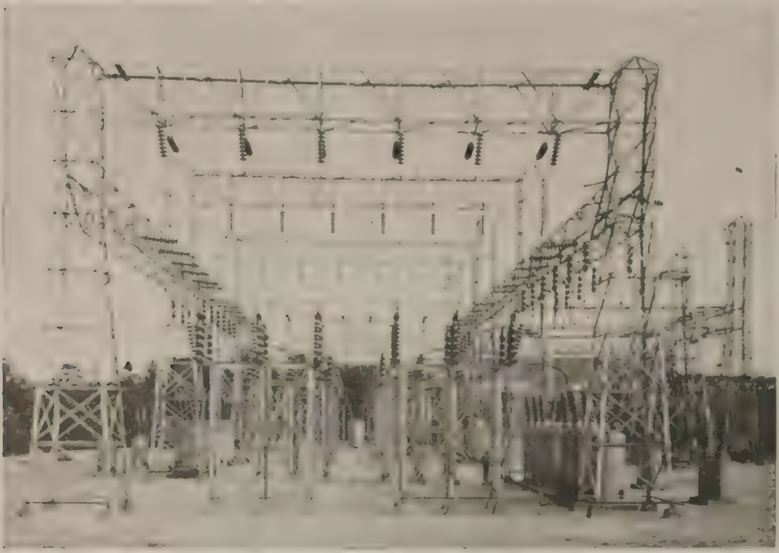
Interconnection between independent systems is, first of all, a measure of protection in emergencies. But it cannot be a complete success unless the executives and operating forces of the respective companies realize it is a give-and-take proposition and have mutual regard for each other's obligation to the public.

To stimulate the needed mutual interest the companies that are involved in the Southeastern interconnections have jointly formed an operating committee which meets about eight times a year and compares operating data, load, rainfall, storage reservoir conditions and problems of mutual interest. The resultant better understanding of each other's systems and their points of strength or weakness has facilitated the prompt handling of emergency power exchanges and improved operating economies.

Unquestionably great benefits can be derived from interconnections between independent companies or systems, but it is practically impossible for such companies to have a unified development program. If the companies are under the same financial, engineering and management control, then genuine system planning on a large scale will be practicable and the most economical plants and tie lines can be built first, because only the results for the group as a whole need be considered.

For successful parallel operation and to secure the proper load division between interconnected generating stations and systems, it is essential that the frequency be very closely controlled. This has been facilitated by the installation of master clocks at the larger generating stations and use of extremely accurate frequency recorders at load-dispatching centers. The system supplying the bulk of the power regulates the frequency. Special attention has been given to the adjustment of governors at all generating stations, so they will respond as uniformly as possible and enable each station to carry its share of load fluctuations.

Voltage control grows more important and more complicated as larger systems are tied together and as additional interconnections are made. To minimize this problem synchronous condensers with a total rating of 130,000 kva. are used on the Southeastern Power & Light Company's system, being controlled by automatic voltage regulators. During the wet season, when steam units are not required for supplying power, generators are disconnected and operated as synchronous condensers. During peak-load hours, and when not required for supplying power, the hydro-electric units are used for power-factor correction. Naturally such units are not as beneficial as synchronous condensers at load centers. However, they are generally at opposite ends of the system from the steam plants, so they serve to correct voltage.



EAST POINT SUBSTATION, CONNECTING GEORGIA AND ALABAMA SYSTEMS

It has not yet been found necessary to install regulating transformers in tie lines to govern the division of load and wattless current, but it is very likely that this or some other method will be required as the number of ties between the systems increases. With the increasing amount of load carried over the lines the problem of system stability has been encountered. Simultaneous readings of load, power factor, voltage, etc., have been found of considerable assistance in the system operation. In order to analyze troubles and provide remedies, permanent recording equipment, such as the Hall recorders, or oscillographs, are now being installed at strategic points on the system.

A great need exists for a system of relaying which, while selective, will instantly disconnect a faulty circuit. At present ordinary induction type overload relays are being used on single-circuit lines, a short time setting being provided to secure selective operation. In a few instances the settings of these relays have been such as to hold a short circuit on the system long enough to affect the system stability, and in one or two cases has resulted in rather serious interruptions. On the double-circuit tower lines balanced relays are functioning very satisfactorily. However, during lightning storms both circuits on the tower lines are frequently interrupted simultaneously.

The construction of some 154-kv. lines built recently brings out forcibly the economy of unified control. The lines considered permit the postponing of the construction of additional power plants by one company until those under way by other companies under the same control are loaded up.

As the systems grow larger interconnection between those under one management makes for greater operating efficiency, as full advantage can be taken of diversity of time, rainfall and seasonal load. Less benefits could be derived from these factors with ties between independent companies. With the large storage reservoirs practically no water goes to waste during the summer season. If one section has a heavy rain and another none the tie lines permit sale of the surplus at such a price that the company that has had no rain can afford to buy power and store its own water.

Run-of-river plants which formerly wasted water all night long because they had little or no storage now generate more kilowatt-hours because they are linked with a comprehensive system. By jointly studying the hydrographs of all rivers in the territory for the last 25 years and considering wet, dry, average and medium periods it is now possible to forecast available water fairly accurately a year in advance.

Operating and maintenance practice has also improved with the exchange of operating data and ideas, resulting in reduced maintenance expense and more efficient condition of equipment. Co-ordinated development and operation of plants has made it possible to develop more kilowatts of capacity per dollar of investment and to produce more kilowatt-hours at a lower cost than would be practical under independent management.

The improvement in steam-generating efficiencies, plant costs, the reliability of the large steam units and the varying character of Southern streams is making utility engineers in the South realize that a greater and greater proportion of power will be produced by steam in the future.

During 1927, as in 1925, the value of interconnection was emphatically demonstrated to the Southeast. Enabled by co-ordination of the systems and the tie lines water was conserved in the Burton storage all during the spring and drawn out in the late fall, when most needed. Under independent operation the tendency would have been to have taken a chance on getting summer rains (which never came), and so to have drawn upon the stored water that when the final pinch came there would have been none left. Then industries would have been forced to curtail because the tie lines could carry no more and the hydro plants would have been greatly reduced in capacity by lack of water.

Other striking examples of the benefits of interconnection were afforded the same year. A large cotton mill in Georgia had a failure in its isolated plant. Within 24 hours from the time notice was received the power company had picked up more than 3,000 hp. of the mill's load and within 72 hours the entire 10,000 hp.

Again when the flow of the Savannah River dropped nearly as low as in 1925, a local plant near Augusta was inadequate to carry its load for several months and 15,000 to 20,000 kw. was supplied over the interconnecting 110-kv. line.

Another example of the greater use of available resources: Company A had available 25,000 kw. of transmission capacity but no surplus generating capacity. It was interconnected on one side of its system with Company B, which had surplus power, and on the other side with Company C, which was short of power. Transmission facilities were leased from Company A, power purchased from Company B, and Company C's needs completely cared for.

The effect of interconnection on steam-generating plants is illustrated by consideration of one in Alabama. Whereas eleven years ago the first large unit installed at Gorgas was 25,000 kva., and the plant was built purely as a reserve steam plant to operate at from 10 to 25 per cent annual load factor, the new plant will be a base-load plant operating on a 50 per cent annual load factor at first and probably ultimately on a 70 per cent load factor. Another interesting fact is that while the new plant will be 50 per cent more efficient than the old, its cost per kilowatt will be but little, if any, higher; such is the effect of larger units. Again, units of 66,667 kva., which are used in the new plant, would not be the proper size were there not ample reliable tie lines between Alabama and Georgia so that such a unit would be available to both companies.

Transmission lines still constitute the weakest link in the chain between generating station and customer. After fifteen to twenty years' experience Southern operators feel sure that ground wires are justified on important lines. The new 154-kv. lines being built in Alabama and Georgia are being overinsulated, but the equipment is not. For its protection, a weak link will be put in the lines near the substations by leaving off two or three of the insulator disks. On the Southeastern Power & Light Company's system we feel that in the more important stations lightning arresters should be installed. Annual buzz-stick testing is favored for eliminating defective insulators and lines are patrolled after every interruption.

With the growth and interconnection of systems the necessity of uninterrupted communication circuits has grown in importance. Important stations and load-dispatching centers are usually coupled by several private land-line circuits as well as by Bell system lines. Extensive use has been made of the carrier-current telephone system with exceptionally good results. It is being used regularly for load dispatching over 1,000 miles of transmission lines.

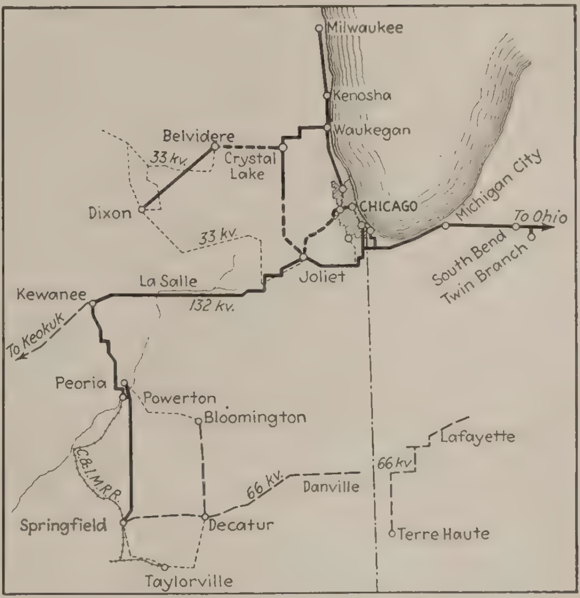
Oil circuit breakers continue to be one of the most important factors affecting satisfactory long-distance transmission and system interconnection. Here again the increase in capacity of transmission lines and the concentration of power necessitate ever-increasing capacity in the oil circuit breaker. Today short circuits of 1,000,000 kva. are possible in the Birmingham district. We believe we shall continue to give best service by operating with so-called solid ties as compared to the loose-link method, limiting short circuits by opening the ties at certain predetermined points. Later we shall probably add 110-kv. reactors through which no current flows normally.

# Interchange Arrangements in Chicago District

By H. B. Gear
*Commonwealth Edison Company*

MAXIMUM use of reserve generating capacity and low-cost energy is facilitated in the Chicago district by the provisions of a three-party energy-interchange agreement. This pools reserve capacity and permits the flow of energy to neighboring zones whenever the load in the immediate zone permits or when the energy so transferred costs less than that produced in the neighboring zone.

The difference between the total capacity in the pool and the coincident maximum load of the three systems is taken as the group reserve, until a higher maximum has been established or additional capacity put into service.



AT POWERTON, CLOSE TO THE COAL FIELDS, A BASE-LOAD GENERATING STATION IS BEING CONSTRUCTED

The percentage of group reserve is taken as the standard and any company having a reserve percentage higher than the group percentage is compensated for the carrying charges on its excess station capacity by the other company or companies whose percentage of reserve is less than that of the group. This permits the smaller companies to install larger units than would be possible if only the requirements of their individual systems were to be met, and thus gives them capacity for future growth at a lower investment cost, with higher operating efficiency.

Operation on this basis is not accomplished at the expense of the larger companies, except temporarily, as they are able to draw upon the excess capacity thus created and so defer, for a year or more, additions to their own plants.

Power-station construction for the entire district is co-ordinated through a committee of two representatives from each company. It studies load increases in the various zones and recommends to the executives the size and location of units to be added from year to year. The recommendations are made about two years in advance of the dates when the units are to come into service.

Reporting to this committee is a sub-committee of load dispatchers, which meets weekly to arrange operating schedules for the transfer of energy from the more efficient stations to other zones during off-peak periods, to co-ordinate removal of turbines for overhauling purposes and, in emergencies, to confer by telephone and arrange relief where it may be required.

The conditions which existed during one of the summer months of 1927 illustrate the way in which the energy-interchange agreement is accomplishing the result contemplated by the parties thereto:

SYSTEM CONDITIONS DURING A SUMMER MONTH IN 1927

| Company | A | B | C | Total Kilowatts |
|---|---|---|---|---|
| System maximum....... | 864,300 | 139,800 | 44,700 | 1,041,000 |
| Reserve capacity, kw.... | 101,245 | 97,980 | 2,075 | 201,300 |
| Reserve quota (19 per cent) | 165,875 | 26,240 | 8,585 | 201,300 |
| Excess and *deficiencies.. | *64,630 | 71,740 | *6,510 | ........ |

Company "A" paid Company "B" for 64,630 kw. of reserve capacity and Company "C" paid Company "B" for 6,510 kw. of reserve capacity. Thus Company "B" was reimbursed for an excess of 71,740 kw. in its reserve capacity. During the same month Company "A" delivered to Company "B" 9,135,000 kw.-hr., Company "B" delivered to Company "A" (in other zones) 16,936,000 kw.-hr. and Company "A" delivered to Company "C" 9,172,000 kw.-hr. Of the total of 35,243,000 kw.-hr. thus transferred, about 19,000,000 kw.-hr. were delivered during off-peak, resulting in a fuel saving of about $19,000 in that month.

Normally the three systems are operated in parallel with each other and with the Twin Branch station at South Bend most of the time. Parallel operation with the Milwaukee system is not normal, as this line is maintained, primarily, as a reserve connection for use in emergencies. Interconnections with companies west and south of the Chicago district are also operated, for the most part, as reserve connections and are paralleled only as operating conditions require it. These lines are of small capacity and are not suitable for other than local reserve service.

The interconnection of power stations by lines of relatively large capacity has resulted as follows:

(a) The size of generating units is increased, while the total capacity and reserve for a district is decreased.

(b) The investment per kilowatt of capacity in generating stations and the total investment are decreased.

(c) The consumption of fuel is reduced by ability to give the more economical units the "base load" of an entire district.

(d) The reliability of service is enhanced by increased availability of the capacity and reserve in generating units during emergencies and routine operating work, such as overhauling and repairing equipment.

Some problems require solution before an interconnected group may realize the advantages sought. These problems relate, chiefly, to the ability to control the division of energy between neighboring stations and to make delivery continuously when occasion requires. Experience thus far in the Chicago district indicates that these problems lie outside of the generating equipment almost entirely and relate to the size, voltage, length and other characteristics of the interconnecting lines.

When line capacity is high and lengths are short in proportion to the voltage of transmission the transfer of energy between stations is readily accomplished by governor control of the generating units. When lines are relatively long and have a capacity which is approached by the normal surges of synchronizing energy, which flow between the two sources of power, there is instability of operation, and lack of continuity is likely to result.

The presence of several successive transformations in a tie line has the effect of increasing its impedance and is, thus, equivalent to an increase in length. More than two transformations (one each way) are to be avoided in such lines, if possible.

With long lines or lines in which the direction of flow of energy is at different times in opposite directions it is often necessary that means of voltage control be provided. These are required to permit the receiving station to operate its bus at a voltage level suited to the requirements of the circuits supplying energy within its own area of distribution. In such situations transformers with tap changers, adjustable under load, are finding useful application.

At the higher voltages the use of synchronous condensers for voltage control are often found desirable through the ability to regulate the power factor of the system secured thereby.

# Pennsylvania-New Jersey Interconnection

By the Late W. C. L. Eglin
*Philadelphia Electric Company*

INTERCONNECTION ranges from ties of very small capacity between outlying points of adjoining or interpenetrating systems, which if utilized to the utmost could not materially affect the operating economies of the system taken as a whole, up to trunk lines connecting principal centers of load and generation, involving a comprehensive mutual program with large investment and promising commensurate return. To the latter class belongs the interconnection between the Philadelphia Electric Company, the Pennsylvania Power & Light Company and the Public Service Electric & Gas Company, the first step of which is now practically ready for operation. It is the purpose of the three companies by this interconnection so to co-ordinate their construction and operation programs as to result in a maximum saving of investment and operating expense. The studies made preliminary to the final agreement indicate that the present contemplated construction, namely, a complete 220-kv. ring between the systems with suitable facilities for connecting each system to the ring, will, when carefully operated, utilize to the best advantage all of the diversity occurring between the system loads for the coming ten years.

Each company will design and construct the lines lying within its own operating territory, although all three have agreed upon the climatic loading conditions and the general basis of design.

The principal saving in this case results from load diversity, in that the peak load of the combined systems is smaller than the sum of the individual peaks. By pooling the reserve capacities which the companies maintain they are able to dispense with a certain portion of this reserve without loss of reliability. Staggering of construction among the companies will make the installation of two or three generating units adequate in any particular year, where four or five might be required if the three systems operated independently. Distribution of the combined load so that the more efficient stations will carry the base load and the less efficient the peak loads will be a source of considerable saving in operating expenses. The furnishing of emergency power in excess of normal reserve requirements when this is available in the other companies results in no actual money saving, but does improve reliability of operation.

*Load Diversity*—In this interconnection the principal portion of the load diversity is due to the difference in the shape of the individual daily load curves on any selected day during the peak period of the combined systems. Further contributions are made by the difference in the season of annual peak and by the noncoincidence of those accidental high days which cause weekly or monthly peaks on the individual system. For example, the daily peak of the Pennsylvania Power & Light Company is in the morning throughout the year, with the afternoon load slightly lower and the evening load materially reduced. The annual peak load occurs in October. The load curves of the Public Service Electric & Gas Company and the Philadelphia Electric Company are quite similar, both having large evening loads throughout the year, and in particular a high peak near 5 p.m. throughout the winter months. The yearly maximum load of both usually occurs in December.

*Reserve Diversity*—The experience of the three individual systems with calls upon their own reserve generating capacity indicates that these are relatively infrequent and no loss in reliability is expected under the assumption that the interconnecting companies will not all require their share of the total reserve diversity simultaneously.

*Substation connecting Conowingo and Philadelphia System with Pennsylvania Power & Light and Public Service Electric & Gas Companies*

Plymouth Meeting substation, which will be the junction point for the 220-kv. lines from Conowingo, the 220-kv. loop connecting the three companies and the 66-kv. lines to Philadelphia will be equipped with three 30,000-kva. synchronous condensers initially. Self-cooled 220/66/13.3-kv., 100,000-kva. transformer banks equipped for ratio changing (15 per cent range) under load are installed. Air-jet radiator cooling will increase their rating to 130,000 kva. The condensers are connected to the 13.3-kv. tertiary windings and are equipped with extra high-speed excitation. Many unusual features of design are involved.

*Economic Distribution of Combined System Load*—In a single system of steam-generating stations, especially when serving a compact territory, the proper apportionment of load among stations seldom offers serious difficulties. It is usually found economical, as the system grows, to build up one station at a time from initial to ultimate capacity rather than to have two or more under way simultaneously. Thus each station in its operating performance reflects current practice during its design and construction period, and the cost margin between stations is sufficient to render the correct distribution of load obvious. Transmission limitations and minimum loading requirements of stations may enforce departures from this ideal distribution. In the case of a system of wide area and low concentration of load it may prove more economical to establish two or more centers of supply, and increase them in capacity according to the requirements of their districts, rather than to provide the transmission facilities required to permit all the growth to take place at one station.

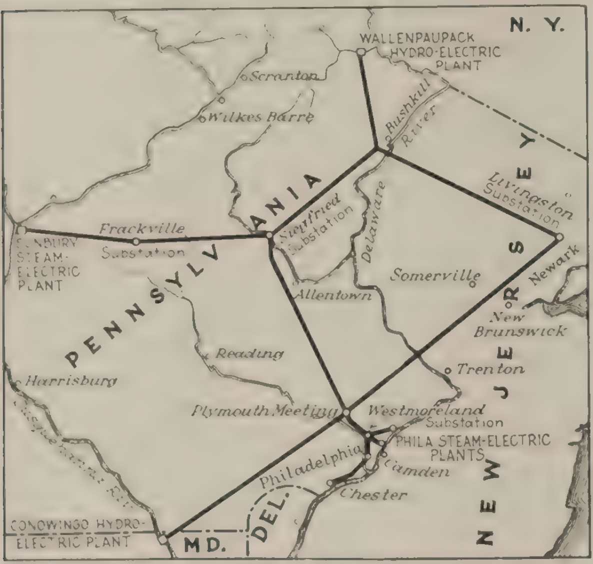
No matter to which class the systems concerned belong, the interconnection of two or more systems which have grown up entirely independent, and which are therefore likely to include stations of approximately equal operating performance, offers many delicate problems of load apportionment.

*Load Dispatching*—The interconnection headquarters for general administration and load dispatching is to be established at Siegfried. It will be advised of the expected outputs from the various hydro plants of the system as far in advance as estimates can reasonably be made, and will plan the operation of the steam stations to carry most economically the remaining load. The preliminary studies of the interconnection project have demonstrated conclusively that an opportunity for large savings exists, but only the most alert and skilled load dispatching will realize all of the possible benefits.

Relay protection on the 220-kv. lines consists essentially of special type C Z relays and directional, ground-current relays. Transformer banks and condensers have the usual differential protection. The 66-kv. lines are also protected by C Z and ground-current relays.

The 220-kv. oil circuit breakers have an interrupting capacity rating of 2,500,000 kva. and the 66-kv. line breakers a rating of 2,000,000 kva.

The Conowingo and interconnection projects have many favorable reactions upon each other. One of these is the common use of facilities for connecting the 220-kw. lines with the Philadelphia Electric Company's existing transmission system. The cost of Plymouth Meeting substation and of Westmoreland substation (66-kv. tie between Plymouth Meeting substation and Philadelphia), for either the Conowingo project or the interconnection separately would have been considerably greater than the proportionate share of the actual combined construction cost. Furthermore, a high-capacity, initial installation was imperative at Conowingo on account of the size of the dam. This precluded independent operation and building up of local load or transmission to existing load centers with provision of expensive steam-generating reserve for use in the low-flow periods.



THREE LARGE SYSTEMS POOL THEIR SERVICE FACILITIES THROUGH THE MEDIUM OF THIS LOOP

That the project has now become economically justified is because the Philadelphia Electric Company system load is large enough to absorb nearly the entire output of the plant at all times, while operation in connection with the existing steam stations in Philadelphia, utilizing Conowingo station as the base of the load in high flows and on the peak in low, makes relay steam capacity unnecessary.

The output of the Conowingo project can be completely absorbed earlier with the interconnection, since the minimum combined load of the three systems is well above the full load capacity of Conowingo station. Likewise, Conowingo's value in replacement of steam-generating capacity at all times of the year is greater with the interconnection.

# Pacific Coast Observations

By P. M. Downing
*Pacific Gas & Electric Company*

THERE are many instances where two or more independent systems are operating very successfully under interconnection agreements, but to obtain maximum benefits, control and management should be unified.

Although there are many arguments in favor of interconnection, the extent to which power systems can be advantageously interconnected has certain limitations beyond which there is no advantage in going. In the light of present knowledge the advantages of interconnection are regional in character and limited to a radius of 300 to 400 miles.

Interconnection between various sources of electric generation and distribution on the Pacific Coast was the inevitable result of environment and economic pressure. Along the route of these transmission lines, running from the hydro plants on the western slope of the mountains to the larger cities along or near the coast, were many small towns and agricultural communities supplied with power from isolated plants. Eventually most of these plants with the distributing systems became a part of a larger and more extensive network. When it is considered that the agricultural business is the least remunerative of any that is served, it will be apparent that the rural communities have benefited greatly by the fortunate fact that nature placed them between the source of power supply and the principal markets.

It is still desirable, if best operating results are to be obtained, to maintain a ratio between hydro and steam capacities that will place the base load on hydro and peak and emergency loads on steam. The ideal relationship depends upon such elements as load factor, relative capital costs of steam and hydro installations, cost of fuel, etc.

From the standpoint of continuity of service, steam plants play a less important part today than they did a few years ago. For example, the Pacific Gas & Electric Company, with a peak load of 439,568 kw. and an energy output of 2,380,000,000 kw.-hr., produced less than 0.9 per cent of it by steam. Several factors have contributed toward bringing about this change. In the first place, as the number of hydro plants feeding into an interconnected network is increased, temporary cessation of operation of one or more generating stations whose output represents a comparatively small percentage of the total has but little effect on the general service of the system as a whole. A similar situation obtains in the case of transmission lines. However, a much more important factor in improving service, in so far as transmission is concerned, is due to the better quality and design of insulators that are now available and the better and more substantial physical construction used.

Some of the chief factors that must be given consideration in the operation of interconnected systems are:

## *Important Benefits from Interconnection*

1. Greater reliability of service and increased economies. In cases of a shortage of power due to accidents to equipment, other similar devices on the interconnected system can supply the shortage until repairs are made or other units put into service. Under normal conditions, the more efficient units can be operated, the less efficient being held in reserve and operated only in emergencies.

2. Increased diversity, thus reducing the power requirements of the combined systems and, by improving the load factor, reducing the capital investment in plant facilities.

3. Common use of reserve or spare capacity, further reducing the capital investment in plant.

4. In cases where the network is supplied with power from both steam and hydro sources, the hydro stations can be operated continuously at full load when water is available, thus making a maximum beneficial use of water power and a minimum use of steam. On a smaller system there would be much less opportunity of doing so.

5. General availability of power over large areas, thus making it possible for factories to locate where raw material, labor, market conditions, etc., are most favorable. This is particularly important as it permits manufacturing plants to locate in smaller towns and agricultural areas and use labor normally employed during certain seasons only. In this way interconnection becomes an active force in the decentralization of population. P. M. DOWNING,

Vice-president Pacific Gas & Electric Company.

---

1. Dependable communication.
2. Centralized authority and control over operations.
3. Location and isolation of trouble.
4. Voltage regulation and control over the entire network.
5. Frequency control.

When trouble occurs on the power circuits the inductive disturbances are generally sufficient to make communication circuits on the same or closely adjacent structures inoperative when they are most needed. Much more dependable communication can be had over circuits independent of and located a sufficient distance from the power line to be out of range of inductive interferences. Recent developments in carrier-current equipment give promise of providing a cheaper and more dependable means of communication.

The success attending the operation of large interconnected networks is due in very large measure to the fact that authority and control over the details of operation are centralized in the load dispatcher. Among the more important responsibilities of this position is allocation of load among the generating stations, substations and lines in such a way that there is maximum use of the more efficient plants or equipment, conservation of water or fuel and readiness to meet any operating emergency. Under normal operations, these conditions can be met without any great difficulty, but once the regular operating routine is upset by storms, breakdowns, water shortage or otherwise, the resourcefulness of the load dispatcher may be taxed to the limit.

Where generating stations and switching centers are separated by several hundred miles there is always the liability of partial or complete failure of the communication circuits. To dispatch orders under this condition increased accuracy and saving of time have been effected by use of code numbers indicating prearranged instructions.

Localization and isolation of trouble have been greatly facilitated by substitution of relay-control for manual operation of switches.

As an interconnected network grows and the amount of power delivered into it increases, the necessity of having dependable switches becomes of increasing importance. The construction of high-voltage switches has been materially improved during recent years, but there has been practically no change in the general design. Failure to keep pace with the development of other facilities used in connection with the production and transmission of high voltages has made them the weakest link in a power system.

Thus far the vacuum type switch has given more promise of relief than any other that has been proposed. Laboratory tests have shown that there is practically no deterioration or damage to the contacts after opening a 15,000-volt circuit carrying 120 amp. more than 500 times. If this type of switch can be developed to a point where it can be used on a commercial basis there is every reason to believe that it will rapidly supersede the present oil type.

Condenser installations can be fully justified not only as a most satisfactory means of improving voltage regulation but they also have a tremendous economic value in that, by improving the power factor, the amount of power that can be carried over a given line is materially increased.

Frequently control on an interconnected system is a comparatively simple matter. Irrespective of the number, size or location of generating stations one station does the governing. Ordinarily the station near the load center, where a sufficient governing margin can be maintained at minimum cost, is selected. Where a hydro plant does the governing it is desirable that one having sufficient forebay capacity to supply the varying drafts necessary to meet load fluctuations be selected. Where the network is supplied from both hydro and steam sources, especially where the latter is operated as a standby or reserve source of power supply, there is but little, if any, economy in governing with steam. Maximum economy will be obtained by loading all hydro plants except the one doing the governing, thus reducing the steam load to a minimum and keeping only enough boilers hot to pick up the predetermined amount of load that is to be thus protected against interruptions in case trouble should occur.

To prevent seesawing of load between different plants the governors on the governing plant are adjusted sensitive enough to operate on a minimum variation in speed. Those on the other plants are adjusted to operate only on the wider variations that would occur if and when for any reason they might become separated from the governing station.

On a reasonably large interconnected network of lines, carrying a highly diversified load, the instantaneous variation in load, or what is ordinarily called the governing margin, is comparatively small. In fact, it is not at all unusual during short water periods to reduce this to practically zero and follow the gradual variations in load by hand control. On the system of the Pacific Gas & Electric Company, with a peak of almost 440,000 kw.-hr. supplied to an area larger than any other interconnected network in the West, the normal governing margin is between 1,000 and 2,000 kw.

## System Voltage Control

By C. P. Hubbard

*System Operator Detroit Edison Company, Detroit, Mich.*

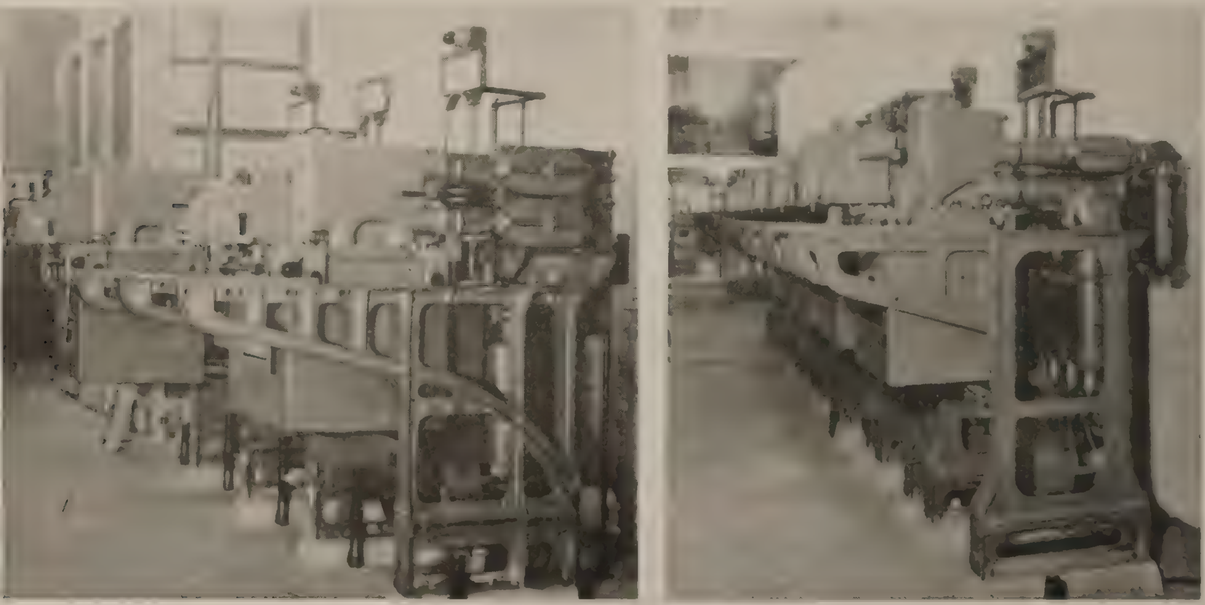
CONTROL of voltage on the Detroit Edison system from the generator busbars to customers' outlets is the direct responsibility of one man in the engineering division of the electrical operating department. Load conditions are not permitted to affect the voltages; that is to say, over- or under-voltage is not allowed at times of light or heavy system load. Except for a slight variation, caused by shifting wattless current from one plant to another, the generating-plant voltages are carried practically constant throughout the 24 hours of the day. Generator voltage is not regulated to compensate for system conditions caused by changes in load. The voltage schedules in the various elements of the system are maintained by tap chargers at switching stations and by synchronous condensers at the ends of long transmission lines. It should be observed that these synchronous condensers are more for voltage control than power-factor correction. The synchronous condensers are not operated at scheduled loads, but are controlled by the local station operator in accordance with voltage conditions at the particular point. The operator increases or decreases load on the condenser, or even removes the unit from the line or replaces it on the line entirely as the local voltage conditions warrant.

System voltages are checked both by voltage charts and by periodical testing. Bus voltages at generating stations are taken every half hour. Bus voltages at large switching stations are watched carefully and any deviation from normal is reported to the system operator at once. At attended substations a complete set of voltage and load readings are taken on three days each week, at 10 o'clock in the morning and during the evening peak load. These regular readings are supplemented with voltmeter charts taken at unattended points on the system.

It is the duty of the man in charge of voltage control to determine which taps are to be used on regulating transformers at the switching stations and to determine when these taps shall be changed by reason of changes in load. The usual range of the taps is in steps of 2½ per cent to 10 per cent above and below normal. The voltage on the transmission lines is kept as nearly constant as possible. Distribution voltage regulation is accomplished by regulators installed either on individual lines or on transformers feeding distribution buses. It is intended that these regulators shall care for all distribution voltage conditions and no attempt is made to regulate these conditions by changes of the transmission line voltage.

## Iron-Clad Equipment Saves Space in New Substation

REYROLLE switchgear is used throughout the new East 172d Street substation of the New York Edison Company. Energy is received at 13,200 volts, three-phase, and transmitted at the same potential to outgoing feeders, which in turn supply distribution transformers feeding low-voltage networks at strategic centers. Each incoming feeder is equipped with 330-kva. induction-voltage regulators and supplies three smaller distribution feeders.



SWITCHGEAR USED FOR INCOMING AND OUTGOING FEEDERS IS OF IRONCLAD TYPE

# Lightning Experience*

### Performance of different sections of 132-kv. line reduced to a common basis. Changes in tower design. Work done to reduce lightning troubles at stations. Efficacy of ground wire

By Philip Sporn
*Electrical Engineer American Gas & Electric Company*

WHEN a line goes out of service it is the business of the operating man to get it into service with as little delay as possible and afterward try to determine, if possible, what has happened. When the excitement of the emergency has passed this often results in a lack of evidence that will withstand critical analysis or give any real information as to what has happened such as would be of real benefit to future design. Keeping this in mind it is easier to understand why some of the records presented are in some respects incomplete. Examining the accompanying table it will be noted that the largest number of lightning outages occurred on the Twin Branch-Lima line. This line was in service for the full year and has a length of 128½ miles. Based on 100 miles of circuit, however, it is not at all out of line and checks up with similar performance on the Lima-Fostoria line and on the Philo-Crooksville line. On the basis of 100 line-miles the largest number of interruptions occurred on the Glen-Lyn-Roanoke line, but this figure is of course subject to the weakness that the line was in service for six months only, and there is no way of checking up whether the ratio employed for figuring the yearly number of interruptions was correct for the entire year.

## Where Greatest Interruptions Occurred

Of the lines that were in service for an entire year the largest number of interruptions per 100 miles of line was sustained by the Logan-Turner line. This is a line that has no ground wires and, in addition, passes through especially rugged country. The length of the insulator string on this line is particularly short (see tabulated values) being, in fact, shorter than that of any other line with the exception of the Windsor-Canton line. Expressed in circuit-miles, however, the record is rather good. In such cases involving a double-circuit line, however, the method of dividing the total number of interruptions by two and calling that the interruptions per circuit is questionable. It raises the question whether such a result can be compared with the number of flashovers on a single-circuit line.

To amplify: Consider the two top wires of a double-circuit tower line with both circuits subject to the same potential gradient. Upon the occurrence of a lightning discharge, chance will usually determine which one of the two circuits is to flash over first. This assumes, of course, that their arrangement is perfectly symmetrical and that they constitute the same phase wire in their respective circuits. A flashover having occurred on one of them, the question arises whether that flashover does not reduce the energy in the surface sufficiently to lower the head of the wave to such an extent that the second wire will not flash over. The fact that among all the double-circuit lines the maximum number of instances in which both circuits flashed over on any one line was only four against a total number of flashovers of twenty would certainly tend to indicate that some such explanation may be the correct one.

The Roanoke-Reusens line is third in the number of interruptions per 100 miles of line, but the figure for a whole year was again obtained by a ratio and is open to the same objection as the figures for the Glen Lyn-Roanoke lines. The Philo-Canton and the Windsor-Canton lines, in spite of the fact that the Philo-Canton line generally is exposed to more severe storms than the Windsor-Canton line, have practically the same record for the year 1926, when reduced to a 100-mile basis One of these lines, namely, the Windsor-Canton line, has two ground wires and is considerably lower than the Philo-Canton line, which has only one ground wire. The record during 1926 would seem to show that from the standpoint of reliability the Philo-Canton line, even though it has only one ground wire, has been put on a plane of reliability equal to that of the Windsor-Canton line. From the data gathered on the Glen-Lyn-Reusens line and Roanoke-Reusens line in 1926 it would seem that the ground wire on these lines was not so effective as it was on the other lines. The ground wire construction being in general the same on all of the lines, a possible explanation for the large number of flashovers may lie in the fact that the tower resistance over the lines as a whole is rather high.

## Apparent But Not Actual Immunity

An interesting line in the series is the Logan-Sprigg line. This line, of wood-pole construction, was originally built for 88,000 volts and was operated for a period of about five years at 44,000 volts. At the end of this time additional insulation was added and the line was cut over to 132,000-volt operation. The majority of the structures are two-pole A frames with ungrounded steel crossarms. The insulation is unusually liberal. For a while, when the line was first placed in operation, the operating records seemed to indicate an almost lightning-proof line, but detailed investigation has shown that this was not quite so. Considering the shortness of the line, namely 21 miles, the record is not particularly good, although again the record is open to the criticism that a full year's data were not available.

Only in one case has a line been out of service due to

---

lightning trouble on it for a period in excess of the time necessary to close the line back in service. The one case referred to occurred on May 18 on the Windsor-Canton line, where both circuits tripped automatically due to the breaking of two line wires. It is interesting to note that this occurred on a line that had been very conservatively designed from the standpoint of height above ground, but, on the other hand, it had practically no arcing protection. This again substantiates the point that in designing a line both preventive and remedial measures must be considered. Lowering a line, for example, will undoubtedly reduce the lightning voltage which may be induced on the line. Installing a ground wire will do the same thing. Both these measures are preventive. The purpose of the arcing protective devices, on the other hand, are decidedly remedial.

In every case during 1927 construction ground wire was brought into the station structure and, where the station structure design allowed, the number of ground wires brought into the station structure was made larger than the number on the line itself, all with the idea of reducing as much as possible the surge impedance of that portion of the system running from the last tower to the bus.

To limit definitely the amount of overvoltage that can be brought into the station apparatus a reduction in the insulating value on the first mile or so of the line coming into the station was made, all with the idea of making certain that the lightning strength of the apparatus connected to the bus was equal to, or greater than, the lightning flashover of the insulator string on the first mile of line.

Where the country did not absolutely demand it, the use of tower extensions has been kept at a minimum so as to keep the effective height of the line at a predetermined level, that level being determined, of course, by the tower design itself. In cases where the topography of the country permitted, the tension to which the conductor was pulled up was considerably reduced, resulting in a greater sag and a closer adherence of the conductor to the contour of the earth, with, of course, a net reduction of the average height of span above earth.

More attention was paid to the mechanical aspect of the arcing protection arrangements with a view to minimizing the effects of conductor vibration on the protection assembly itself.

Previously it was pointed out that unless a line was very low, generally steel tower structures, carrying power conductors of 44,000 volts and over, should be designed and installed with a ground wire. It is now believed that careful consideration should be given to the question of whether or not two ground wires would not in some cases be justifiable, with, of course, particular attention to the location of the ground wires as regards the main conductors. The experience with lines without ground wires, and particularly the experience obtained during 1926 on the Logan-Sprigg and Turner-Logan lines, would seem to prove definitely that it is very hazardous and extremely unwise to try to operate a line of the type under discussion without a ground wire. The limit to the voltage which can be picked up on an insulator string being the flashover of the string plus its supporting structure to ground, the likelihood of picking up voltages close to that limit will naturally be much greater without a ground wire than with it. This has been borne out by some of the 1927 experiences with klydonographs.

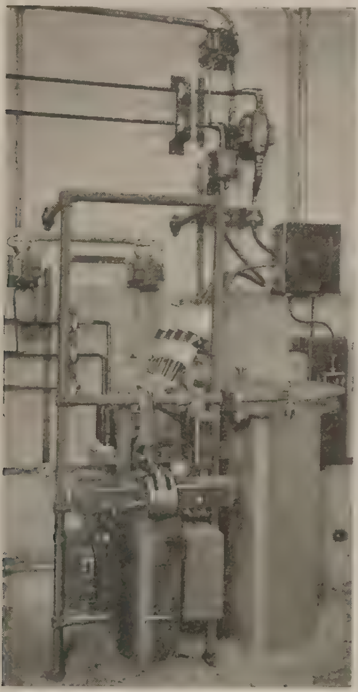
# Switch and Transformer Oil Testing

### Semi-automatic control of testing equipment expedites work. Chart record shows breakdown potential

By J. B. Wallace

*Detroit Edison Company, Detroit, Mich.*



SEMI-AUTOMATIC VOLTAGE CONTROL EQUIPMENT FOR OIL TESTS

THE STANDARD A.S.T.M. method of determining the dielectric strength of transformer and switch oils specifies (1) a definite settling time of five minutes for the sample in the test cup before applying potential; (2) a definite settling time of one minute between four succeeding trials, and (3) a constant rate of potential increase of 3,000 volts per second up to breakdown. Automatic recording of the breakdown kilovolts, while not specified, is also desirable to eliminate errors in observation of the swinging pointer on the voltmeter. To meet these requirements equipment has been developed for use in the high-voltage test laboratory of the Detroit Edison Company. Alternating current for general high-voltage testing is supplied by a motor-driven alternator with direct-connected exciter; the output voltage of this alternator is adjusted by a motor-driven main field rheostat with limit switches and can be varied between zero and 3,750 volts. The output of this alternator energizes the primary winding of the high-voltage test transformer, which is rated at 50 kva. with a ratio of 2,300/100,000 volts. A standard oil-circuit breaker connects the alternator output to the test transformer. This circuit breaker is operated by a G.E. type MK-1 reclosing mechanism actuated by a single-phase repulsion induction motor and fly-ball weights. This mechanism has been equipped with two potential trip coils, one of which is arranged for manual trip, remotely controlled, and the other is operated by a current relay in the secondary of a current transformer in the bus run between circuit breaker and test transformer.

BENCHBOARD FOR CONTROL OF DIELECTRIC TESTS OF OIL

The timing cycle is controlled by a Westinghouse periodic reclosing relay, which is a d.c. motor-operated drum type relay, arranged to control four circuits. Control energy is furnished by a 2$\frac{1}{4}$-kw., 125-volt d.c. generator which is a.c. motor-driven. Energy for indicating lamps, alarm circuits, etc., is taken at 115 volts a.c. from a 1-kva., 230/115-volt auto-transformer across one phase of the a.c. supply to the motor-driven control generator. Operating controls and indicating instruments are concentrated on a benchboard control desk inside the test inclosure, while the timing and set-up relays are mounted on a wall panel immediately adjacent.

An Esterline-Angus recording voltmeter was rebuilt, with a spark recorder substituted for the usual inking tube. The pointer is of wood, with a vertical metal pin at the recording end and a metal segment just above and extending along the travel of the pointer. A spark coil, mounted in the case, is connected through a small transformer to the current trip relay contacts, and this arrangement causes a spark to jump, at the moment of breakdown, from the metal segment to the pointer pin and through the chart to the chart table, thus marking the breakdown voltage with a small puncture in the chart. A small solenoid, actuated through the contacts of the circuit breaker closing relay, advances the chart one space between successive trials. The chart table has been made wider to facilitate writing oil sample identifications on the record, and the pointer is separated from the writing space by a heavy curved glass barrier. The entire recording assembly is mounted in a movable desk equipped with rubber roller casters and a three-circuit, six-conductor, flexible cable from the recording instrument is arranged to plug the three circuits simultaneously into the proper terminals of a six-point jack on the benchboard. The oil-test cup used with this equipment is an adaptation of the standard Westinghouse cup provided for use in dielectric breakdown tests of oil.

The indicating and alarm circuits are energized and control generator voltage is adjusted to a point at which the main field rheostat motor will raise the test voltage at a rate of 3,000 volts per second. This point has been predetermined.

The alternator is started and brought up to speed with voltage at zero. The oil-test cup is cleaned, dried, rinsed and sample poured in. The timer motor circuit is closed at the benchboard and the timer started manually. After 4½ minutes elapsed time a set-up relay establishes the closing circuit up to the timer contacts. After five minutes the timer closes the circuit and stops, the main circuit breaker closes also, closing the auxiliary switch and starting main field rheostat motor in "raise" direction. The voltage increases at 3,000 volts per second to oil breakdown. At breakdown the current-trip relay closes one circuit to the recording voltmeter spark coil and one circuit to the trip coil.

The main breaker opens, opening the "voltage-raise" auxiliary switch and closing the "voltage-lower" auxiliary switch and timer-motor circuit. The main field rheostat returns to zero, while the timer runs one-half minute to the set-up point. One minute after the first oil breakdown the main breaker closes and the second run-up to breakdown is made. This cycle is repeated for a total of five breakdowns. After the fifth breakdown the main field rheostat returns to zero, the timer closes an alarm bell circuit for five seconds and the timer-motor circuit opens through a timer-drum contact. It cannot again be closed until the timer drum is manually rotated to the starting position.

The testing cycle is repeated twice and the mean of the averages of the three series of five trials each taken as the dielectric strength of the oil under test in the standard gap used. Using this equipment, the standard A.S.T.M. oil test can be completed on a given oil sample in about 40 minutes and requires less than one quart of oil.

# Reducing Distribution Losses

NINTH ARTICLE

## *Graphic Ammeter Tests*

By J. B. Moorhouse
*Electric Distribution Engineer Central Illinois Public Service Company, Springfield, Ill.*

LOAD-CHECKING graphic ammeters are mounted in two-compartment steel boxes similar to those used for voltmeters and illustrated in a previous article of this series. A receptacle must be provided for a lamp or heater unit inside the steel box in order to keep the clocks warm during cold weather. A 25-watt lamp gives off sufficient heat if the door of the box fits properly.

In checking distribution transformer loads on either the primary or secondary side a current transformer must be used. A check on the secondary side is preferable in that: (a) Service need not be interrupted while connecting instruments; (b) connection of instruments on secondary voltage is less hazardous; (c) the current balance on the two legs of the transformer can be obtained.

All graphic ammeters on the market today operate at a relatively high load. To insure accuracy of results special solid core current transformers are used by the Central Illinois Public Service Company. Compensation, correct for use with Westinghouse type "U" graphic ammeters, is provided for by removing secondary turns of the winding. Variable ratio primary is provided by tapping the primary winding. In order to check all sizes of distribution transformers from 3 kw. to 37½ kw. ratios of 200, 100, 50 and 25.5 amp. are most convenient. These ratios, being in even multiples of five, are readily applied to the 0-5 amp. scale of the chart.

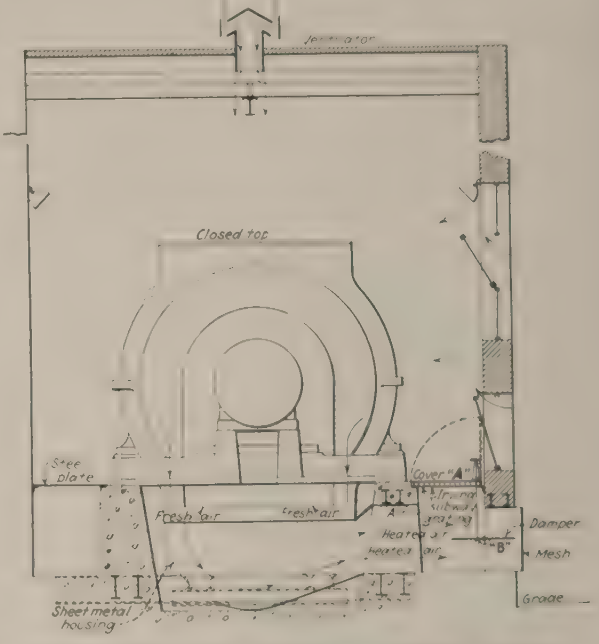
# Securing Clean Air for Synchronous Condenser

### Low intake velocities and selected entrance points reduce air impurities in machine ventilation

By H. W. Herrlich
*Electrical Design Engineer Utica Gas & Electric Company*

DUE to local conditions, a closed, circulating, air-cooling system could not be used in the installation of a 15,000-kva., 13.2 kv. synchronous condenser at the Washington Street station of the Utica Gas & Electric Company.

The proximity of the station to a water gas plant and to a large boiler plant compelled the greatest caution in the drawing in of free air, as a considerable deposit of fine cinders covered the ground for a great distance. It was therefore decided to draw in the required amount of air for cooling with the least velocity. This could quite readily be accomplished through the roof ventilators, windows and doors. Normally, the air is discharged through a screened opening on the side of the building, as indicated in the sketch, but during cold weather the butterfly damper, *B*, is closed, the cover plates, *A*, lifted, and the heated air enters the room. Almost all of the switching equipment is located in the same room with the condenser and is kept practically free from deposit of cinders. The condenser has been in constant use since the spring of 1923 and has shown at the annual inspections of the plant that there is practically no abrasive action on the coils and a very small deposit of cinders and dust.



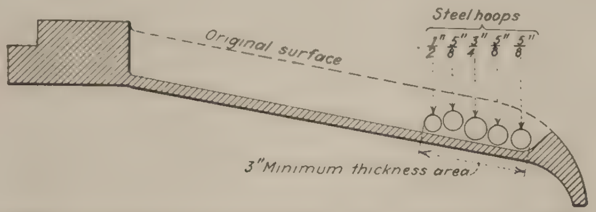
COOLING SYSTEM AVOIDS ENTRANCE OF EXTRANEOUS MATERIAL

The air ducts are free from goosenecks, short bends and other obstructions, permitting the condenser to carry considerable overload, without exceeding the guaranteed temperature rise.

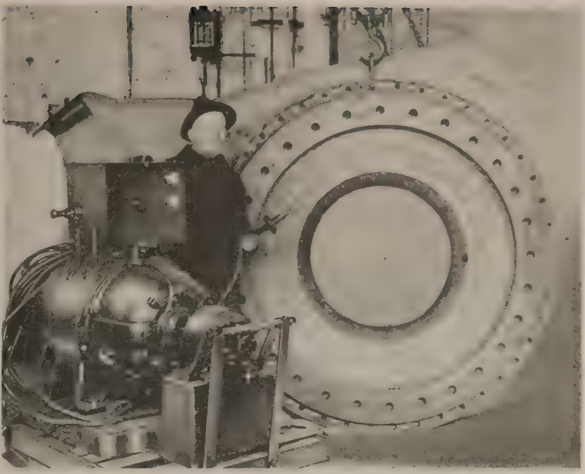
# Electric Welding Saves Waterwheel Casing

A SERVICE interruption of three months, the investment of about $1,000 in a new casing and loss of power during a high-water period were saved recently in a New England generating plant by electric welding, at an expense not exceeding $175, applied to a leaky hydraulic turbine. Describing this job before the Affiliated Technical Societies of Boston, C. W. Babcock, sales engineer Boston office Westinghouse Electric & Manufacturing Company, stated that the wheel in question ran under about 150 ft. of head and had been patched from time to time until leaks through the casing forced a shut-down. The wheel manufacturer quoted three months' delivery and a price of about $1,000 on a new casing, but the company could not wait for this. It was decided to try arc welding as a last resort.

During years of operation the outboard and thrust bearing had worn gradually, and the runner moved laterally until it touched the casing and wore away a section about 10 in. wide and 1 in. deep entirely around it. In one place the casing was worn through and in other spots it was from $\frac{1}{16}$ in., or less, to $\frac{1}{4}$ in. thick. A patch had been placed over the weakest parts. Owing to the extreme thinness of the iron near the inside radius of the worn section it was impossible to weld or deposit metal on the casing itself. The arc would have burned through as fast as established. This space was, therefore, bridged by a series of steel rings welded together and to the casing, and the remainder of the area welded in, as indicated in the drawing.



SECTION OF CAST-IRON WATERWHEEL CASING, ELECTRICALLY WELDED



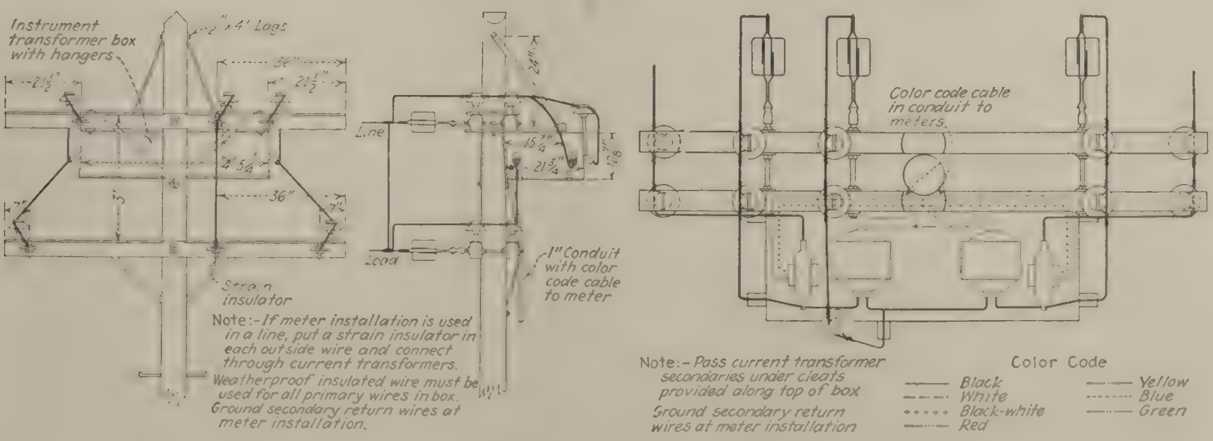
CASING AFTER WELDING AND PORTABLE WELDER USED

In handling this work a $\frac{5}{8}$-in. ring was welded to the neck of the casing. A second hoop of this size was placed outside the first and welded to it across the top. A third hoop, $\frac{3}{4}$ in. in diameter, was then put in place and welded to the second. A fifth ring $\frac{1}{2}$ in. in diameter, was then placed at a distance from the third that the fourth hoop, $\frac{5}{8}$-in. diameter would be raised up from the cast-iron when finally put in place. The fifth hoop was welded to the casting on the outer side. This was done to prevent the fifth ring from pulling or shrinking from the cast-iron, as it might have done if first welded to the fourth. The fourth hoop was then dropped into place and welded to the third and fifth rings. A small piece was cut out of each ring before welding, to allow for expansion, and the gap filled in later. These gaps were staggered. This made a strong bridge over the thin section and the entire remaining area was welded in without great difficulty.

While welding directly on the cast-iron, the welder ran a bead of only 1 or 2 in. at a time in one spot, and a helper immediately peened this with a hammer to strengthen it and avoid porosity. The first layer of welding to the cast-iron was done with a special grade of welding wire for cast-iron, succeeding layers being put on with ordinary steel welding wire. After welding, the high spots were ground off with a portable wheel, the reinforcing patch outside the casing being left in place,

---

# Three-Phase Pole-Top Instrument Transformer Box Installation



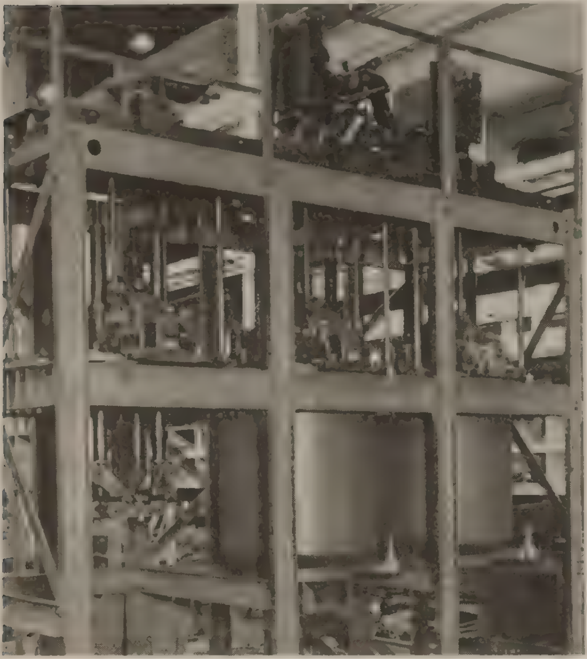
Note:—If meter installation is used in a line, put a strain insulator in each outside wire and connect through current transformers. Weatherproof insulated wire must be used for all primary wires in box. Ground secondary return wires at meter installation.

Note:—Pass current transformer secondaries under cleats provided along top of box. Ground secondary return wires at meter installation

*Standards of West Penn System*

as there was no object in removing it. The job was done in one week by a welder and helper. About 250 lb. of welding wire was used. A Westinghouse 200-amp. single-operator arc welder of the motor-generator type was employed, and about 300 kw.-hr. were consumed.

## Mechanical Strength a Feature of 2,500,000-Kva. Circuit Breaker



NO PORCELAIN is used in the construction of a new type high capacity breaker now being built by the Westinghouse Electric & Manufacturing Company, as this material is considered to be inadequate to meet the mechanical stresses that may occur. The manufacturer believes that this type of equipment, which is supplied for 15,000- and 220,000-volt service, will meet any system capacity needs for some years to come.

# Letters from Our Readers

### *Designing Plants in Economic Units*

*To the Editor of the* ELECTRICAL WORLD:

Alfred Iddles has employed the logical method* in attempting the solution for the most economical set of proportions. He first divides the plant into sections, each of which may, by itself, be treated as an economic unit.

The first economic unit is the steam-generating plant. Having determined which of the sets of conditions investigated is most economical for the steam-generating plant, he next, for the resulting operating conditions, finds which of the sets of conditions investigated is most economical for the power-generating section of the equipment. The latter section of the plant is thus the second economic unit.

In general, it may be stated that there is a set of proportions for any structure which will prove most economical. The discovery of this particular set of proportions is predicated, first, on ascertainment of the economic units into which the structure or system may be broken up. An economic unit is a part of the system such that the variations considered have little or no influence on the cost of operation in the part of the plant extraneous to the unit under consideration. Thus it is implied in the method of analysis here outlined that variations of proportions in the steam-generating plant will not materially influence the cost of operation in the power generating plant, and vice versa.

The economic factor is that expression which in general terms expresses in some way the cost of operation of the economic unit. It includes terms whose magnitudes are fixed when the physical proportions and load conditions are fixed and whose value changes when any one of these conditions is altered.

Curves plotted between axes, one of which is the economic factor value and the other some physical proportion of the unit, may be called the economic characteristic and show at a glance what is involved economically when the proportions of the unit are altered.

Usually such curves may be arranged to show maximum or minimum values at the best set of proportions, depending upon whether the economic factor is set up to express a saving in money or total cost of operation.

Mr. Iddles has chosen, for the sake of simplicity, to fix the surfaces in the economizer and air preheater. His conclusions, then, regarding whether or not economizer and, or, air preheater surfaces should be installed, apply strictly only to the amounts of surface in question. There may be and probably are smaller extents of both types of surface which would prove economical in use, even though the interpretation placed on the results is that in some instances economizers and, or, air preheaters are not economical. The reader might well be referred here to a recent paper by Mr. Van Deventer entitled "Economics of Air Preheater Applications," A.S.M.E. national fuels meeting.

The economic factor as set up by Mr. Iddles is thus restricted in certain proportions and represents directly differences in operating costs for the several sets of conditions chosen, and the only conclusion justifiable is that some one of these sets of conditions is more economical than another. But to say that because, for instance, Case I is more economical than Case II air preheaters are not justified is obviously a generalization based on insufficient information. All that may be said is that as much air preheater surface as is included in Case II is not justifiable. The conclusions stated under (2) on page 194 are thus subject to the above criticism.

Perhaps the same type of criticism may apply to conclusion (3) on page 194, as in view of our experience with both pulverized fuel and stoker fired boilers it is difficult to believe that it is generally true that it will take nine-dollar coal to justify the use of a pulverized coal system of the bin type. If this is so, then there is still the unit system, which, although mentioned by the author, has not been brought into the discussion. Obviously, the high fixed charge and maintenance account which handicaps the bin type system in this analysis would have to be greatly reduced for the unit system.

PROF. W. J. WOHLENBERG.
Yale University.

*"*Economy of High Efficiency in Medium-Sized Power Stations,*" ELECTRICAL WORLD, *page 189, Jan. 28, 1928.*

# Digest of Electrical Literature

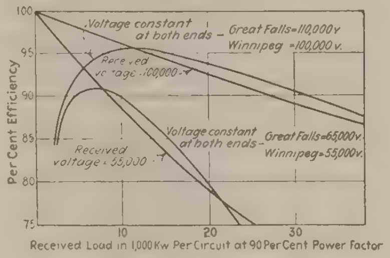
## *Generation, Control, Switching and Protection*

*The Klingenberg Power Station, Berlin.*—This station has a present capacity of 270,000 kw. and renders the city of Berlin independent of outside electrical sources. The various features of the station, including the method of receiving the coal, and steam and electric generating data and features are given. Steam is generated at 514 lb. per square inch and 797 deg. F. The boiler drums and superheater-tube suspension offer unusual features. All the combustion air is preheated to 302 deg. F., a portion of it being extracted and mixed with cold air for use in the primary air-fuel mixture. The remainder is drawn by suction into the combustion chamber. The generating equipment consists of three sets, each having an output at a continuous rating of 100,000 kva. Each set consists of a main machine of 80,000 kw. capacity and an auxiliary machine with an output of 10,000 **kw**. The turbines operate at 478 lb. per square inch and 752 deg. F. Each consists of a triple-expansion cross-connected turbine with twin low-pressure portions and drives two generators of equal output. The two parts of each turbine are arranged parallel and alongside one another, each set being placed one behind the other along the longitudinal axis of the turbine room. Control is obtained from a main control room, where an instrument indicating the conditions on the steam and electrical sides allow a close supervision of all operations. Transformers raise the generator voltage of 6,000 to 30,000 volts and are connected directly to the 30,000-volt bus bars for subsequent distribution. — *Engineering (England)*, Jan. 13, 1928.

## *Transmission, Substations and Distribution*

*The Grounding of a Long-Distance Transmission Line Compensated Through Petersen Earth Coils.*—Takashi Ohtsuki. — The author has endeavored to cover the subject of the grounding of long-distance transmission lines, and the general equations of a transmission line grounded at any point on the line with any treatment of its neutrals have been derived with consideration for all distributed line-constants so that an accurate tuning condition of the earth coils may be obtained. The electrical conditions resulting from the accidental grounding of a line are theoretically investigated for various probable causes so that the number and location of earth coils on a transmission line for the most favorable results are covered. It is stated that for practical purposes it is generally sufficient to take into account only the total line capacitance in order to determine the necessary compensating value of the earth coil on the comparatively short line, but that when the line to be compensated is longer it is increasingly important for the accurate tuning of the earth coils to be considered in connection with the line inductance. Formulas for the three-phase transmission line are derived and comparison with those for a single-phase system with general tuning conditions of the earth coils permits the establishment of an expression for symmetrical $n$-phase, $n$-line system. The effect of the third harmonic electromotive force acting on the system is discussed with relation to the treatment of the neutral point.—No. 14, *Selected Papers from the Journal of the Institute of Electrical Engineers of Japan.*

*110-Kv. Great Falls-Winnipeg Line.*—L. M. Hovey.—The new transmission line of the Manitoba Power Company is described in this article in connection with the design features involved and the considerations which influence their determination. Two-circuit steel-tower transmission lines are used with some unusually high structures and with long spans. Steel-reinforced aluminum conductors have been utilized in this installation. The features of the synchronous condenser operation and of the river crossing cables are developed. The methods of calculating performance of lines are given and the computed variation of efficiency with the received loads under potentials of 55,000 and 100,000 volts are also given.—*Electrical News (Canada)*, Jan. 15, 1928.



EFFICIENCY LOAD CURVES FOR TRANSMISSION LINES

*Series A.C. Transmission.* — Henry M. Sayers.—A discussion of the possibilities of the distribution of alternating-current electrical energy in certain areas by means of a constant current primary-ring main circuit with variable current secondary or load circuits. A definite scheme is offered for the practical application of this idea. The growing demand for electricity supply in rural areas is said to be satisfied economically by the plan outlined by the author, who also offers as an example a solution for a specific distribution problem to which his plan might be applied.—*Electrical Review (England)*, Jan. 13, 1928.

## *Units, Measurements and Instruments*

*Cathode-Ray Tube for General Alternating-Current Measurements.*—Mrs. Z. Tscherdanzev. — With the aid of a Brownian tube and a few properly dimensioned deflection coils most of the conventional a.-c. measurements can be readily performed with a high degree of accuracy. This little known and utilized fact is described in this paper. Current, voltage, frequency and power-factor measurements require but few accessories and a simple calibration. If higher harmonics are to be evaluated a basic sinusoidal wave must be available, which can best be derived from a small magneto-motoric induction machine. The Brownian tube can also be used to show to large audiences the characteristics of synchronous machines, commutator machines and other electrical machines and apparatus. It is claimed that for school or lecture purposes this method of measuring and demonstration is less expensive than the commonly employed double or triple element oscillograph.—*Elektrotechnik und Maschinenbau*, Jan. 15, 1928.

*The Hall High-Speed Recorder.*—E. M. Tingley.—A new form of oscillograph for recording fault currents and their voltage-disturbing effects in electric power systems is described. Representative records are analyzed and further applications of the instrument are suggested. Tests were conducted in connection with the operations of a large power company, and, in the opinion of the author, the high-speed recorder proved its value for such work. The recorders have been found to be useful for oil circuit-breaker tests and for measuring effects of test currents upon the system. The long time scale allows the starting of the instrument by telephone orders and consequently involves no lost intervals such as occur with other methods. Both generator and substation voltage disturbances may be accurately measured with the instrument.—*Journal American Institute of Electrical Engineers*, January, 1928.

## *Heat Applications and Material Handling*

*Electric Home Cooking.*—F. Marti. —The author investigated the status of electric home cooking in a number of European countries with the object of further stimulating its application in Switzerland. Of the 750,000 Swiss homes, one-half cook with gas and 100,000 have electric stoves. Full electrification would require annually 600,000,000 kw.-hr., which could be taken care of by the new hydro plant at Ryburg alone. Statistical data which have been collected by the author indicate that 1 kw.-hr. is required per person per day when meals are cooked electrically with the customary type of hot-plate stoves. The resulting load is exceedingly irregular, calling for three short daily demands, with the highest and sharpest peak near noon. A much more desirable load character could be secured for the central station by a more general use of the heat-accumulating type of stove, the heating element of which remains connected for sixteen hours per day, transmitting its heat to a well-lagged heavy metal block. Several constructions of such stoves are described, in particular Scandinavian types, of which excellent performance records are available, Comparing the current consumption of a hot plate and an accumulating type of stove, the latter requires about 17 per cent more energy, but since long periods of heating fall into off-peak periods with a lower rate, the total kilowatt-hour expenditure is less. A large number of practical statistical data are given from cooking experiences in several European countries. —*Bulletin de l'Association Suisse des Electriciens*, January, 1928.

*A New Electric Welding Set.*—C. H. S. Tupholme.—The apparatus consists of what the designers call a compensated rotating transformer capable of giving 60 or 30 volts alternating current with a drooping characteristic similar to that of the direct-current welding generators. Although employing alternating current, it is possible to weld at 30 volts with a current of 200 amp. In this equipment the rotary transformer acts as a static transformer while the motor is stationary, but as soon as the latter starts the primary winding rotates inside of the secondary, inducing a current, the frequency of which varies with the speed of rotation. It is possible to synchronize the single-phase pulsations in the welding circuit with that of the current in each of the supply lines, whatever the number of phases. The rotary also acts as a generator and can be constructed to give a wave form which will produce perfect conditions for efficient arc manipulation.—*Electrical Review (England)*, Jan. 20, 1928.

## *Telegraphy, Telephony, Radio and Signals*

*The Short Wave Limit of Vacuum-Tube Oscillators.* — C. R. Englund. — An investigation of the short-wave limit of vacuum-tube oscillators of the normal type where regeneration builds up oscillation in a resonant circuit indicates that the physical limits for ordinary commercial tubes lie between 3.5 and 1.5 m., depending on the type of tube used. By means of a special tube a wave length of 1.05 m. was obtained. No frequency control was left at this wave length. With a small power tube, deviating but slightly from ordinary vacuum construction, it was possible to operate at 3.5 m., with adequate frequency control, and it is concluded that the 3.5-5-m. range is available for technical purposes. The apparatus utilized in the measurement of wave lengths and the methods used in computing capacity and inductance under the conditions of this test are included. —*Reprint B-278 Bell Telephone Laboratories, Inc.*

## *Electrophysics, Electrochemistry and Batteries*

*Chromium Plating.*—S. Wernick.—The fundamental considerations involved in the somewhat recent development of chromium plating are reviewed by the author. Statements regarding the wear-resisting surface offered by this metal and the technical problems which must be solved in its application to other metals are offered in connection with a consideration of the chemical and physical properties of the material. The process of deposition and the apparatus required for satisfactory results are reviewed. It is stated that chromium cannot be suitably cast into anodes for use in the electrolyte and that even were this possible a serious drawback would be involved in the rapid rate of dissolution of the anode as compared with the deposition of metal at the cathode, rendering the proceeding impractical. The factors which require the use of lead anodes are reviewed. It is stated by the author that the actual cost of chromium plating may be considered to vary from less than twice to five times the cost of nickel plating, depending upon the facilities available and the general organization of the plating shop.—*Electrical Review (England)*, Jan. 13, 1928.

*Electro-Thermic Saw.*—O. Neiss.—A circular saw for cutting heavy structural steel sections quickly and cleanly is the subject of this article. Experiments carried out by the author showed promising results if a low-voltage but high-intensity current is passed between the blade of a circular saw and the metal to be cut. The arc formed at the cut liquefies the metal and hastens the cutting speed very materially. The first saws built used the secondary of a transformer to provide about 16 volts and 5,000 amp. It was found, however, that such a saw has many disadvantages, such as short life of the blade, a poor power factor and a very irregular load demand. Conditions could be improved only if direct current could be used for the cutting. An ingenious and entirely novel machine design was therefore dedeveloped by the author, combining the saw with a unipolar type of dynamo into one unit. The cylindrically enlarged saw arbor serves as the unipolar inductor, with excitation coils placed around it and the hub of the saw blade. Several sets of brushes collect the current from the arbor. An effective voltage of about 10 at 4,000 amp. is available at the cut. The saw is driven by a 2,000-r.p.m. motor. The blade has a diameter from 30 to 60 in. A 12-in. I-beam can be cut in twenty seconds, requiring only 0.28 kw.-hr.—*Elektrotechnische Zeitschrift*, Jan. 19, 1928.

*Electric Storage Batteries.* — E. C. McKinnon.—The author offers a general review of the subject of electric storage batteries as applied to generating and substation work. A description is included of a portable instrument which may be inserted in the water used for electrolyte make-up purposes for instantaneous determination of its suitability for such use. This device consists essentially of two platinum electrodes so arranged that when they are immersed in water containing a definite percentage of chlorine a specific current will pass under the pressure of a standard potential. Calibration has been so arranged that suitable make-up water will cause very small deflections to be recorded upon the scale, while unsuitable material will be given a high reading. Various procedures suggested for insuring satisfactory operation and long life of storage batteries are suggested by the author as a result of a review of contemporary British practices which are indicated as having given satisfactory results. — *Electrical Review (England)*, Jan. 13, 1928.

## *Miscellaneous*

*The Dvorkovitz Carbonization System.* — The recent tendency in low-temperature carbonization processes to exceed 500 deg. C., rather than to fall below it, produces a great amount of cracking of the oil vapors in the carbonizing effects. A practical difficulty has entered the situation in that the charge tends to become cemented together by its plastic constituents before the oils have been sufficiently removed. This caking impedes both the penetration of heat into the mass and the escape of oil vapors before they are cracked and with some coal and retorts may hold the charge in the retort and interrupt the progress of the operation. An experimental unit has been installed to enable an exact investigation to be made from coal used in commercial carbonization processes. — *Engineering (England)*, Jan. 20, 1928.

*Control of Cable Impregnation.*—P. Junius.—What seems to be a much more reliable control of impregnation is described. The principle of the new treatment is that when the raw cable is placed in the tank its conductors are connected to an airtight multi-outlet plug in the vacuum tank cover. During the entire drying process continual electric records can be made of the condition of the cable within the tank. Since the dielectric loss of raw paper is 1.8 to 2.6, while that of oil-impregnated cable paper is 3.4 to 4.3, the process of impregnation can be controlled by continuous measurements with an a.-c. bridge method. In addition, impregnation increases the capacity of the cable, so that capacity measurements can be made to check further the proper treatment of the cable and to determine the point beyond which the quality of the cable can no longer be improved by the application of impregnating materials.—*Elektrotechnische ueitschrift*, Jan. 12, 1928.

# News of the Industry

## Trade Commission for Thorough Inquiry

### Invokes Its Own Powers to Make Legality of Investigation Beyond Question—Joint Committee Offers Its Aid—Muscle Shoals Now Unfinished Business

By Paul Wooton
*Washington Correspondent of* Electrical World

IMMEDIATELY upon the passage by the Senate of the Walsh resolution, as amended by Senator George, the Federal Trade Commission began its preparations for the handling of the work. It is very evident that the commission has been put on its mettle by the charges made in the Senate, and a very thoroughgoing job is in prospect.

In view of doubts expressed on the floor of the Senate as to the power of the commission to comply with all features of the resolution, the commission has invoked its own powers to initiate investigations in order to remove any doubt as to its authority to investigate at the behest of a single branch of Congress. It was pointed out that the commission has the right to initiate an investigation covering every phase of the inquiry ordered by the Senate. Immediately on receiving official notice that the resolution had been approved the commission adopted the following resolution:

> Whereas the Senate of the United States has by a resolution agreed to on Feb. 15, 1928, directed the Federal Trade Commission to make an inquiry into certain practices and conditions relating to specified classes of public utility corporations and corporations connected therewith, now, therefore, be it
>
> Resolved, that an inquiry shall be undertaken immediately by the commission in strict and full compliance with the terms of the said resolution, and that in the prosecution of said inquiry the commission shall rely on and employ the powers conferred on it to make investigations at the direction of either house of Congress, and any and all powers conferred upon it by law to conduct inquiries on its own initiative or otherwise, and any other powers legally available to it, whether contained in its organic act or elsewhere, which may conduce to a diligent and complete performance of the ends and purposes set forth in said resolution.

As this is written, the commission has not decided upon the exact method which will be followed in the conduct of this investigation. Usually such work is assigned to the economic branch of the commission, but occasionally investigations are assigned to a member of the commission who takes immediate charge and keeps in constant touch with the progress of the work. It is not improbable that this procedure will be followed in this case.

J. T. Newcomb, counsel of the Joint Committee of National Utility Associations, in charge of its Washington office, made a formal appearance before the commission on Feb. 20. He called the attention of the commission to the fact that one of the principal purposes of the joint committee is to make available officially to the government information, studies, engineering data, operating experience or other data relating to the utilities which may be useful to any government agency. He stated that he had been instructed formally to tender the services of the joint committee in connection with this inquiry. He assured the commissioners that the committee will do all in its power to assist in making the investigation a thorough one.

Secretary Tydings of Maryland, one of those who voted to intrust the public utility investigation to the Federal Trade Commission, has served notice by letter to Chairman Humphrey that if the commission fails to make a "complete, searching, fair and non-political probe," he will introduce a bill to abolish it as a "useless million-dollar-a-year expense" to the taxpayer.

### Norris Bill Unfinished Business

The Senate on Feb. 20 made the Norris Muscle Shoals resolution the unfinished business before that body. This probably indicates an early vote on the proposal to lease the power developed at the Wilson Dam and to use the proceeds for the experimental production of fertilizer. Objection to the Norris resolution is entertained by some members of the Senate on the ground that it opens the way for the entry of the government into the electric power and fertilizer businesses.

Senator Sackett of Kentucky has offered a substitute resolution which provides more specifically for the promotion of the use of concentrated fertilizers on the nation's farms. His resolution also carries the item to which objection is made, authorizing the Secretary of War to construct transmission lines. The Sackett substitute eliminates the government operation feature of the power plants, but makes no provision for the equitable distribution of the power. After the energy is developed the Norris bill provides for its equitable distribution. The Sackett substitute provides for a fifteen-year lease as compared with the ten-year maximum in the Norris proposal.

Another substitute for the Norris proposal has been introduced by Senator Tyson of Tennessee. He proposes to lease the power generating properties for a period of twenty-five years, but in the event that the Secretary of War is unable to secure a satisfactory lease within a reasonable time, he is required to operate the power plant and contract for the sale of power. Upon reasonable notice, however, the lease may be canceled after the expiration of ten years. Both the Tyson and Sackett proposals provide for the encouragement of the use of concentrated fertilizers.

Consideration of Boulder Dam legislation is proceeding in executive session before the irrigation and reclamation committee of the Senate. The bill is now being read for amendments and progress is reported to be slow. There has been no change in the position of the House committee.

---

## Chicago Company Adopts Optional Room Rate

*Commonwealth Edison Figures that a Substantial Saving to 91½ per Cent of Its Residential Customers will Result from Change*

ON FEB. 15 the Commonwealth Edison Company of Chicago filed with the Illinois Commerce Commission a new tariff of residential rates which the company figures will save customers $1,300,000 a year on the basis of consumption in 1927. The new schedule, which is to be optional and is based on counted rooms, will apply to meter readings taken on and after April 1. It will impose a charge of 7 cents per kilowatt-hour for the first 3 kw.-hr. per room per month, 5 cents for the next 3 kw.-hr. per room per month and 3 cents for energy in excess of 6 kw.-hr. per room per month. The present rate is 8 cents per kilowatt-hour for the first 30 hours' use per month of the maximum demand, 5 cents for the next 30 kw.-hr. and 3 cents for any excess over 60 hours' use.

Since 91½ per cent of all residential users of electricity in Chicago live in homes of from three to seven rooms, the monthly bills of that percentage will, the company estimates, be reduced, assuming the same amount of use; but any dissatisfied customer will be at liberty to revert to the former schedule. The last previous reduction in Commonwealth Edison rates—the thirteenth—was in August, 1923. In 1927 the average residential electric bill was $2.29 a month, and the average rate paid by residential customers for electric service was, the company says, 5½ cents per kilowatt-hour.

# Economic Aspects of Power Production

## Midwest Power Conference Combines Engineering and Commercial Consideration of Generation and Utilization—President Glenn Frank's Prophecy

BROADER economic aspects of the relation between the production and utilization of power by industry and business held the stage at the third annual Midwest Power Conference, on Feb. 14 to 18, at the Hotel Stevens, Chicago, where nearly one thousand utility and industrial engineers and executives assembled.

Speaking at the opening session, Dr. Glenn Frank, president of the University of Wisconsin, portrayed the part that power promises to play in the future of our civilization. He pointed out that a machine civilization in which power can be taken to the worker is radically different from a machine civilization in which the worker must go to the power. Among several other important things, it means that even the mass production of goods and machines can be carried on in a decentralized industry, whereas a civilization in which the worker must go to the power means that mass production cannot be carried on save in a centralized industry. Once the cheap transmission of power decentralizes industry as it is now doing, most of the ugly social problems created by industrial centralization in congested cities will disappear automatically.

In his opening address Major Rufus W. Putnam, chairman of the conference, predicted that Illinois, Indiana, Wisconsin and Michigan will add eight million to their present population of seventeen million in another thirty years. He outlined the effect of increased population and industrial activity upon the use of power and pointed to the major transmission systems of the utility companies in the Great Lakes region which are being extended to meet these requirements.

Power's accomplishment in the factory and home was the topic of discussion at Tuesday afternoon's general session, when W. A. Durgin, director public relations Commonwealth Edison Company, gave an illustrated address.

Picturing electricity as the great burden bearer of mankind, R. Burke Corcoran, manager of the Electric Association, Chicago, pointed to the fact that $930,000,000 has been invested by the public of Chicago in electric wiring, appliances and equipment to promote human comfort, convenience and happiness.

On Wednesday the conference was given over largely to discussion of power problems, their relation to flood control and development of national and international waterways. Construction of reservoirs as a means of flood control was declared by two speakers to be in most cases economically unsound and physically inadequate. These speakers were General Edgar Jadwin, chief of engineers, U. S. A., and Daniel W. Mead, Madison, Wis., who analyzed in detail the work accomplished by such projects in Minnesota and Wisconsin.

Irrigation, flood control and possibilities of power development on the Colorado River were discussed by Colonel William Kelly, Buffalo, who compared the proposed Boulder Dam project with what he considered less costly and equally satisfactory methods of accomplishing the same end. Major G. E. Edgerton, chief engineer of the Federal Power Commission, said that while, on the whole, the present status of hydro-electric development is, perhaps, satisfactory, it can scarcely be described as gratifying. Navigation and projected power development on the St. Lawrence River were discussed by E. A. Forward, consulting engineer, Montreal.

H. A. Hageman, chief hydraulic engineer with Stone & Webster, Boston, described increased efficiency in hydraulic power equipment.

At the annual banquet on Wednesday evening Rufus C. Dawes spoke on "Engineering Phases of International Finance," with particular reference to international credits.

### Economics of Power Stations

Alex Dow, president Detroit Edison Company, speaking in his characteristic style on capital costs with relation to economy of central stations, urged upon engineers that in the design of power plants there be a careful balance of efficiency against total cost. Mr. Dow pointed out that in striving for high thermal efficiencies sight is sometimes lost of the fact that the cost of obtaining the last few per cent of increased efficiency may far outweigh the benefits derived.

Discussing operating experience with high-pressure and high-temperature steam, George A. Orrok, New York Edison Company, described a number of high-pressure installations in operation. Experience showed no serious difficulties in the way of operating plants up to pressures of at least 2,000 lb. per square inch and that the operation of superheaters raising steam temperatures to 850 deg. F. with ordinary steel superheater tubes was commercially practicable, but the most economical pressure and temperature for any given case have yet to be determined.

"Trend and Development in Steam Generation" was discussed in a paper by Thomas E. Murray, New York. Large installations and operation at higher production rates are the order of the day, he said, and it is now possible to obtain boiler production rates of more than 1,000 per cent in continuous operation. At present plans are being made for boilers having a capacity of 800,000 lb. of steam per hour, and this may be increased to 1,000,000 lb.

Methods and developments in power transmission were topics of discussion at a luncheon symposium on Thursday, at which H. W. Eales, H. M. Byllesby & Company, stressed the precautions which utility companies are taking to insure reliability of electric service to industrial plants and the communities supplied by the power companies' overhead transmission lines. Power transmission by high-voltage cables, methods of supplying power to industrial plants by cable circuits and use of ring circuits were discussed by H. B. Gear, Commonwealth Edison Company. Developments in power-transmission systems were outlined by A. C. Montieth, Westinghouse Electric & Manufacturing Company, and some of the causes of failures in impregnated insulated lead-sheathed cables were analyzed by W. S. Clark, General Electric.

Fuel and combustion economies of power stations were the topics of Friday morning's sesions, at which papers were presented by T. A. Peebles, Hagan Corporation, Pittsburgh; J. F. Shadgen, Smoot Engineering Company, New York; Edward Brown, Allis-Chalmers Company, Milwaukee, and Dr. S. W. Parr and F. C. Straub, University of Illinois.

Speaking on "The Engineer's Part in Business" at a luncheon meeting of the American Society of Mechanical Engineers on Friday, W. S. Hovey, president Fairbanks, Morse & Company, emphasized the need for the commercially minded engineer.

Coincident with the conference, the third annual Chicago Power Show, with 275 leading manufacturers of power and electrical machinery exhibiting, was held at the Coliseum under the auspices of the Midwest Engineering and Power Exposition.

---

# Electric Heating Load and the Central Stations

At a meeting of the electric furnace section of the National Electrical Manufacturers' Association held in Detroit, Feb. 21, organization of the section was completed and plans were made looking to improvement of trade practices and more intensive development of the market. In discussing the extent of available business it was contended that the central-station companies, the principal beneficiaries from having the electric heating load connected to their lines, have so far failed to put forth the amount of engineering and sales effort that the value of this class of business seems to warrant. In order to present a better and more complete picture of the amount of electric heating load that is being added and as a guide to the extent of the business the furnace manufacturers have agreed to collect statistics giving the number of furnaces, total kilowatts and value in dollars of sales in units up to 100 kw. and of 100 kw. and over. This information is to be collected and published monthly.

# Harvard Medal Awarded to J. H. McGraw

## Publisher of "Electrical World" Honored for His Distinguished Services to Advertising—He Discusses the Part of Advertising in Building American Industry

TO JAMES H. McGRAW, president of the McGraw-Hill Publishing Company, last week was awarded the gold medal "for distinguished contemporary service to advertising," given under the Harvard Advertising Award, "because of his lifelong service in the upbuilding of higher standards in advertising in the business press of the country and his pioneering work in the recognition of advertising relations to marketing." The presentation was made at a dinner on Friday night in Boston under the auspices of the Graduate School of Business Administration of Harvard University. This is one of the four awards established by Edward Bok as an expression of the conviction that advertising, wisely utilized, is a great economic power to broaden markets and decrease the cost of distributing goods, but, if unscientifically employed, is wasteful to the community. Mr. McGraw is the third person to be honored with this medal.

In accepting the medal Mr. McGraw discussed some of the broader aspects of the part which advertising is playing in the development of American industry and the maintenance of prosperity, with particular reference to present business conditions. He said in part:

"At present the volume of trade is large. But competition is throttling and profits in some quarters are declining. Some industries are despairing of customers. Has advertising, now so generally used, proved ineffective in maintaining full prosperity? Advertising has won its spurs in the economical movement of distinctive goods, with resultant public gain. Is it not the greater field of staples or 'near staples' to which advertising must now be more widely applied, both in the industrial and consumer fields? And may not we here find a tonic for the price competition malady, thus aiding to restore complete industrial health?

"In considering the broader as well as the more effective use of advertising, it may well be questioned whether any product, however staple at first sight it may appear, is without elements of distinction. A product is endowed with the qualities of its makers, and no organization is entirely devoid of personality. The very fact of survival in a competitive market is proof that there is distinctiveness in product or service. There are a hundred respects in which firms differ from each other. All these affect the willingness of the buyer to take one manufacturer's product rather than another's, even though the products appear to be similar. We must increase our knowledge of how to sense these elements of distinctiveness in this great field of the staple product. Then we shall open up new vistas of advertising effort. Then we shall transfer many products from the miasma of excessive price competition to the high free air of competition in quality and service. Then we shall trade up, rather than down. And business will be the healthier for it.

"It is apparent that the very planning of advertising causes a most searching examination of products, to determine the distinctive elements. If, perchance, there be no market distinction, then, at the very least, advertising may guarantee a continuance of quality. The market position of certain brands of flour, bread, soap, cement, brass, industrial belting—the prosperity attending their makers—is eloquent testimony of advertising's effectiveness in the staple field. It has endowed run-of-product with a special character, and, through the guarantee of sustained quality, advertising has made specialties within staples.

JAMES H. McGRAW

"True, advertising does not confer full immunity from price considerations and consequent narrow profits and halting markets, but it does shift the competition to bases of quality and use. It puts the battle on the seller's rather than the buyer's ground, but at the same time it proves a boon to the buyer because of insistence on quality. The slogan 'Quality is remembered long after price is forgotten,' already accepted as a principle by industrial consumers, suggests distinct social advantages to consumers at large. Why, then, has not advertising been more completely adopted by business? Why is there today some mistrust of advertising and often lack of will to invoke its power to help correct the current business situation?

"Advertising failures have resulted less from lapses in advertising technique than from advertising misapplied. Advertising cannot create qualities. Advertising cannot give market standing to a product where market value does not exist. It is sheer folly to assume that a product will take on compelling qualities if only they be claimed in advertising. Advertising can express, develop and amplify what is already present. It can stimulate the seed of product or service personality to growth and vigor. It cannot create the seed. Advertising is a challenge to soundness. It drags an institution into the limelight. It exposes it to examination and to criticism of its claims. For businesses with productions that match the needs of the times advertising is a beneficent instrument; for those with products that have no rightful market claim advertising is either corrective or fatal. And to soundness of product or service there must be added soundness of marketing method, if advertising is to be an effective instrument of prosperity.

"Distribution costs are being subpœnaed before the court of public opinion, and too often advertising has had to bear the unjust odium of marketing's shortcomings. The logical markets may have been wrongly appraised. Distribution was attempted under conditions that made the cost prohibitive. Difference in buying habits, according to fields or industries, has been overlooked. Appeals to buyers have not been valid. Distribution channels have not been effectively organized. The sales force has been inadequate, ineffective or mishandled. Yet of advertising is expected the impossible delivery of economical distribution. It is to the credit of many advertising men that they have been among the leaders in the adoption of modern marketing methods and that, in large number, they are competent counselors on marketing plans.

"We can look with great hope on advertising's promise for the maintenance of prosperity. Advertising has an important rôle in widening the profit margin in both industrial and consumer transactions. It removes products from unhealthy price competition as fast as it can unearth distinctiveness in products and organizations. It reduces production costs by insistence, in the planning of campaigns, on conformity of goods to needs and on standardization and simplification. It reduces distribution costs by challenging unsound marketing programs. Proved to be an effective instrument in marketing specialties, advertising is now entering the even larger arena where staples are battling before a price-obsessed public. It offers new weapons of quality and service in business' struggle with meager profits. Proved the stimulant of new public wants, advertising holds out enticing incentive to ever-faster introduction of new products."

## Federal Court Restrains the Cambridge Rate Order

Judge Lowell of the United States District Court issued a restraining order on Monday of this week against the Massachusetts Department of Public Utilities in regard to enforcing its recent decision reducing the maximum price per kilowatt-hour from 8 cents to 5½ cents on the system of the Cambridge Electric Light Company. The company has filed a petition for a temporary injunction which will be before the court for hearing in about a week. Press reports current in Boston last week to the effect that the company had decided to accept the commission's finding were denied as without foundation by Frank H. Golding, general manager of the New England Gas & Electric Association, upon inquiry by the ELECTRICAL WORLD as to their authenticity.

## Governor Smith's Water-Power Bill Again Up

Governor Smith's bill to set up a Water Power Authority in New York State to "conserve and control" its water-power resources and provide for the submission of a comprehensive plan to the Legislature was once more introduced at Albany last week. Senator Downing called for a "popular uprising" to bring about passage of the bill and the Governor will probably write a special message in its support. There seems, however, little doubt that, as before, the bill will get nowhere against a hostile legislative body.

## Consumers Power-Detroit Edison Interconnection a Fact

On Thursday of this week throwing a switch at Jackson, Mich., tied in the high-tension systems of the Consumers Power Company and the Detroit Edison Company. The interconnecting link, work on which was begun a year ago, will operate at 132 kv. From a new substation of the Detroit Edison Company near Ypsilanti, which contains three 15,000-kva. transformers, a steel-tower transmission line carrying a three-phase copper circuit runs 42 miles to a joint substation at Cement City, south of Jackson. A like transmission line, 18 miles long, runs from a new Consumers Power substation north of Jackson, containing three 10,000-kva. transformers, to the joint station at Cement City. It is proposed later on to add a second circuit of like capacity.

The Consumers Power Company, which serves central, western and some eastern counties in Michigan, has a total rated capacity of about 283,000 kw. The Detroit Edison Company has about 644,000 kw. in the industrial southeastern section of the state. The interconnection will enable either company to call on the other to the extent of 37,500 kw. No formal ceremony took place on Thursday, but Alfred C. Marshall, vice-president and general manager of the Detroit Edison Company, and Charles W. Tippy, vice-president and general manager of the Consumers Power Company, met at noon at the substation north of Jackson and joined in the throwing of the switch.

## Maryland Commission's Ban on Sale Upset

Remanding to the Public Service Commission of Maryland for further procedure the application of the Electric Public Utilities Company for permission to purchase four small power plants in the western part of that state, the Court of Appeals declared last week that it was not within the discretion of the commission to refuse such permission unless it was proved that the change in ownership would be detrimental to the public interest. This decree upset the decision of the Baltimore City Circuit Court (see ELECTRICAL WORLD for July 23, 1927, page 182). In remanding the application the court expressed no opinion as to its merits.

The small companies concerned are the Home Electric Company of Lonaconing, the Emmitsburg Electric Company, the Antietam Electric Light & Power Company and the Midland Electric Light Company.

## Key in Fort Myers Starts Up Lights in Bellingham

Completing what is probably the longest remote-control circuit ever attempted in the United States, Thomas A. Edison, at Fort Myers, Fla., on the evening of Feb. 11, his eighty-first birthday, closed a key which actuated the switch controlling the new lighting system for the business district of Bellingham, Wash. This circuit, extending from Fort Myers to Bellingham via Washington, New York, Buffalo, Detroit, Chicago, Fargo, Butte, Spokane and Seattle, measured approximately 5,700 miles and had been set aside for the occasion by the Western Union Telegraph Company along with a second standby circuit following a different route.

## Iowa Power Conference Hears of Gain in Rural Service

A continued tendency toward consolidation, a higher standard of construction for transmission lines and an encouraging attitude by the industry toward solution of rural electrification problems were outstanding features last year in the light and power industry in Iowa, according to Joe Carmichael, director of the Iowa Committee on Public Utility Information, who spoke at the second annual power conference last week at the University of Iowa, Iowa City, at which a hundred engineers and power experts gathered.

Utilization of Iowa coal in industrial power development was discussed by J. E. Everson, general superintendent of the Sioux City Gas & Electric Company. "Pulverized-coal firing puts Iowa coal, admittedly of a lower quality, on a par with any coal so far as physical results are concerned," he said.

Sidney L. Miller of the Iowa College of Commerce dwelt on the social benefit to be derived from the development of electricity because of its decentralizing influence on industry.

## Purchases and Mergers

*Portland Electric Power Plans to Buy Northwestern Electric — Holding Company Formed in Providence to Buy Utilities*

ANNOUNCEMENT was made on Feb. 18 by Franklin T. Griffith, president of the Portland Electric Power Company, and Guy W. Talbot, president of the Northwestern Electric Company, that the Portland Electric Power Company would purchase the competing Northwestern company and make a material rate reduction, provided that the deal is sanctioned by the people of Portland at a special election which will be held in April at the expense of the two power companies. Operating economies estimated at approximately $300,000 a year resulting from the consolidation will be passed on in their entirety directly to the customers in the form of reduced rates applicable first to the domestic customer and secondly to the other classes of business.

The franchise of the Northwestern Electric Company, which expires in 1937, contains a clause prohibiting the sale of the property to a competing company without the consent of the City Council. The companies have suggested that the Council submit to the voters an ordinance permitting the consolidation. Promised domestic rate reductions will be made public before the people are asked to vote on the merger. The Northwestern Electric Company, purchased by the American Power & Light Company from the Fleischhacker interests in 1926, is valued at $23,000,000, and E. W. Clark & Company of Philadelphia now hold the controlling interest in the Portland Electric Power Company property, valued at $81,000,000. The joint properties have a combined steam and hydro generating capacity of 232,000 hp. and approximately a hundred and forty thousand customers.

The recent formation of a four-million-dollar holding company, the New England Water, Light & Power Company, to acquire public utility properties in different parts of New England, was announced last week at Providence by Arthur B. Lisle, former vice-president and general manager of the Narragansett Electric Lighting Company, who is heading the new firm, which will have headquarters in the Rhode Island capital. The companies so far acquired are mainly water companies, but the Central Connecticut Power & Light Company, East Hampton, Conn., is included.

Proposed operation of the Charlemont (Mass.) Electric Light & Power Company as a municipal plant by the town of Charlemont was defeated by a vote of 70 to 55 at the annual town meeting recently.

The Foshay interests in Vermont are to take over the Nichols company, operating in Barton.

The Low Power & Light Corporation has made application to the New York Public Service Commission to lease to the village of Tupper Lake the power plants in Colton and Piercefield, and the village of Tupper Lake has asked for authority to do a general business in Colton, Piercefield and Altamont.

Public hearings on the application of the Potomac-Edison Power Company to absorb four smaller companies in western Maryland were to be held Feb. 24 by the Maryland Public Service Commission. Little opposition was expected, if any. The four companies to be absorbed are the Ridgeley Light & Power Company, the Piedmont Electric Light & Power Company, the Potomac Light & Power Company and the Clearspring Electric Light & Power Company.

Cortland, Ohio, plans to sell its municipal lighting system to the Ohio Public Service Company, and preliminary legislation has been passed by the Council.

Authority has been granted by the Illinois Commerce Commission to the Illinois Power & Light Corporation to purchase the Orvil Light, Power & Water Company at Hartsburg for $26,150. The commission denied permission to purchase the Arenzville Light & Power Company, Prather & Hill Electric Company and Elkhart Electric Light Company.

The Illinois Power & Light Corporation has applied to the Illinois Commerce Commission for authority to acquire the Secor Light & Power Company.

Petition to purchase the Dillsboro (Ind.) Electric Company for $23,500 has been filed with the Indiana Public Service Commission by the Interstate Public Service Company.

The City Council of Onida, S. D., has called a special election for Feb. 28 to vote upon selling the municipal lighting plant to the Northern Power & Light Company, of Mobridge, S. D., for $22,600.

In answer to the Northern States Power Company, which wished to buy the city-owned electric plant at Moorhead, Minn., the Council says the system is not for sale.

The Minnesota Hydro-Electric Company, operating in the northern part of Minnesota, has been sold to the Northwestern Utilities Company of Minneapolis. The purchased company has been combined with four others owned by the Northwestern Utilities in Minnesota and Wisconsin.

The Northern States Power Company is negotiating with the Lakefield (Minn.) Town Council for purchase of its municipal electric plant.

Because officials of the city of Stafford, Kan., fear that rates of the municipally owned electric plant would have to be raised if a sister city, Sylvia, sells its distribution system to the United Power & Light Corporation, Stafford has entered objections with the State Public Service Commission. It is understood that the company desires to acquire the right to serve both towns.

Negotiations have been completed by the Central Kansas Power Company, with headquarters at Hays, for the purchase of the municipal electric light and power plant at Atwood, Kan., it is announced by Ross Beach, manager of the power company.

College View, Neb., a suburb of Lincoln, has defeated a proposal to sell its light and power plant to the Iowa-Nebraska Light & Power Company. The vote was 513 to 366.

The Western Light & Power Company of Salina, Kan., is reported to have offered $200,000 for the municipal lighting plant of Caldwell, in that state.

The Oklahoma Power & Water Company, newly incorporated in Delaware, has received authority from the Corporation Commission of Oklahoma to take over the Sand Springs Light & Power Company, the Sand Springs Home (supplying electricity), the Bigheart Light & Power Company, the Cimarron Light & Power Company and the Eastern Oklahoma Light & Power Company. Cities affected by the change are Sand Springs, Sperry, Skiatook and seventeen others.

Permission to merge the Kansas City Power Securities Corporation with the Continental Gas & Electric Company is being sought from the Missouri Public Service Commission. The Power Securities Company is the local holding company for the Kansas City Power & Light Company. The Continental Gas & Electric owns the common stock of the Power Securities.

Application has been filed with the Missouri Public Service Commission by the National Utilities Company, with headquarters at Brookfield, Mo., for authorization to purchase the Kirksville Gas, Heating & Electric Company and the Brookfield Gas, Electric & Heating Company.

Sale of the Rockport (Mo.) Light & Power Company by W. F. Marshall and O. W. Clifton to a new corporation to bear the same name has been authorized.

Purchase of the electric distribution system of Chula, Mo., by the Missouri Public Service Company is announced.

Sale of the city light plant at Benton, Ark., to the Couch interests will probably be an issue in the April city election.

The Arkansas Power & Light Company has purchased the lighting plant of Yellville, Ark., supplying power and light to Yellville and Summit.

Announcement is made by the Oklahoma Gas & Electric Company that the city of Drummond has voted to sell its municipally operated distribution system to that company.

The Carolina Power & Light Company, Raleigh, N. C., has bought the South Carolina Power & Light Company, serving Kingstree, Manning, Lake City and other places in South Carolina.

The East Coast Utilities Corporation, owned by Chicago interests, has in recent months acquired small plants in Waverly, Irvington, Kilmarnock, White Stone, Colonial Beach and other towns in eastern Virginia. The company is building a small generating plant at Port Richmond, near West Point, to furnish light and power to West Point, Saluda, Urbanna and other points in that section.

The Stuart (Va.) Light & Power Company has been sold to J. F. Reynolds and J. F. Reynolds, Jr.

A movement is on foot to sell the municipal electric light plant at Athens, Ala., to the Alabama Power Company.

Reports are current in Austin, Tex., that that city is considering the sale of its light and power plant to the Texas-Louisiana Power Company of Fort Worth.

A resolution for the sale of the municipal lighting plant to the Florida Public Service Company for $82,000 has passed the Mount Dora (Fla.) City Council.

A unification agreement has been signed by the Capital Traction Company, the Washington Railway & Electric Company and Harley P. Wilson, the owner of 21,237 shares of the stock of the Washington Rapid Transit Company, by which a new company, to be known as the Capital Transit Company, will be formed to operate the street railways and bus lines which the three companies are now operating in the District of Columbia and nearby regions. The plan must be approved by the Public Service Commission and by Congress. The street-railway business of the Washington Railway & Electric Company will be taken over, but the power business of the company will be continued as a separate entity, with the agreement that power is to be furnished the new company at reasonable rates.

Seeking to relieve the complications of the corporate set-up of its subsidiaries, the Consolidated Gas, Electric Light & Power Company of Baltimore has just filed with the Maryland Public Service Commission an application to acquire the properties and assets of the concerns in entirety. These subsidiaries are twelve in number. They include the Mount Washington Electric Light & Power Company and the Patapsco Electric & Manufacturing Company of Delaware.

Announcement has been made of the acquisition by the Canadian Hydro-Electric Corporation, a subsidiary of the International Paper Company, of the properties and assets of the Ottawa & Hull Power Company and its subsidiary, the Ottawa River Power Company, which serve the cities of Ottawa and Hull. This means that almost entire control has been obtained by the International Paper interests of all power developments in the Ottawa and Gatineau districts. The Power Corporation of Canada held the majority of the shares of the Ottawa & Hull Power Company.

## Kinston, N. C., and Municipal Ownership in That State

As previously reported, several bids for the Kinston (N. C.) municipal plant of approximately three times its cost have put that community of 12,000 souls on the electrical map and aroused intense interest among its inhabitants. (Electrical World, Feb. 18, page 370.) The matter will furnish the chief issue in the next municipal election. Backers of the proposal accepted by the City Council to sell the plant to the Carolina Gas & Electric Company for $1,271,000 will have to fight to bring a majority of the voters to their viewpoint. There is strong opposition, despite the fact that Robert A. Blackwood, head of the company, lives at Kinston and that the company has its headquarters there. One element of the voters believes that the still higher Gregory-Livingston bid should have been accepted. Another element opposes a sale to any group. Still others would have new bids called for or have the property turned over to the Carolina Power & Light Company. Though the Carolina's offer was considerably lower than the others, that company had a large following which believed it would "do more for Kinston" than either of the others.

City officials at Greenville, Washington, New Bern and other towns in the eastern half of the state that have municipal plants are watching the Kinston situation, and the outcome will be influential in strengthening or weakening the opposition that has been manifested in North Carolina towns to disposing of their plants to private companies.

# Oppose Plan of Regulation by Contract

*Massachusetts Utility Companies Assail Commission Bill Now Before Legislative Committee — Professor Cabot Defends Reproduction Cost as Rate Base*

A BATTLE royal between the Massachusetts Department of Public Utilities and the light and power companies represented in the Massachusetts Gas and Electric Association began last week at Boston over the regulating commission's bill providing for legislation under which companies would be penalized by non-consent to regulation by agreement along the lines reviewed in the ELECTRICAL WORLD for Dec. 17 (page 1265). At the opening of an all-day hearing before the legislative committee on power and light, Chairman H. C. Attwill of the Massachusetts commission set forth the board's bill as an opportunity for electric and gas companies to readjust their capital and carry on their future business under a regulative contract with the state which would safeguard their securities and insure protection of consumers against exploitation either by local managements or by outside controlling groups. He excoriated the policy of resisting rate reductions ordered by the commission, as in the case of the Worcester Electric Light Company, and declared that unless regulation of privately managed utilities is assured, municipal ownership will follow.

For the power companies, Sheldon E. Wardwell took the ground that the bill of the commission is revolutionary in character, threatening the stability of the industry by its new and untried expedients and by its requirement that companies accepting it abandon their right of appeal to the courts. He maintained that it would virtually wipe out the surpluses of many companies and cut down their proper rate bases, drying up the wells of fresh capital supply and stultifying the industry's development. The agreement proposes to furnish a fair return to the investor on his "desiccated" investment, but the future investor will not accept a risk where there is no constitutional protection. The promise to keep the stocks at par is ephemeral, the speaker declared, and in times of economic stress the financial burden would be transferred wholly from the investor to the rate payer.

Prof. Philip Cabot, head of the public utility courses of the Harvard Graduate School of Business Administration, analyzed the commission's bill from the economic standpoint and maintained that its objective—obtaining a necessary service for consumers at the lowest possible price — cannot be attained through this agency. He reasoned that the application of the bill would tend to create inflation in the long run, followed by increased rates at times when decreases are in order and increased severity of the business cycle. The rigid rate base chained to the dollar he held to be artificial and very dangerous.

Vigorous opposition to the bill was voiced at a second hearing by B. Loring Young on behalf of the Associated Industries of Massachusetts; F. W. Denis, vice-president Old Colony Trust Company, Boston; H. P. Gifford, president Savings Bank Association of Massachusetts and of the National Association of Mutual Savings Banks; Fitzhewey Smith, Massachusetts Bankers' Association, and Arthur W. Wood, investment banker, Boston.

Mr. Young contended that the business interests of the state are gravely concerned lest the bill impair the ability of the power companies to meet the expanding demands of industry for power. Other points made against the bill were its alleged unconstitutionality, the difficulty of maintaining stocks at or near par by commission action, the premium put on extravagance of management, liability of higher rates, and lack of provision for an emergency requiring drastic remedies. Chairman Attwill and Commissioner Wells defended the bill, urging that its opponents misinterpret its intent and exaggerate its effect on the stability of regulative practice in Massachusetts. The hearing was adjourned until this week for further rebuttals to be presented.

---

# Two Recently Built Canadian Automatic Hydro Stations

STEADY increase in demand upon the Georgian Bay System of the Hydro-Electric Power Commission of Ontario has led to the recent completion of an automatic plant at Hanna Chute on the Muskoka River. This station, which is in a district lying north of the territory served from Niagara Falls, is operated by remote control from the South Falls generating station, half a mile below. The Hanna Chute station, built in a narrow rock gorge, is of pressed-brick construction and houses one vertical-type, three-phase, 60-cycle, 6,600-volt generator with a rated capacity of 1,400 kva. at 80 per cent power factor, operating at 225 r.p.m. The lubrication system is self-contained. No step-up transformers are provided at this plant, the station feeding direct to the South Falls station.

The exterior of the Alouette power plant of the British Columbia Electric Railway Company, shown on the right, has recently been finished. It is built on Stave Lake, 12 miles above the present Stave Lake plant, from which it will be automatically operated. Rated at 10,000 kva., the Alouette plant, which cost $2,300,000, will add almost 13,000 hp. to the present capacity of the company, and is therefore among the largest of its description. The Alouette chain of lakes lies at an elevation of 370 ft. above sea level, 25 miles east of Vancouver. They have a drainage area of 80 square miles with a dependable flow for power purposes of 700 cu.ft. per second, which is 90.2 per cent of the mean flow.

The development consisted of raising the lakes approximately 50 ft. by means of a semi-hydraulic earth-filled dam with separate concrete-lined spillway and an overflow weir and control crest gates set in the spillway at the north end of the dam. At the upstream end of the lake, which is 10 miles away from the dam, a 12-ft. by 16-ft. tunnel has been driven through the narrow ridge to Stave Lake, a distance of 3,500 ft. The water is discharged through this tunnel to the power plant at an average head of 132 ft., the flow and generation of 12,500 hp. being controlled at Stave Lake power plant.

## National Speakers Engaged for Tulsa Convention

The program of the tenth annual convention of the Oklahoma Utilities Association, to be held at Tulsa, March 13 to 15, will contain many national convention features, according to E. F. McKay, manager of the association. Among its features will be an illustrated review of the outstanding developments in electricity in 1927 by John D. Liston, General Electric Company; a discussion of relations between the newspapers and the utilities of Oklahoma by N. A. Nichols, secretary Oklahoma Editorial Association; a review of the year and a forecast of the future in public relations by J. F. Owens, vice-president Oklahoma Gas & Electric Company; an address on interstate phases of electric power development by H. S. Bennion, director of engineering, N.E.L.A., and a statement of progress toward elimination of drudgery in the home by Miss Eloise Davison of the headquarters N.E.L.A. staff. Representative Charles A. Eaton will speak at the banquet.

The Electrical Division program, March 13 and 14, will include: "Developing Power Load in the Oil Fields," O. A. Jennings, Oklahoma Gas & Electric Company; "Rural Electrification," Edwin Kurtz, chairman Oklahoma Farm Electrification Committee; "Refrigeration," R. W. Curran, Bartlesville Gas & Electric Company; "Rural-Line Construction Standards," L. H. Reagan, Southwestern Light & Power Company; "Developing the Small Industrial Load," S. I. McElhoes, Southwestern Light & Power Company; "Safety Methods and Accident Prevention," C. H. Meyer, Public Service Company of Oklahoma, and "Developments in Commercial Lighting," A. E. Warner, Oklahoma Gas & Electric Company.

## Applications Before Federal Power Commission

G. S. Howe of East Radford, Va., has applied to the Federal Power Commission for a preliminary permit covering a 12,000-hp. project on New River near East Radford. It is proposed to construct a dam 50 ft. high in New River which will create a reservoir extending up stream to Plum Creek, a distance of 12 miles.

The Board of Directors of State Institutions of Arizona has applied for a preliminary permit for a project on the Colorado River, the site being at Grand Wash Canyon, Mohave County. The project involves the regulation and storage of water for irrigation and power, which will be used for public utility purposes.

Anita M. Baldwin of Los Angeles has applied for a license to cover the replacing of a timber dam at an existing project on Taylor Creek in El Dorado County, Calif., with a concrete structure. The new dam is to be 10 ft. high and 450 ft. long. Only 150 hp. is involved.

# Briefer News

Progress on Oswego River Plant.—Nearly all construction work on the power plant of the Oswego River Power Corporation, at Dam 6 in the Oswego River, in New York State, is finished. Waterwheels have been set and electrical equipment is now being installed. The plant will go into operation early in the spring, it is thought.

Springfield (Mass.) Company Cuts Rates.—Directors of the United Electric Light Company, Springfield, Mass., last week voted to reduce rates from 7 cents to 6 cents a kilowatt-hour for domestic consumers using less than 200 hours a month and to 5 cents if more than 200 kw.-hr. is used. For refrigerators and ranges on a separate meter 4 cents will be the rate.

German Cloud-Advertising Machine Demonstrated. — An imported machine from the shops of Carl Zeiss, a German maker of photographic apparatus and lenses, is here shown on the roof of the Salmon Towers Building in New York. It is designed for casting advertisements on the clouds by means of a searchlamp shining through stenciled dies which rotate with a larger disk. The night must be cloudy to make the instrument of value, as the projected message must have a background to give it material form.

Los Angeles Gas & Electric Wants Ornamental Street-Lighting Business.—Making a determined effort to get a share of the rapidly increasing ornamental street-lighting business of Los Angeles, the Los Angeles Gas & Electric Corporation on Feb. 9 announced 25 per cent reduction in rates on electricity used for this purpose. The present rate, 4 cents a kilowatt-hour, will be cut to 3 cents, effective March 1. The company's engineers declare the new rate will allow an 8 per cent return on investment.

Cincinnati in Quandary Over Lighting Its New Boulevard.—Cincinnati is confronted with the probability that its new Central Parkway will be unlighted throughout the spring and summer. This has just been revealed by the definite announcement of the Rapid Transit Commission of the municipality that it was not authorized to do more than to construct the parkway. The commission has bought and installed light standards and traffic signals, but has no legal authority to contract for energy and maintenance. The parkway is the city's most important boulevard.

Virginia Electric & Power Takes Load of Marine Corps Post.—Quantico, Va., and the United States Marine Corps post there have been placed on the main transmission system of the Virginia Electric & Power Company, according to William E. Wood, president. The company has completed a 27-mile extension of its 66-kv. line from Fredericksburg to Quantico and the construction of a modern all-steel substation at the Quantico terminus. The Marine Corps post previously has been served by its own power plant.

A.I.E.E. Regional Meeting Programs.—For the regional meeting to be held at Baltimore on April 17-19 three technical sessions are planned on the subjects of insulation, the Gould Street station of the Consolidated Gas, Electric Light & Power Company and the Conowingo development of the Philadelphia Electric Company respectively. The proper application of relays and the instruments and methods used in determining it will be topics at the New Haven regional meeting, scheduled for May 9-11.

Improvement Program for Michigan's Capital.—Of the large sum appriated for extensions to be made this year to the Consumers Power Company's system in Michigan, more than a million dollars will be spent on improvements in the Lansing district, according to Clark R. Graves, district manager. Service will be extended to Howell and towns en route; a substation will be erected in Delhi township, about 3 miles south of Lansing, and the completion of transmission lines connecting Lansing with Jackson, Battle Creek, Flint, Owosso and Ann Arbor will insure uninterrupted service.

Syndicate Power Company and West Texas Objectors Reach Agreement.—As a result of settlement of the controversy between the Insull interests and the West Texas Chamber of Commerce over the appropriation of water rights on the Colorado River, the Syndicate Power Company will immediately start its program for the construction of a series of dams and hydro-electric plants on that stream, according to reports said to emanate from the power company. The initial expenditure will be $1,000,000 and may be made before the end of this year in the purchase of equipment. An ultimate expenditure of $25,000,000 is envisaged. The Syndicate Power Company holds permits to build six dams and hydro-electric plants in the Colorado River, two in Travis County and four in Burnet County. Under the terms of the agreement the

Syndicate Power Company agrees to surrender all but 580,000 acre-feet of water annually of its legal rights to 1,225,000 acre-feet of the Colorado River, together with the waiver from south Texas rice growers to water above the proposed Hamilton dam in Burnet and Llano Counties.

Another Eel River Plant Projected in California.—The Snow Mountain Water & Power Corporation has obtained a permit from the California Department of Public Works to appropriate 400 sec.-ft. and 214,813 acre-ft. per annum from the South Eel River in Lake County for power purposes. The corporation plans to develop about 22,000 hp. at an estimated cost of $3,200,000, in addition to the output of its present power plant, which is supplied by water from the South Fork of the Eel River.

Rice Growers Benefit from Industrial Electrification in Arkansas.—Coming reduction in rates for electric service to rice growers is announced by Frank M. Wilkes, general manager of the Arkansas Power & Light Company. The new rates will, it is expected, save between 15 and 30 per cent, depending upon the rainfall and the amount of energy used during the pumping season. The reduction was made possible by the steady increase in the industrial power business of the company due to the establishment in Arkansas of additional mills and substitution of electric service for other power by long-established industries. Many additional rice farmers are planning to avail themselves of electricity in their homes as well as on their fields.

Rochester's Gain from Added Water Power.—Installation of a 23,000-hp. hydro-electric unit at Station 5 in the Rochester Gas & Electric Corporation's Genesee River power development at Rochester has enabled the company to generate an additional 16,000,000 kw.-hr. from the river flow and resulted in a saving of 16,000 tons of coal since October, according to Thomas H. Yawger, superintendent of the company's electric department. The new unit has enabled the company to take advantage of the flow which ordinarily would have gone over the dam during the last three and one-half months. Repairs completed last week on the break in the State Barge Canal near Holley also gave the utility company the advantage of added water power.

Pacific Gas & Electric Rate Reductions Will Save Consumers $1,600,000 a Year.—Through the voluntary reduction of electric lighting rates to domestic and commercial consumers served by the Pacific Gas & Electric Company a saving of $1,600,000 on their yearly bills will be effected, the company says. New schedules are now being prepared, and the reduced rates are expected to go into effect in March. They will apply to the cities and towns of all P. G. & E. territory except that recently acquired through purchase of the properties of the Western States Gas & Electric Company and the Coast Valleys Electric Company. Under the new plan the minimum charge of 90 cents will be abolished, and in its place there will be a 5-cent kilowatt-hour rate plus a small service charge. To the small consumer this will mean a saving of approximately 10 per cent. The Great Western Power Company is also to reduce its rates, a total saving of about $500,000 being the estimate.

Construction of Stevens Point-Green Bay Line Begun.—Preliminary survey work on the new 110-kv. tie-in line from the Bayside steam plant of Wisconsin Public Service Corporation to the Wisconsin Valley Electric Company's lines at Stevens Point has been completed and construction begun. The line will enable the cities in the Wisconsin valley to get the benefit of the lower prices of coal brought to the Green Bay docks via the Great Lakes and in turn will enable Green Bay and other eastern Wisconsin cities to profit by the use of power from the hydro plants in the Wisconsin valley in times of high water.

## *Coming Meetings*

[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for Jan. 7, page 80.]

New England Central Station Association of Power Engineers—Engineers' Club, Boston, Feb. 29. T. D. Bond, C. H. Tenney & Co., Boston.

American Institute of Electrical Engineers—St. Louis regional meeting, March 7-9; Baltimore regional meeting, April 17-19; New Haven regional meeting, May 9-11. F. L. Hutchinson, 33 West 39th St., New York.

Northwest Electric Light and Power Association — Engineering Section, Spokane, Wash., March 8 and 9. Berkeley Snow, 1208 Spalding Building, Portland, Ore.

Oklahoma Utilities Association—Mayo Hotel, Tulsa, March 13-15. E. F. McKay, 1020 Petroleum Bldg., Oklahoma City.

Illinois State Electric Association—Hotel Abraham Lincoln, March 14-15. R. V. Prather, 205 Illinois Mine Workers' Bldg., Springfield, Ill.

National Electrical Manufacturers' Association—Policies Division, Edgewater Beach Hotel, Chicago, March 14-16. S. N. Clarkson, 420 Lexington Ave., New York.

International Association of Electrical Inspectors—Madison, Wis., March 17-18. W. Wilke, 4211 Elring Place, Milwaukee.

Maryland Utilities Association—Emerson Hotel, Baltimore, March 23. G. S. Williams, 1005 Continental Bldg., Baltimore.

Southwestern Division, N.E.L.A. — Edgewater Gulf Hotel, Biloxi, Miss., April 3-5. S. J. Ballinger, San Antonio Public Service Company, San Antonio, Tex.

Nebraska Section, N. E. L. A.—Omaha, April 4 and 5. T. E. Browne, 1527 Sharpe Bldg., Lincoln.

Southeastern Division, N. E. L. A.—Miami, Fla., April 11-14. C. M. Kilian, 207 Bona Allen Bldg., Atlanta.

American Electrochemical Society Bridgeport, Conn., April 26-28. C. G. Fink, Columbia University, New York.

Missouri Association of Public Utilities—Jefferson City, April 26-28. F. D. Beardslee, 315 North Twelfth St., St. Louis.

Southwestern Public Service Association—Dallas, Tex., May 2-5. E. N. Willis, 403 Slaughter Bldg., Dallas.

Middle West Division, N.E.L.A.—Hotel Statler, St. Louis, May 9-11. T. A. Browne, 1519 O St., Lincoln, Neb.

First Rural Electric District Under New Nebraska Law Planned.—The directors of the Gering Valley (Neb.) Hydro-Electric Light and Power District have sold the $80,000 in bonds, subject to ratification by the voters on March 13, to a Denver house. The district, if established, will be the first under the new law intended to aid in rural electrification. It will serve sugar-beet growers owning 33,000 acres. The municipal plant at Gering, Wyo., which buys from the government reclamation dam at Guernsey, will supply the energy.

Canada May Set Up Electrical Testing Bureau.—The Dominion government is asking Parliament to sanction the creation of a Canadian Bureau of Standards, including the appointment of a director and the provision of facilities for the testing of electrical equipment and appliances of all kinds. Consent and co-operation of the provinces have already been obtained. Canadian and British manufacturers have made urgent representations to the government favoring such a bureau. Their products hitherto have been subject to the approval of United States laboratories in order to satisfy the fire underwriters.

For Improvement of New Orleans' Street Lighting.—Latest methods of street lighting in Chicago, New York, Detroit, Cleveland, Boston, Toledo, Milwaukee, Indianapolis, St. Louis and other Northern and Eastern cities have been studied by William T. Hall, commissioner of public utilities, New Orleans; Walter Dilzell, city electrician, and Frank Frost, general superintendent of the electric department, New Orleans Public Service, Inc. As the result of their tour Messrs. Hall and Dilzell will work out a new plan of street lighting for New Orleans. It is probable that this plan will include the installation of ornamental steel poles along Canal Street from the river to Claiborne Avenue, each pole carrying two 1,500-cp. lights with the poles 100 ft. apart. The present street-lighting contract will expire in April.

Tennessee Eastern Electric Seeks to Enjoin State Commission.—Involving issues of vital importance to the hydro-electric industry of the United States and to public utilities in general, the injunction suit of the Tennessee Eastern Electric Company against the Railroad and Public Utilities Commission of Tennessee has begun in the Chancery Court at Nashville. Flat denial of the legal right of the commission to exercise the power of control it claims over water-power development, or to impose a tax of one mill per kilowatt-hour produced, is made by the company, and even the authority of the Federal Power Commission is called into question in some of the issues. In its answer the Tennessee commission declares that the record of the company, in its dealings with the commission, has been one of "misrepresentation, duplicity, fraud and deceit." The commission demurs to the bill on fifteen separate grounds. The Holston River Power Company, named as a second defendant in the suit, likewise demurs to the bill and claims the petitioner is seeking to dam a navigable stream without obtaining federal permission. Decision was deferred by the court.

KANSAS ELECTRIC POWER CUTS RATES HEAVILY. — Voluntary rate reductions of 20 to 25 per cent for average domestic consumers throughout the territory served by the Kansas Electric Power Company, with headquarters at Lawrence, have been approved by the Kansas Public Service Commission. Such reductions, affecting 30 cities and towns, will go into effect in June. These decreases are probably the largest and most widespread to be made by one Kansas company for several years. The reductions have a bearing on the announced purpose of the state commission last fall to bring about a greater uniformity in electric rates in Kansas. At that time, acting on recommendations of John H. Fletcher, chief engineer for the commission, that body indicated that unless other electric companies voluntarily lowered rates to conform more closely to those of the Kansas Gas & Electric Company of Wichita, the commission would proceed to require a leveling of rates, and it has since then been taking steps to achieve that object. The Wichita concern has a uniform rate in all 64 towns in its territory, irrespective of size.

LATEST GEOLOGICAL SURVEY REPORT ON UMPQUA RIVER. — The Umpqua River basin in southwestern Oregon possesses huge potential power resources. They exceed those of any one of more than half of the states, according to a statement just issued by the Department of the Interior through the Geological Survey. There is, however, but one small developed site in the basin, on North Umpqua River near Roseburg, where a plant of 1,900 hp. has been built. A permit to investigate power sites at Rock Creek, Boundary, Toketee Falls and Lemolo Falls, on the North Umpqua River, and one on Clearwater River has been issued by the Federal Power Commission. Twenty-two power sites are proposed by the Geological Survey for the Umpqua and North Umpqua Rivers, fifteen power sites for the South Umpqua River and Fish Lake Creek and eleven power sites for tributaries. The total potential power of the Umpqua River basin without storage is 247,000 hp. for 90 per cent of the time and 584,000 hp. for 50 per cent. With storage these figures can be increased to 369,000 hp. and 561,000 hp. With unified operation the low figure could be increased to 400,000 hp., of which 350,000 hp. would be developed on the Umpqua and North Umpqua.

HIGH-TENSION LINE FROM FORT WAYNE, IND., TO MARION, MUNCIE AND KOKOMO.—A double-circuit 132-kv. transmission line will, it is announced, soon be built from Fort Wayne to Marion, Ind., a distance of 58 miles, by the Indiana General Service Company, at a cost of $2,500,000. At Marion the line will be divided, one double circuit going 28 miles to Muncie and the other extending 26 miles to Kokomo. At Marion a 20,000-kw. switching and stepdown substation will be built, while at Muncie there will be one of 35,000 kw. capacity. The company does not expect to shut down its plants in either city, O. M. Drischel, general manager at Marion, says. This line will join Muncie to the interconnected system of the American Gas & Electric Company.

## Recent Court Decisions

ORDINANCE REQUIRING OPERATORS OF MOTOR-DRIVEN MACHINES TO BE LICENSED AS STEAM ENGINEERS FOUND VOID.—A New York City ordinance adopted in 1921 requiring operatives on machines driven by electric power to pass examinations and be licensed as steam engineers was declared unconstitutional and void in a decision by the State Supreme Court rendered in injunction suits brought by the Ice Service Corporation and others, together with two employees representing workers in the several companies. It was contended that the operatives prior to the passage of the ordinance had efficiently operated machines driven by electricity, but, not being trained steam engineers, were barred from continuing such work, though it did not require engineering experience or training.

ORDER OF COMMISSION GOVERNING HEIGHT OF TRANSMISSION LINE APPLIED TO EXISTING AS WELL AS FUTURE LINES. —Howell vs. San Joaquin Light & Power Corporation was a suit to recover damages for the death of a man who raised a water pipe perpendicularly to clean it and was killed by its making contact with a line carrying voltages as high as 17,000 and having only about 19 ft. clearance over the farm land where the man was working. A finding for the plaintiff on the ground of negligence was sustained by the District Court of Appeals in California. The line had been originally erected at a height of 23 ft. but had sagged 4 ft. It had been erected previous to an order of the California Railroad Commission fixing 25 ft. as the proper minimum height for such lines, but the court held that this order, though it had no retroactive effect, applied to lines existing at the time it was made as well as to new lines, and that the company's failure to maintain the line in question at the ordered clearance was negligence *per se* and properly submitted to the jury, along with the question of contributory negligence by the deceased. (261 Pac. 1107.)*

## Commission Rulings

READY-TO-SERVE CHARGE BASED ON NUMBER OF ROOMS NOT DISCRIMINATORY. —The Public Service Commission of Pennsylvania dismissed a complaint brought against the Northern Pennsylvania Power Company based upon an alleged discrimination resulting from the fact that the company's tariff included a ready-to-serve charge computed according to the number of rooms served. The company showed that of the 2,058 residential or domestic consumers in the district to which this schedule applies, 1,099, or 53 per cent, would be benefited by taking service under it. Those who chose to do so could continue under the old schedule, receiving service as heretofore and having the option of changing to the other schedule should they so alter the manner of use to make the change advantageous to themselves.

"ROOM RATES" NOT APPLICABLE TO SMALL VILLAGE. — The North Dakota Board of Railroad Commissioners in fixing electric rates for the Farmers' Elevator Company, which operates an electric utility in connection with its elevator, said: "The schedule of rates now in effect, which is based upon the so-called 'room-rate' schedule, is not readily understood and, in our opinion, a more simple schedule would result in less conflict. While the room-rate schedule may be practicable in a city the size of Fargo, we doubt the wisdom of adopting such a schedule in a village with a population of 200. It is our recommendation that the Farmers' Elevator Company file with the commission within 30 days a rate schedule constructed upon a kilowatt-hour-per-month basis. . . . We will also require the company to install a system of accounting which will more clearly show the actual operating expenses of the electric utility as distinguished from the operations of the company as a whole."

'ROOM RATE" DEMAND CHARGES UPHELD.—A "room-rate" demand charge of an electric utility was said by the New Jersey Board of Public Utility Commissioners, in adjudicating a complaint listed as Sullivan vs. Rockland Electric Company, to be the result of an endeavor by the electric utility to measure the demand element in the cost of operation by some simple and easily understood rule and to distribute the cost of extra equipment used during peak demands equitably among such consumers as made the most use of such equipment. In dismissing a complaint against such a "room rate" it was said that in any revision of rate schedules, especially when such schedules effected a consolidation of two or more classes of service into one schedule, there may be some customers who suffer prejudice thereby, but that if this prejudice be not unreasonable and the greatest good is afforded to the greatest number, such prejudice should not stand in the way of an otherwise desirable form of rate schedule. In the particular instance before the commission the testimony indicated that only 24 customers would have higher bills, while upward of 4,000 would be benefited by composite reduction in charges approximating $20,000, and that costs were reasonably allocated. All customers taking lighting service alone would have decreased bills.

# News About Men of the Industry

## *J. B. Miller Thirty Years With Edison Company*

John B. Miller on Feb. 1 celebrated the completion of 30 years' service with the Southern California Edison Company. In 1898 Mr. Miller became associated with the Edison Electric Company, predecessor of the present organization, in the capacity of treasurer, which position he held until 1901, when he was elected president, the position which he has held continuously for the intervening 27 years. In 1896 Mr. Miller, then 27 years of age, visited Southern California for the first time and within two years had launched upon his life's work. His first task was to amalgamate several small power companies and to organize larger and more efficient operating units, the present Southern California Edison Company, operating in ten counties of southern and central California, being the result.

J. B. MILLER

In addition to being the directing officer of the Edison company Mr. Miller is president of the Landowners Company, president San Joaquin & Eastern Railroad Company, chairman of board Electrical Products Corporation, director Los Angeles First National Trust & Savings Bank, Pacific Mutual Life Insurance Company, Federal Telegraph Company of Delaware, Pacific Finance Corporation, Pacific Indemnity Company, Bellows Claude Neon Company, Detroit; Claude Neon Federal Company, Chicago; Claude Neon Lights, Inc., New York, and Diamond Electrical Manufacturing Company.

## *L. P. Sweatt Vice-President of Mississippi Company*

**L. P.** Sweatt, Jr., general manager of the Mississippi Power Company, Gulfport, Miss., since its organization, has been elected vice-president of that utility. At an early age Mr. Sweatt became interested in the public utility industry. For several years he was employed in the railroad branch of the business before entering the Alabama Polytechnic Institute at Auburn and he financed his technical education at that institution by acting as chief engineer of the power plant furnishing electricity to the college and city of Auburn.

Mr. Sweatt started with the Alabama Power Company in the capacity of a helper in substation maintenance, and step by step he has advanced, serving successively as foreman of substation construction, member of the commercial department, superintendent of the western division, manager of that division, manager of the eastern division and manager of the southern division. It was in 1925 that Mr. Sweatt assumed the duties of general manager of the Mississippi Power Company, which he will continue to carry on in addition to those pertaining to his new position.

E. C. **Brandt**, who has been connected with the Westinghouse Electric & Manufacturing Company since 1905, has been appointed assistant works manager of the East Pittsburgh works.

## *E. W. Dillard Receives New Appointment*

Edward W. Dillard has been appointed electrical engineer of the New England Power Company system, following eight years' service in the electrical engineering department of that organization. Mr. Dillard is a native of Alabama, was educated at the Alabama Polytechnic Institute and at one time was employed by the General Electric Company and then by the Alabama Power Company. He joined the staff of the New England Power Company at Worcester in 1916 as chief of tests, being in charge of all meter, relay, oil circuit breaker and telephone inspection and maintenance for two years. In 1919 he entered the department which he now heads, and for some time specialized in problems of relay operation and maintenance, acquiring a high reputation as a specialist in this field in the New England territory.

E. W. DILLARD

## *N. E. Funk Chief Engineer of Philadelphia Electric*

Nevin E. Funk, who has been assistant chief engineer of the Philadelphia Electric Company for the past year, has been appointed chief engineer of that company to succeed the late William C. L. Eglin. Mr. Funk affiliated himself with the Philadelphia utility nineteen years ago and during this period of service he has been closely identified with the planning and operations of the three large generating stations as well as with the huge hydro-electric plant now being constructed at Conowingo. A graduate of the Bloomsburg (Pa.) State Normal School and of Lehigh University, Mr. Funk entered upon his engineering career as an apprentice with the Westinghouse Electric & Manufacturing Company. Subsequently he was identified with the New York Central Railroad and later with the teaching staff of the Georgia School of Technology.

N. E. FUNK

He started with the Philadelphia Electric Company as assistant foreman in the station electrical construction department, occupying successively the positions of assistant superintendent, combustion engineer, superintendent of Schuylkill station, assistant operating engineer, operating engineer and assistant chief engineer.

Mr. Funk is a member of the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, the American Society for Testing Materials and other technical organizations, and has been active in the work of the prime movers committee of the National Electric Light Association.

**Austin D. Barney** has been elected general counsel of the Hartford Electric Light Company, Hartford, Conn., to succeed the late Judge William F. Heeney. Mr. Barney has been with the company as an attorney for several years and was assistant to Judge Heeney.

### *Stocks React Drastically*
### *Money Rates Firm*
### *Bond Prices Unaffected*

THE drastic downward readjustment through which the securities markets have passed within the last week brought several of the utilities down sharply, although as a group they were affected less than most of the other main groups. The average of a representative group of fifteen power and light common stocks reacted from 130 to 127, the former figure being the high point for these issues for all time. Brooklyn Edison lost eight points, to 226; Edison Electric Illuminating of Boston dropped eleven points, to 254; Pacific Gas & Electric is down twelve points, to 182; Montana Power reacted to 147 from a recent high of 165.

More attention, evidently, is being paid to money rates, in response to the action of the Federal Reserve banks. Rate increases were introduced by three of the reserve banks, Chicago, New York and Richmond. In the middle of February a 4 per cent rate was in effect in ten of the twelve reserve districts. Increases were made, apparently, in anticipation rather than as a result of increased demand for funds.

While it has had a radical effect on the stock markets, this general firming of money rates has had no apparent effect on the prices of higher grade bonds. The better class of power and light bonds are stated to be in just as keen demand as before these rate adjustments, although selling has been heavy in classes of bonds other than the utilities.

PHILADELPHIA ELECTRIC ELECTS NEW DIRECTORS.—At a recent meeting of the board of directors of the Philadelphia Electric Company Arthur W. Thompson, president of the United Gas Improvement Company; Samuel T. Bodine, chairman of the board of the United Gas Improvement Company, and William H. Taylor, formerly vice-president of the United Gas Improvement Company and now president of the Philadelphia Electric Company, were elected members of the board. These three new members are replacing Walter H. Johnson and A. V. R. Coe, resigned, and W. C. L. Eglin, deceased.

### American Superpower to Recapitalize

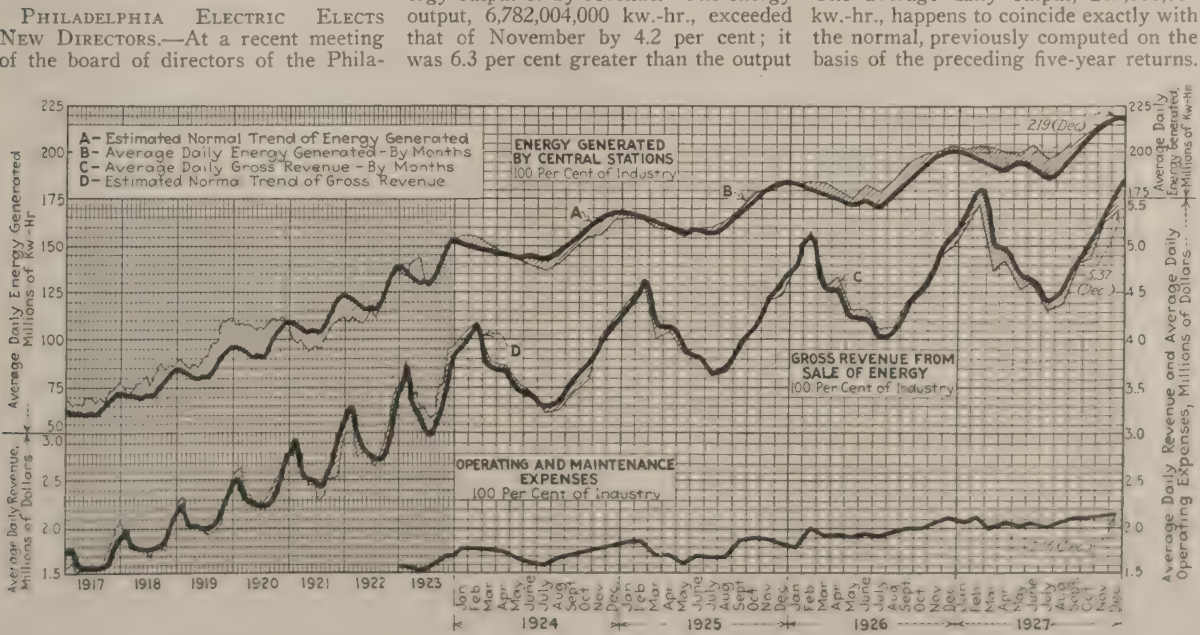
Revision of the capital structure of the American Superpower Corporation has been announced by President L. K. Thorne. The proposed plan calls for the immediate retirement of the outstanding participating preferred stock, the proceeds for which will be raised through the sale of additional class "A" common stock at $33 per share. This stock will be offered to all common stock holders, class A and class B, of record Feb. 20, 1928, on the basis of one share for each four shares held. In addition to the common stock the company has offered for sale 90,000 additional shares of first preferred stock, the proceeds of which will be used to finance certain large investments recently made by the corporation.

Stockholders also will be asked to approve the creation of a new class of preference stock (junior to the first preferred stock) cumulative as to dividends at the rate of $6 per share annually, and callable at $107.50 per share. If this proposal is approved the directors will distribute the stock to common stock holders on the basis of one share of new preference stock for each five shares of class A or class B common stock held. The additional common stock subscribed for at $33 per share on or before March 6 will receive its pro rata share of new preference stock.

## December Operations Greater Than Ever Before

### Revenue of $166,200,000 Exceeds Previous Peak—Energy Output, 6,782,000,000 Kw.-Hr., Also Breaks Records—Water Power Furnishes Nearly 40 Per Cent

NOTWITHSTANDING the slowing down of business activity in general toward the end of 1926, December operations in the electric light and power industry were greater than ever before, whether measured by energy output or by revenue. The energy output, 6,782,004,000 kw.-hr., exceeded that of November by 4.2 per cent; it was 6.3 per cent greater than the output of December, 1926. Both of these figures, while in harmony with the strong upward trend that has characterized the industry since its inception, are slightly below the usual seasonal and annual increase, respectively. The average daily output, 219,000,000 kw.-hr., happens to coincide exactly with the normal, previously computed on the basis of the preceding five-year returns.



## TABLE I—GENERATION AND DISTRIBUTION OF CENTRAL-STATION ENERGY IN THE UNITED STATES

(100 Per Cent of the Industry)

| Dec... | 6,782,004 | 6,375,500 | +6.3 | 5,592,004 | 5,247,500 | 1,500,000 | 1,400,000 | 3,462,004 | 3,226,500 | 630,000 | 621,000 | 1,190,000 | 1,128,000 | 1,286,000 | 1,175,000 |

*Data on "energy generated" are those collected and published by the United States Geological Survey for all public utilities minus such data as are collected on energy generated by electric railway companies, reclamation service and manufacturing plants. The data are, therefore, for the electric light and power industry only

The revenue, $166,200,000, exceeded the previous maximum of $162,000,000 attained in January, 1927. It was equivalent to a daily average of $5,370,000. This is but little less than the maximum ever recorded, which happened last February, when payments for a long month of heavy energy consumption were concentrated into a short one. The month's revenue exceeded that of December, 1926, by 7.3 per cent, and in accordance with the usual seasonal swing was 5.2 per cent higher than in the preceding month, but it fell about 5 per cent short of the estimated normal, based on former years.

This December departure downward from the computed normal is not new; it occurred both in 1925 and in 1926, whereas in some other years the variation was upward.

Operating expenses, which on the basis of returns received are estimated at $67,100,000 for the industry as a whole, were but 5.8 per cent higher than the year before, so that despite the moderate increase in gross revenue the net rose 8.4 per cent. In certain instances reports of operating expenses showed an actual reduction, suggesting a definite policy of retrenchment, but in general there is no evidence of drastic economies.

Of the total energy output 2,689,900,000 kw.-hr., or almost 40 per cent, came from water power. The increase of this item was 13.1 per cent, whereas the energy generated from fuel was only 2.3 per cent greater than in December, 1926. Thus, more than half the increment was borne by water power. Production of energy from fuel shows continued improvement in efficiency. The increased output was achieved with 2.6 per cent less coal and 21.1 per cent less fuel oil; the reduction far outweighs the 31.6 per cent increase in the consumption of natural gas. Oil consumption, while greater than in recent months, continues extremely low compared with previous years.

Regional analysis of the changes in energy output, compared with December, 1926, indicates an increase in New England of 1 per cent, in the Atlantic States of 6 per cent, the North Central 6, the South Central 10, and in the Western States of 4 per cent. The most rapid growth continues to be in the Southwest. Similarly the revenue rose, in New England 5.9 per cent, in the Atlantic States 6.0 per cent, North Central 9.7, South Central 9.7 and in the Western States 4.7 per cent.

The increasing use of energy for industrial purposes is apparently reflected in the gradual flattening of the output curve. During the past two years the seasonal fluctuations have been smaller than before. The winter peaks have checked quite closely with the values estimated in advance based on previous growth, but the summer sag has been very much smoothed out.

## TABLE II—OPERATING RATIO OF CENTRAL-STATION COMPANIES

| Month | Operating Ratio | | | | | |
|---|---|---|---|---|---|---|
| | Steam Plants | | Hydro Plants | | Combined Hydro and Steam Plants | |

*As collected by United States Geological Survey. The data are for the electric light and power industry only.

Company to issue and sell on or before June 1, 1928, at not less than 96 per cent of face value, plus accrued interest, $20,000,000 of first and refunding mortgage gold bonds, series "E," bearing interest at the rate of 4½ per cent per annum, and to use the proceeds to pay in part for the properties of Coast Valleys Gas & Electric Company and Western States Gas & Electric Company, and to refund outstanding bonds or notes of those companies.

## Electric Bond and Share to Change Set-up

At recent meetings of the boards of directors of the Electric Bond & Share Company and the Electric Bond & Share Securities Corporation it was determined to recommend to the stockholders of the two companies that the authorized shares of the capital stock of each of the corporations be increased. It is proposed to authorize an additional 1,000,000 shares of common and an additional 1,000,000 shares of preferred stock of Electric Bond & Share Company and to increase the authorized shares of common stock of the Securities Corporation from 1,802,870 to 4,000,000. Meetings have been called for March 5, 1928.

# Public Service of Northern Illinois Increases Net 15 Per Cent

Although Public Service Company of Northern Illinois did not show so great a growth in 1927 over 1926 as in 1926 over 1925, the progress made was almost as great. Gross revenue increased 11.8 per cent, as against 12.9 per cent the previous year. Operating costs were unusually well regulated, showing an increase of only 9.7 per cent, allowing for a 15.2 per cent expansion in net operating revenues during the period.

After all deductions gross income showed a growth of 13.9 per cent, against 14.5 per cent a year ago. The amount available for dividends in 1927 was $5,186,013, an increase of 5.9 per cent. Of this amount, $3,443,914 was distributed as dividends and $1,742,098 was added to surplus. It will be noted that rate reductions were made from time to time, and such reductions lowered the increase in operating revenues and the amount available for dividends on preferred and common stock for 1927 by about $685,000.

Total sales of electricity for the year, in kilowatt-hours, were 739,718,878 against 597,061,783 for 1926. Exclusive of sales to other electric companies, electric sales totaled 551,556,023, an increase of 13 per cent over 1926. The gain in total connected lighting load, over 1926, was 19 per cent. The total contracted power business for the year amounted to 55,250 hp., a gain of 21 per cent over 1926.

The financial set-up of the company was altered during the year by the issue of $10,000,000 in principal amount of 5 per cent debentures due August, 1932, and $750,000 of first lien and refunding 5 per cent mortgage bonds, series C, of 1966. Returns were used to purchase property and equipment, to acquire at par $4,245,000 of the first mortgage bonds of the Waukegan Generating Company and to refund certain of the company's own bonds. Furthermore, 3,500 shares of no-par common stock were sold to employees at an advantageous price.

Interest charges for the year were earned 2.4 times.

## Utility Offerings Total $32,000,000

New offerings by electric light and power companies during the week ended Feb. 23 amount to $31,637,500, three companies contributing to this total. The largest individual issue was offered by the National Public Service Corporation in the form of secured gold debentures, priced at 93½ and accrued interest to yield over 5.35 per cent, a piece of financing involving a sum of $20,000,000. These securities, dated Feb. 1, 1928, mature Feb. 1, 1978. Proceeds from their sale will be used for retiring the company's thirty-year 6½ per cent sinking fund collateral trust gold bonds now outstanding and for other corporate purposes. These secured gold debentures will be a direct obligation of the National Public Service Corporation.

The American Superpower Corporation, which has drawn up a plan for the revision of its capital structure, as announced elsewhere under "Financial and Statistical News," issued 90,000 shares of first preferred stock at $102.50 per share and accrued dividends, to yield 5.85 per cent. Proceeds will be used for the acquisition of additional interests in certain electric light and power companies and for other corporate purposes. This stock is cumulative as to dividends at the rate of $6 per share per annum.

With the purpose of refunding short-term loans outstanding the New England Public Service Company issued 25,000 shares of $6 dividend series preferred stock, the price being $96.50 per share and accrued dividends to yield over 6.20 per cent. Cumulative dividends are payable quarterly.

## California Edison Seeks Stock Authorization

Southern California Edison Company has made application to the Railroad Commission of the State of California for permission to issue some $6,000,000 of new common stock to be sold to shareholders at par $25 on the basis of one new share for each ten shares of common or original preferred stock held. The $6,000,000 stock issue is approximately 20 per cent of the estimated budget for construction and expansion for 1928. R. H. Ballard, vice-president, has announced that financing part of the budget each year through issue of rights to common stock holders will be a permanent feature. Hitherto it has been the practice of the company to give shareholders rights, but these were issued at no stated periods.

# Code to Recognize "Thin Wall Conduit"

## Mass of Detailed Agenda Prevented Final Action—Correlating Committee Appointed and Electrical Committee to Meet Again in Time to Offer 1928 Code in Fall

HARMONIOUS action toward the recognition of electrical metallic tubing, known to the trade as "thin wall conduit," in the code took place at the meeting of the electrical committee of the National Fire Protection Association last week. The report of the article 5 committee on thin wall conduit was presented by A. Penn Denton and a minority report was submitted by W. H. Blood. With the concurrence of Mr. Blood and Mr. Denton both reports were ignored and the committee discussed each principle separately. Out of the discussion the committee evolved eight points as given elsewhere on this page.

Owing to the heavy agenda covering a mass of detail the electrical committee was unable to discuss anything but the principles of the reports submitted. The usual attention was given to articles 1, 2, 3, 4, 6, 7, 8, 9 and 10. In order to have a 1928 code a motion was made by L. P. Dendel as follows:

> Because the field of National Electrical Code users, code administrators and other interests, including manufacturers, were promised by this electrical committee at our 1927 meeting that at the 1928 meeting of this committee a code would be produced taking into account the evident field needs, and, because of the absolute need that the code be correlated and be consistent and overlook no serious needs by mere failure to give them proper attention or by reason of no means provided prior to this meeting for correlation of article committee reports and, because our responsibility as code makers is seriously challenged if we cannot get out the necessary code revisions promptly to care for field needs and, because the National Electrical Code is expected by the field to give this needed guidance in the interest of economy and safety;
>
> It is therefore moved that a correlating committee be chosen at this time, subject to later additions to its personnel. That there be not less than seven members, one of whom shall be the chairman of the editorial committee. That any article committee chairman who desires may be a member. That there be a majority of inspector members, who shall be understood to be acting, not as individuals, but for and under advice of their constituent inspector associations and that all recognized industry associations be so represented. That the chairman of the correlating committee be selected by the main committee.
>
> The correlating committee is hereby instructed to co-operate with article committees to whom reports have been referred back for revisions so that such article committee work is completed within the next sixty days from today (Feb. 17, 1928), and so that the correlating committee may bring in a report by May 1, 1928. This correlating committee report to be distributed immediately to all members of this electrical committee, in order that this committee may meet and take formal action on a new 1928 code not later than July 1, 1928, thus making the complete new code available to the field by the early fall of 1928.

### Article 5 to Be Divided

The correlating committee was instructed to use generally the text of the 1925 code and to incorporate only what seemed to be necessary new ideas. A motion was passed instructing the editor of the code to divide article 5 into two, three or more chapters because its present size imposed too much of a burden on any one committee. The report of the committee on article 8 to have a new 0-15-amp. fuse cutout in which higher rating fuses could not be used was indorsed by the committee and the Underwriters Laboratories was instructed to work out a standard for such a fuse and report on it next year.

### Demand Factor for Feeders Adopted

The recommendation for a diversity factor, termed by the committee a demand factor, on mains and feeders was adopted in principle with some few changes in text covering principally its application to service conductors and modifications with respect to heating appliance loads. The method of estimating the demand factor will be provided in the code and depends on the diversity of load on the feed such that the maximum demand is less than the total connected load.

No action was taken on the grounding of portable appliances but A. R. Small was instructed to call a general meeting of all interested and to report the result to the committee. The electrical committee did not support the minority report of Mr. Blood regarding the use of the circuit wire for grounding in the case of non-metallic sheathed cable. The committee passed in principle rules regarding gas tube signs and X-ray apparatus which for the first time will appear in the code. The article 16 committee sponsored a table which will provide for special circuits in laundries, kitchens and bath rooms of residencies and provides for a 25-amp. circuit for plugging in 2,000-watt heaters. The correlating committee will develop specific rules to cover such special 25-amp. circuits and will present them at the proposed electrical committee meeting later in the year.

A resolution was presented by W. H. Blood at the end of the meeting calling for the appointment of a special committee to study the entire code making system and report upon six specific items and report to the electrical committee at the next annual meeting. The resolution presented by Mr. Blood is as follows:

> Whereas it is desirable that the National Electrical Code should continue to have the respect and confidence of the electrical industry, and at all times should be recognized as an American standard for universal acceptance, and,
>
> Whereas the present procedure in the revision of rules and especially in the consideration and adoption of new electrical devices and systems is slow, tortuous, productive of undesirable expense and tends toward commercial strife, and,
>
> Whereas for the benefit of the entire electrical industry and for the public at large these conditions should be corrected; therefore be it
>
> Resolved: That the chairman of the electrical committee appoint a special com-

### *Rules for Electrical Metallic Tubing*

Points set up by the electrical committee of the N.F.P.A. in regard to electrical metallic tubing known to the trade as "thin wall conduit."

1. To extend recognition to electrical metallic tubing of circular cross section.

2. To specify that when installed it will be readily identifiable as compared to standard conduit. The electrical committee has left it to the Underwriters Laboratories to specify the distinguishing features necessary for electrical metallic tubing.

3. That electrical metallic tubing shall have the same nominal inside diameter as standard conduit.

4. That only threadless fittings of approved design shall be used.

5. That trade sizes shall be ⅜ in. for under-plaster extensions only and ½ in., ¾ in., and 1 in.

6. Its use shall be limited to circuits using not larger than No 8 wire and carrying not over 35 amp. at voltages not exceeding 300 between conductors or 150 to ground.

7. To be installed as a complete system without wires continuous from fitting to fitting and the entire system firmly secured in place. It is not to be used in places where during installation and afterwards it may be subjected to severe mechanical injury. It shall not be imbedded in masonry, concrete or fill in buildings during their course of construction.

8. If of non-corrodible material it shall have a wall thickness and physical properties equivalent to the electrical metallic tubing being considered.

mittee to be known as the "committee on procedure" and that this committee consist of seven (7) members, the chairman of the electrical committee to be one and ex officio chairman of the committee on procedure and further that the committee consider and report upon the following matters:

1. The present membership of the electrical committee as to whether the proper organizations are represented best to secure an electrical code which may continue to be respected as national in principles and scope.
2. The size of the committee and members of representatives to which the various organizations should be entitled and whether other than representatives of national organizations should be included.
3. Methods for best considering changes in the code and additions to the code on their merits, regardless of other considerations.
4. The advisability of restricting voting privileges of those who are bound by commercial considerations.
5. Methods for improving present procedure which will simplify it and facilitate the adoption of new electrical devices and systems, retaining necessary safeguards, but making it possible for inventive genius promptly to be acknowledged and the public to be given the advantage of progress in the art without unnecessary delays.
6. The best and most practicable methods of co-ordinating the code, now and in the future, in order to make it a set of intelligent rules devoid of verbosity and textbook phraseology.
7. That a report of this committee be made at the next annual meeting of the electrical committee.

# 1927 Rate of Production Maintained

## January Activity in Electrical Manufacturing Plants on Level With January, 1927—Normal Trend Indicated for Next Few Months

THAT the electrical manufacturing plants of the nation are operating at approximately the same level as that reported at this time last year is indicated by reports received by ELECTRICAL WORLD on the monthly electrical energy consumption by a large portion of these plants. The rate of production of electrical equipment and supplies during January was about 0.6 per cent under December and 4.4 per cent under November, but was at exactly the same level as reported for January, 1927. A study of the operations in past years indicates that these monthly decreases in activity since October are normal, and that similar monthly decreases in the rate of activity may be expected in the industry until May or June, when the low point of monthly operations should be reached.

The index of activity in the electrical manufacturing industry, based upon consumption of electrical energy, stands at 124.7 for January, as compared with 125.4 for December and 124.8 for January, 1927. Comparative indexes of productive activity referred to the average activity for the period of 1923-25 as 100 and adjusted for number of working days are as follows:

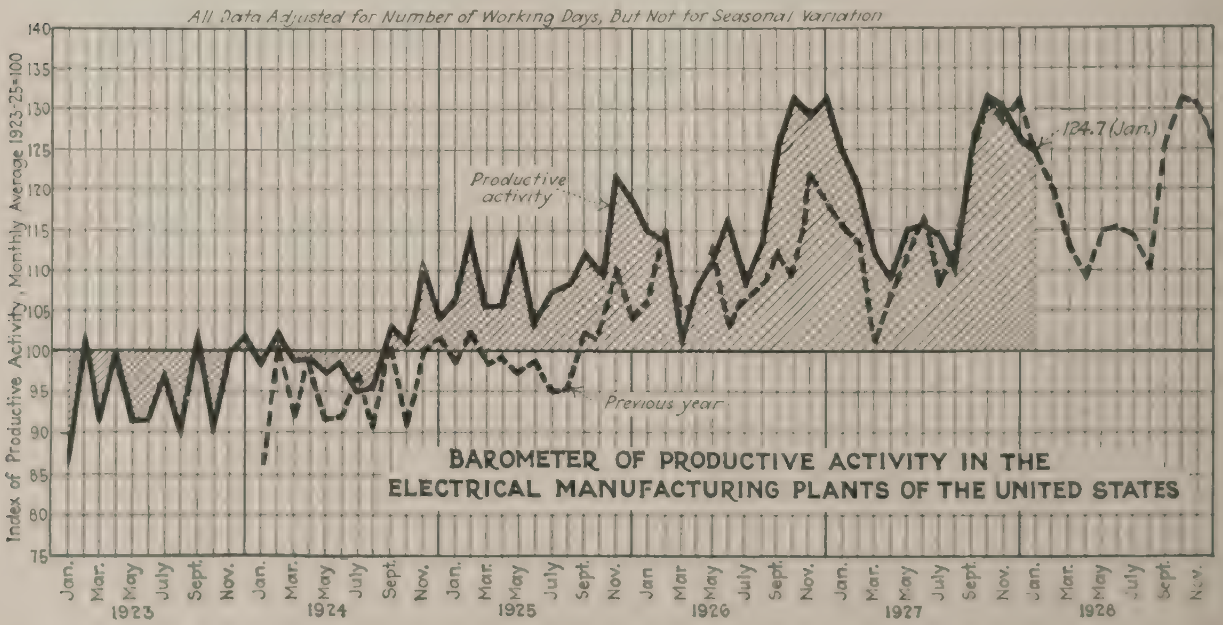
| | |
|---|---|
| January, 1928 | 124.7 |
| December, 1927 (revised) | 125.4 |
| November, 1927 | 130.4 |
| January, 1927 | 124.8 |
| January, 1926 | 115.0 |
| Average for full year, 1927 | 119.5 |
| Average for full year, 1926 | 116.6 |

Operations of American industry in general during January were about 9.2 per cent over those reported for December, an increase in the rate of operations being reported by all of the outstanding industrial groups except food, lumber and paper. An upward trend of considerable proportions is to be expected at this season of the year, but the fact that the impulse is felt by a very large proportion of the industrial groups instead of being confined to a few groups is a significant fact, offering an excellent basis for prognosticating a continuance of our present industrial prosperity, at least through the first half of 1928.

## Application of Industrial Trucks in Industry

A handbook entitled "Profitable Application of Electric Industrial Trucks and Tractors in Industry" has been published by the Society for Electrical Development as a co-operative measure of twenty manufacturers of electric industrial trucks and tractors, storage batteries and accessories who are engaged in a market development program. The book is of interest to plant managers, department heads, efficiency experts, or any who have to do directly or indirectly with material handling in and about the warehouse and industrial plant. The handbook contains 96 pages and 136 illustrations.

With a special chapter for each of sixteen major industries the book is based on a survey of 200 typical plan operations made by a member of the survey committee of the American Society of Mechanical Engineers. For each of the industries, the operating processes and the particular type of truck suited to individual jobs are described. An outline of operating costs, together with a tabulation of direct savings effected by employing this means of equipment, is given.



# Market Conditions

ENCOURAGING activity in the sale of central-station supplies is noted in the New England district. Railroad companies are planning increased purchases, small motor sales are a little below the normal trend, but are steady, and negotiations for heavy equipment have fallen off. In the Eastern district manufacturers are encouraged with current business and report that inquiries are maturing in better volume. A manufacturer of substation equipment states that his plant is running on a capacity schedule for current deliveries, and a company making water turbines reports that business is improving, with a decided increase in February as compared to January.

In the Southeast an order was placed by a central-station company in Alabama for $90,000 worth of power transformers. Purchases by industrial plants are slow but inquiries are good. Improvement in sales is noted in the St. Louis district. A power company in the southwestern part of the district purchased a fair amount of distribution equipment, and several good orders for line construction materials have been shipped. Utility companies are active in the Middle West and are preparing for large line extensions in the spring. On the Pacific Coast an order placed by the Michigan-California Lumber Company of Camino covered about $42,000 worth of equipment. Oil field activity was another feature of the week's business.

## *Central-Station Supplies Active in New England*

Encouraging activity is reported in the sales of central-station supplies with the demand for new service lines and expansions quite marked. Orders for pole-line supplies included a good volume of wire and hardware and poles. One order for four cars of line materials is noted; another group of orders called for five car loads of cross arms, hardware and wire. Railroad companies are planning for greater purchases than during the past year and to date sales show an encouraging increase. Weatherproof wire sales are active, switch and control equipment demand is steady, and a temporary slackening of outside work has slowed up contractors' needs.

Small motor sales are a little below the normal trend but are steady and reached over $35,000 last week. Negotiations for heavy equipment have fallen off, and transformer inquiries are quiet. An order for two 20-kw. baking ovens was reported. Industrial lighting projects are being considered in good volume with school-house plans numerous. The Malden Electric Company plans to erect a new service station at a cost of about $100,000. New building contracts placed last week show a marked increase over previous years. The Brockton Ice & Coal Company, Brockton, Mass., has filed plans for an ice plant to cost $100,000.

## *Utility Companies Active in Middle West*

A slight slowing up or reactive tendency was noticeable in the Middle West in some lines, while in others expansion is going on steadily. Considerable activity in the steel, automobile and railroad industries is evident and industrial plant buying generally is good. The various utility companies are busy preparing for large line extensions in the spring. Considerable purchasing of apparatus is under way and several interesting orders were placed, including auxiliary motor switchboard equipment complete with appurtenances, settings for one reheat and two standard B. & W. boilers, two oil circuit breaker units, steel inclosed outdoor type isolated phase 15-kv. switches, four heater drain pumps and appurtenances arranged for motor drive, structural steel and iron valued at $50,000 and Mazda lamps valued at $160,000. Maintenance purchasing is quite high with a good demand for poles and pole line hardware. Jobbers' sales are normal. The acceptance of the new gyrator type washing machine by the public has had a stimulating effect on washing machine sales, one jobber placing a single order for 1,000 machines.

Construction projects are as follows: Springfield, Ill., plans a substation to cost $60,000. The Interstate Power Company has authorized surveys for a hydro-electric plant near Decorah, Iowa. The Houghton County Electric Company plans power plant expansion at Houghton, Mich., and extensions in transmission lines to L'Anse and Baraga, Mich. Detroit Lakes, Minn., will receive bids March 5, for a 500-kva. generating unit (and alternate bids for a 625-kva. unit) with auxiliary equipment, including motor-driven ash hoist, for the municipal power plant. The Northwestern Utilities Corporation has purchased the Mapleton Electric Company, Mapleton, Minn. The Nebraska Power Company will rebuild its power line from Millard to Chalco, Neb., for operation at increased voltage. Cedar Falls, Iowa, plans a transmission line to points in Mount Vernon Township. The Iowa Public Service Company plans the purchase of the municipal lighting plant at Jolley, Iowa. Arlington, Neb., has secured permission to build a transmission line for commercial service. The Elkhorn Valley Power Company plans a transmission line from Clarkson to Creston, Neb.

## *Non-Ferrous Metal Markets Dull—Prices Stable*

Little activity prevails in the copper market and prices quoted by large producers are steady, although some interests are willing to sell for several points less. The lead market is dull. consumers evidently feeling that prices are uncertain and that plenty of lead is available. Orders are mainly for prompt shipment. The zinc market has declined slightly. Tin, after the largest price decline in several years, appears stable.

NEW YORK METAL MARKET PRICES

| | Feb. 15, 1928 Cents per Pound | Feb. 21, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic.... | 14-14⅛ | 14 |
| Lead, Am. S. & R. price | 6.35 | 6¼ |
| Antimony............ | 11 | 10¾ |
| Nickel, ingot.......... | 35 | 35 |
| Zinc spots........... | 5.92½ | 5.80 |
| Tin, Straits........... | 51½ | 51.725 |
| Aluminum, 99 per cent | 24.30 | 24.30 |

Base copper wire price Feb. 21, 1928, 15⅝ cents.

## *Large Transformer Order Placed in Alabama*

Purchases by industrial plants in the Southeast are slow, though inquiries are good, and activities in the central-station field are improving slightly. A central-station company in Alabama ordered power transformers totaling $90,000 and a South Carolina power company ordered similar equipment to the extent of $13,500. House-type meters are in brisk demand, the majority of individual orders averaging $1,500, though two orders received from Tennessee aggregated $8,000 and one from Georgia amounted to $2,500. In connection with the change of its direct-current system to alternating current, one company ordered $6,800 worth of elevator equipment in the past few days. Another interesting central-station order called for switching equipment amounting to $7,900. Two turbine inquiries are in hand, one for an industrial plant and the other for a small utility company.

One manufacturer reports the receipt of an order from Alabama for a mine locomotive costing approximately $9,000, and two industrial motor orders from the same state, one amounting to $6,000 and the other, $3,500. There is considerable activity in connection with prospective textile mills to be located in this territory and although definite announcements are not immediately forthcoming all or a large portion of this should materialize within a reasonable period.

Construction projects reported are as follows: The E-Z Opener Bag Company, Decatur, Ill., plans a paper mill at Tuscaloosa, Ala., to cost $3,000,000. The Columbus Electric & Power Company, Columbus, Ga., is having plans drawn by Stone & Webster, Inc., Boston, for a hydro-electric plant on the Chattahoochee River, to cost $7,000,000. The Columbus company also will build a substation near Cusseta Highway, to cost $50,000. The Carolina Gas & Electric Company has acquired the municipal lighting plant at Kinston, N. C. The Carolina Power & Light Company plans a substation at Sanford, N. C., to cost $70,000. The Savannah River Electric Company plans a hydro-electric development on the Savannah River, near Greenwood, S. C., to cost $20,000,000. The South Carolina Power Company plans the purchase of the municipal electric plant at Walterboro, S. C. The Peter Fox Sons Company, Chicago, plans an ice and cold storage plant at Nashville, Tenn., to cost $350,000. The East Coast Utilities Corporation, Richmond, Va., plans a power plant at Port Richmond, to cost $40,000. Milledgeville, Ga., has contracted with the Georgia Power Company for an ornamental lighting system, and Louisville, Ky., also is planning an ornamental lighting system in its parks.

## *Utility Orders Encourage Eastern District*

Manufacturers in the Eastern district are encouraged with current business and the improved immediate outlook for additional commitments. Inquiries are maturing in better volume. A central-station company in the New York territory has placed a fair-sized order for special switching equipment for substation service, and further business is anticipated from that quarter. Another power company has contracted for switching apparatus of the 6,600-volt type, both for indoor and outdoor service. A large manufacturer of substation equipment of this character reports a growing volume of business from a number of sources, with its plant running on a capacity schedule for current deliveries. High-voltage insulation apparatus is beginning to move at a better pace and several important orders have been placed in the New York market. A manufacturer of water turbines states that business is improving, with a decided increase this month as compared with January. A public utility in Vermont has contracted for a sizable unit, while a paper mill at Lee, Mass., also placed an order for a prime mover.

Industrial business holds rather uniform. Motor sales continue fair, with popular industrial sizes in demand from several branches of trade, including ice cream factories, metal-working shops, paper mills, leather plants and textile mills. Fractional-horsepower motor sales are active, and a leading manufacturer has secured an order for 160 1/20-hp. motors for a company in Brooklyn, to be used for electric office appliances. Electric fan business is showing fair promise for early spring.

Immediate construction activities include the following: Steel & Tubes, Inc., Brooklyn, plans a steel strip mill at its Elyria, Ohio, plant, to cost $1,000,000; Perth Amboy, N. J., plans an ornamental lighting system on Maple Street. The Public Service Electric & Gas Company will build a substation at Ridgewood, N. J. The John A. Roebling's Sons Company, Trenton, N. J., will build an addition to its wire and cable plant to cost $500,000. The Philadelphia Suburban-Counties Gas & Electric Company plans an addition to its plant on Barbadoes Island, Schuylkill River, near Norristown, Pa., and extensions in transmission lines. The Viscose Company plans an addition to its rayon mill at Lewistown, Pa., to cost $400,000. The Pennsylvania-Ohio Power & Light Company has secured permission from the United States Engineer, Pittsburgh, for a transmission line across the Ohio River, near Girard, Ohio. The White Company, Baltimore, Md., will build an addition to its paint factory to cost $100,000. C. Hoffberger & Company, Baltimore, will take bids at once, to be received about March 10, for an eleven-story cold storage and ice plant to cost $900,000. The Chief of Engineers, United States Army, Washington, D. C., will soon take bids for a 1,200-kw. Diesel engine-generating set, with auxiliaries and one station switchboard. The United States Engineer, Pittsburgh, Pa., will receive bids until March 9 for two hydraulic turbines (Circular 274).

## *Improvement in Sales Noted in St. Louis District*

A slight improvement in business is noted in the St. Louis district. Not many large contracts have been closed but several are being figured. One order was placed for a 150-kw. generator and a switchboard for $4,300. A lot of feeder voltage regulators, transformers and oil circuit breakers were bought by a power company in the southwestern part of the district at a total cost of $55,000. Several good orders for line construction materials have been shipped out and two contracts closed for conduit, wire and fittings for large office buildings.

Construction projects in the district are as follows: Sterling, Kan., will extend its municipal power plant. The Shreveport Producing & Refining Corporation, Shreveport, La., will enlarge its oil refinery at a cost of $250,000. The Liberty Textile Mills, Liberty, Mo., plans a new cotton mill to cost $100,000. The Board of Public Service, St. Louis, will receive bids March 13 for a complete street-lighting system in district A. The Southern Ice & Utilities Company plans an ice plant at Odessa, Tex., to cost $75,000. The West Texas Utilities Company plans a power and ice plant at Sonora, Tex., to cost $75,000. The Texas Gulf Power Company plans an 8,000-hp. power plant at Texas City, Tex., to cost $200,000. The Southwestern Gas & Electric Company plans a transmission line to Hatfield and Cove, Ark., and vicinity. The Arkansas Power & Light Company plans rebuilding its 66,000-volt transmission line from Pine Bluff to Camden, Ark., to operate at 110,000 volts, at a cost of $185,000. Independence, Kan.; Poplar Bluff, Mo.; El Reno, Bristow and Muskogee, Okla., and Ozona, and Sweetwater, Tex., plan the installation of lighting systems.

## *Lumber Company Order Placed on Pacific Coast*

The outstanding order on the Pacific Coast covered a power installation for the Michigan-California Lumber Company of Camino, consisting of assorted General Electric motors from 2½ to 225 hp., totaling $20,000 with accessories, a 750-kva. Allis-Chalmers turbine, valued at $18,000, and Westinghouse switchboard and control valued at $4,000. Oil field activity was another feature of the week's business. One manufacturer reports five different orders, totaling $20,000, from three companies and comprising six double-rated well motors, one arc-welding equipment and a large automatic panel. The city of Los Angeles purchased $63,092 worth of weather-proof wire and the Southern Pacific Railroad three carloads of iron wire. The latter company is in the market for approximately $20,000 worth of lead cable for its new Fresno classification yard and also plans to build a new tourist hotel near Phoenix, Ariz.

Other new construction projects reported include a $1,000,000 convent and school for Belmont, Calif., and a $2,500,000 apartment house and hotel for Pasadena. New street lighting prospects include Berkeley and Willows. Machinery orders include an order for 200 1/20-hp. motors for calculating machines, valued at $2,500; two circuit breakers at $4,000 for the Alameda substation; one special quadruple motor equipment for $6,000 for an Oakland traction company, and a miscellaneous assortment for the Truckee Carson irrigation project comprising 220 distribution transformers, 250 watt-hour meters, 1,000 line insulators, 1,200 strain insulators and six lightning arrester units having a total value of $35,000.

Construction projects are as follows: The Southern California Edison Company plans a substation at Yorba Linda, to cost $150,000. The United Verde Copper Company, Clarksdale, Ariz., will build an electric steel foundry to cost $100,000. The Snow Mountain Water & Power Corporation, San Francisco, has applied for permission to build a 21,680-hp. hydro-electric plant on the South Eel River, Lake County, to cost $3,200,000. The Coast Counties Gas & Electric Company, Santa Cruz, Calif., plans a substation at Watsonville to cost $35,000. The Red River Lumber Company, Westwood, Calif., plans a hydro-electric plant on Ash Creek, a tributary of Pitt River, Modoc County, to cost $250,000. The St. Helens Pulp & Paper Company, St. Helens, Ore., plans an addition to cost $100,000. The Columbia Valley Lumber Company, Bellingham, Wash., plans a new mill to cost $100,000. The Northwest Power & Light Company has applied for permission to build a hydro-electric plant in Rica Canyon, near Port Angeles, Wash., to cost $2,000,000. Nogales, Ariz., and Compton, Los Angeles, and Pittsburg, Calif., plan street lighting systems.

# Activities of the Trade

## Allis-Chalmers Announces Changes in Pittsburgh Works

Effective March 1, 1928, the Pittsburgh Transformer Company, purchased by the Allis-Chalmers Manufacturing Company last year, is to be taken over and operated as the Pittsburgh Transformer works of the Allis-Chalmers company. The manufacture of the Pittsburgh types of distribution and power transformers will be continued at the Pittsburgh works in sizes up to and including 5,000 kva. single phase, and 15,000 kva. three phase at 44,000 volts; up to and including 4,000 kva. single phase, and 12,000 kva. three phase at 66,000 volts, and also all transformers for electric furnace work. The larger sizes of transformers and those for higher voltages and all transformers regardless of size or voltage, equipped with built-in tap changers to operate under load, will be of the Allis-Chalmers type and will be built at the West Allis works.

The Allis-Chalmers company in its announcement says that it appreciates the business given the Pittsburgh Transformer Company during the past years and earnestly solicits continued patronage. The district offices of the Pittsburgh Transformer Company have been consolidated with and will be operated as a part of the Allis-Chalmers district office organization with offices in all principal cities. With a larger organization, increased facilities and advanced manufacturing methods, as well as its extended service organization, the Allis-Chalmers company states that it is in excellent position to serve the industry in its transformer requirements.

---

The Hynes & Cox Electric Corporation, 406 North Pearl Street, Albany, manufacturer of "Red Crown" electric water heaters, has published a manual on electric water heating for salesmen. The manual has been compiled to enable salesmen to answer quickly and intelligently many of the questions which will be asked by prospects.

The Servel Sales, Inc., 51 East 42d Street, New York City, announces the appointment of John M. Bickel as manager of advertising and sales promotion. Mr. Bickel comes from the Magazine Repeating Razor Company, where he has been assistant general sales manager.

The Pacific Electric Manufacturing Company, 5815 Third Street, San Francisco, has opened offices in Seattle, Wash., at 516 Liggett Building, with Charles H. Cutter in charge.

The Belden Manufacturing Company, 2300 S. Western Avenue, Chicago, manufacturer of insulated wires and cables, has added to its cord department a new soft rubber plug for household appliances, office and store equipment, portable shop tools and other devices.

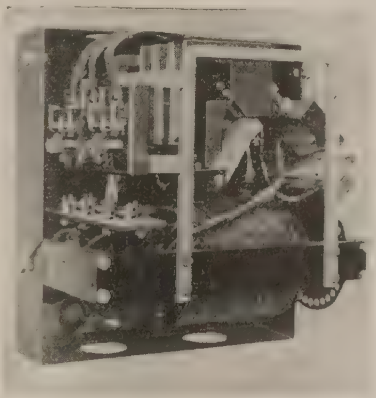
The Clifton Manufacturing Company, Boston, manufacturer of rubberized fabrics, announces that E. W. Kendall has been appointed manager of its electrical tape department in charge of all domestic and export tape sales effective March 1. For the last five years Mr. Kendall has been in the sales department of the Westinghouse Electric & Manufacturing Company. The Clifton company states that it will continue its constructive distribution policies through electrical jobbers.

The Lincoln Electric Company, Cleveland, manufacturer of "Linc-Weld" motors and "Stable-Arc" welders, announces the appointment of O. D. Fries as salesman in charge of consumer motor business in Detroit under the direction of J. M. Robinson, district manager.

# New Equipment Available

## Automatic Induction Starter

An automatic induction starter with two adjustable features has been announced by the Lincoln Electric Company, Cleveland. One of the adjustments is in the starting current and starting torque and is made by changing the position of the rotor in the regulator. This rotor is index mounted and the starting torque and starting current of the motor are increased by going to the higher numbers of the scale and decreased by going to the lower. The other adjustment is in the current at which the throw-over takes place. The throw-over is controlled by a retarding solenoid which is operated by the motor current. The pull of this solenoid can be adjusted by a simple lock rod arrangement carried on its plunger.



ADJUSTABLE STARTING CURRENT AND STARTING TORQUE ARE PROVIDED BY THIS AUTOMATIC INDUCTION STARTER

The manufacturer states that the starter can be mounted very easily. In mounting, the back cover is first secured to the wall. It is light and can be easily held and attached by one man. The back cover contains the conduit outlets. After the leads are drawn the switch may be set into the back cover and locked in position by a screw provided for that purpose. The conventional start and stop buttons are used in connection with the starter. If the front cover of the starter is removed the switch may be swung forward by the removal of the holding screw at the back. This brings the switch mechanism out where it is in a better position for observation. The barriers may also be moved upward out of the way. By the release of a screw on the control switch panel the contact carrying arm will drop back exposing all contacts for renewals or observation. The barriers completely inclose the contacts and six separate arc chimneys are provided to confine the arcs. The manufacturer states that with this barrier the switch can interrupt currents of ten times the rating without injury. The contacts in the switch are designed to give a wiping action. Overload protection is afforded by thermorelays and no-voltage protection by no-voltage release control.

---

Metering Panelboards.—A metering panelboard of the loose-wire type, which the manufacturer claims will handle any metering problems that confront the builder, has been developed by the Westinghouse Electric & Manufacturing Company, East Pittsburgh. Loose-wire connectionus replace the usual copper bus bars, directly lowering the price and speeding up installation. Four main types are being made. This panel is said to be particularly adapted to service in apartments and office buildings where frequent change of tenants makes meter changing an important item.

Automatic Dynamometer Control Panels.—A fully automatic control equipment for use with dynamometers in testing internal combustion engines has been placed on the market by the General Electric Company. The new control equipment consists of two panels, one a control panel and one a master panel. This arrangement permits mounting the master panel on the dynamometer base, providing complete control of the dynamometer at the point where the actual testing is being done. The automatic control panel, with its motor-operated rheostats and absorption resistor, is mounted at any suitable, remote place.

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued Jan. 3, 1928)

*1,654,949. Current-Regulating Arrangement for Rectifiers; P. M. Toulon, Paris, France. App. filed Dec. 21, 1923. To permit of regulating and continuously varying the rectified current.

(Issued Jan. 10, 1928)

*1,655,458. Gas-Burner Igniter; A. Dolfi, Yorkville, Ohio. App. filed May 4, 1927.

*1,655,689. Call Selector; L. L. Chauveau, Paris, France. App. filed Aug. 17, 1922. So arranged that the calling device is actuated only when the selector receives the predetermined group of signals for which it is adjusted.

(Issued Feb. 7, 1928)

1,658,254. Electrothermally Responsive Device; G. R. Radley, Milwaukee, Wis. App. filed Aug. 16, 1920. Susceptible to influence in accordance with both current and voltage variations.

1,658,259. Electric Rivet Heater; J. E. Sederholm, St. Paul, Minn. App. filed Dec. 8, 1924.

1,658,266. Suspending Device for Trolley Wires; F. A. Tice, Cincinnati, Ohio. App. filed Nov. 3, 1925.

1,658,315. Battery; E. B. Wheeler, New York, N. Y. App. filed June 22, 1927. Dry cell battery employing flat electrodes.

1,658,329. Protective System for Electric Circuits; P. W. Forsberg, Schenectady, N. Y. App. filed Nov. 3, 1925. For preventing the flow of currents of abnormal value in either direction in a circuit adapted to carry current in either direction.

1,658,334. Resistance Material; T. A. Holmgren, Stockholm, Sweden. App. filed Jan. 14, 1925. Electrically conductive in a cold state and usable at a high temperature. Consisting essentially of an intimate mixture of finely crushed silicon carbide and a refractory cementing medium, burnt until the cement has more or less sintered.

1,658,380. Electrical System; L. S. Keilholtz, Dayton, Ohio. App. filed July 11, 1919. Farm-lighting unit.

1,658,446. Bulb Adapter for Signal Lamps; L. C. Kuehner, St. Louis, Mo. App. filed June 28, 1926.

1,658,449. Fluid-Level Indicator for High-Pressure Vessels or Containers; S. Loffler, Berlin-Charlottenburg, Germany. App. filed July 10, 1925.

1,658,474. Cigar Lighter; M. T. Blier, Brooklyn, N. Y. App. filed June 8, 1927.

1,658,488. High-Frequency Alternator; M. Latour, Paris, France. (Granted under the provisions of the Act of March 3, 1921.) App. filed Sept. 1, 1921.

1,658,501. Electric Condenser; P. B. Vallé, New Haven, Conn. App. filed Nov. 14, 1925.

1,658,511. Switch; C. Bruynis, The Hague, Netherlands. App. filed Nov. 12, 1925. For switching 220-volt circuits and using a lower voltage for the operation of the switch.

1,658,522. Electrical Plug Connector; A. J. Frogue and J. I. Sloan, Kansas City, Mo. App. filed June 8, 1925. As used in automobile headlights.

1,658,568. Method and Apparatus for Maintaining Gaseous Conduction Discharges; D. McF. Moore, East Orange, N. J. App. filed July 22, 1922.

1,658,577. Regulator; C. H. Smoot, Maplewood, N. J. App. filed March 7, 1927. So constructed as to avoid hunting without loss of sensitiveness or power.

1,658,583. Electric Socket; B. D. Wells, Danbury, Conn. App. filed Sept. 10, 1923.

1,658,598, 1,658,599. Socket Construction; J. Hohl, Newark, N. J. Apps. filed April 22, 1921 and Nov. 21, 1922.

1,658,610. Safety Electric Fuse Igniter; N. M. Olevich, St. Clair, Pa. App. filed June 18, 1927.

1,658,615. Electric Oven Heater; H. O. Swoboda, Edgewood, Pa. App. filed Feb. 10, 1926.

1,658,618, 1,658,619, 1,658,620, 1,658,621. Liquid Flow Switch; W. W. Walker, East Orange, N. J. Apps. filed Aug. 26 and Oct. 1, 1924, May 26, 1925 and March 25, 1927. Mercury type.

1,658,635. Attachment Plug; F. P. Gates, West Hartford, Conn. App. filed Dec. 8, [illegible]

1,658,644. Control of Dynamo-Electric Machines; H. W. Liddiard, Rugby, England. App. filed Sept. 28, 1926. Connected in parallel and adapted to run at related speeds, as by being mechanically coupled together.

1,658,647. Alternating-Current Rectifier; L. B. Miller, Lynn, Mass. App. filed April 14, 1927.

1,658,651. Electric Furnace; R. B. Prindle, Schenectady, N. Y. App. filed Dec. 29, 1926. Means for sealing a furnace receptacle around an electrical conductor passing through the wall thereof.

1,658,660. Signaling System; O. C. Traver, Schenectady, N. Y. App. filed March 30, 1927. Wherein two members are related in synchronism in remotely situated transmitting and receiving stations.

1,658,662. Alternating-Current Commutator-Motor Regulating Apparatus; W. Welsch, Niederschonhausen, Germany. App. filed Sept. 25, 1926.

1,658,664. Variable-Ratio Transformer; F. F. Brand, Pittsfield, Mass. App. filed July 6, 1927.

1,658,677. Brush for Dynamo-Electric Machines; M. R. Hanna, Erie, Pa. App. filed July 18, 1927. Having a soft tip and a hard portion at approximately the top half.

1,658,692. Electric Heater; J. L. Schroyer, Oak Park, Ill. App. filed Dec. 9, 1924.

1,658,695. Circuit-Controlling Device; O. C. Traver, Schenectady, N. Y. App. filed Jan. 12, 1924. For controlling a circuit a plurality of times in succession at predetermined intervals.

1,658,699. Pressure-Difference Measuring Instrument; M. Weiss, Berlin-Friedenau, Germany. App. filed March 6, 1925.

1,658,703. Electric-Current Collector; G. W. Bower, Schenectady, N. Y. App. filed Nov. 27, 1925.

1,658,704. Protection of Electric Systems; M. D. Camhy, Berlin, Germany. App. filed March 11, 1926.

1,658,707. Signaling Device for Motion-Picture Machines; A. Costa, Donora, Pa. App. filed Oct. 31, 1923.

1,658,746. Lightning Arrester; C. P. Steinmetz, Schenectady, N. Y. App. filed Sept. 27, 1921. Formed of a plurality of discharge gaps arranged in series, each of the gaps being inclosed by a wall which separates the discharge electrodes of the gap.

1,658,752. Cable Terminal for Storage Batteries; W. F. Wilford, Fort Benton, Mont. App. filed Dec. 8, 1926.

1,658,787. Compression Rheostat; A. M. Levy, New York, N. Y. App. filed June 4, 1919.

1,658,788. Electrical Resistance Apparatus; A. M. Levy, New York, N. Y. App. filed Sept. 21, 1920. Of the compression type.

---

*Omitted from previous listings of patents as they were received from the Patent Office too late to be included in numerical order.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

An agency is desired in Pilsen, Czechoslovakia (No. 29,634), for advertising signs, household electric appliances, electric flash buttons and lighting appliances.

Purchase is desired in Warsaw, Poland (No. 29,660), of storage batteries.

A sole agency is desired in Florence, Italy (No. 29,633), for apparatus for electrical treatments and electric toilet equipment.

A sole agency is desired in Oslo, Norway (No. 29,662), for storage batteries.

Purchase or agency is desired in Dresden, Germany (No. 29,678), for ice cream cabinets, drink mixers, and restaurant-type toasters.

An agency is desired in Toronto, Canada (No. 29,631), for electrical power equipment.

An agency is desired in Barcelona, Spain (No. 29,668), for storage batteries.

An agency is desired in Strasbourg, France (No. 29,650), for radio sets and parts.

An agency is desired in Tientsin, China (No. 29,711), for electric refrigerating units.

An agency is desired in Rome, Italy (No. 29,632), for X-ray, related ultra-violet apparatus, and appliances for electric treatment.

Purchase is desired in Comayaguela, Honduras (No. 29,709), of Diesel or semi-Diesel crude oil motor and centrifugal pumps.

# New Trade Literature

DRUM CONTROLLERS.—Bulletin GEA-887 issued by the General Electric Company, Schenectady, N. Y., describes and illustrates its CR3110 drum controllers for series and compound wound motors used on crane hoists and for similar applications.

COLD MOLDED PRODUCTS—"Come Adventuring" is the title of booklet R-1 issued by the Cutler-Hammer Manufacturing Company, Milwaukee, in which it gives complete information on the C-H cold molded "Thermoplax," what it is, and the uses to which it can be put. It also contains photographic examples showing where small metal inserts, trademarks, depressions and projections have been incorporated in parts of various shapes and sizes at the time of molding.

AIRPORT LIGHTING EQUIPMENT.—The Crouse-Hinds Company, Syracuse, N. Y., is distributing bulletin No. 2108, describing and illustrating its various types of airport lighting equipment including revolving beacons, landing field illuminating units, boundary, obstacle and marker lights, hangar roof lighting and interior illumination units, etc.

BRACKETS and RECEPTACLES.—A pamphlet No. A1127 issued by the Bryant Electric Company, 1421 State Street, Bridgeport, Conn., covers the Bryant "Alabax" line of porcelain brackets and receptacles for all kinds of installations.

LIGHTING EQUIPMENT.—The Edwin F. Guth Company, St. Louis, is distributing its architectural catalog No. 19 describing and illustrating its different types of artistic lighting fixtures. A number of illustrations show the actual application of some of the units described. Several photographs show how Guth fixtures are made.

INDUCTION MOTORS.—Bulletin No. 1143 issued by the Allis-Chalmers Manufacturing Company, Milwaukee, describes and illustrates its normal torque, type ARX, line-start induction motors with sleeve or roller bearings.

CLUTCH.—The L. G. S. spring clutch is described and illustrated in a bulletin issued by the L. G. S. Manufacturing Company, Indianapolis, Ind. The bulletin shows varied installations and suggests many practical applications. The three different types of clutch made, the ratchet type, the manual type and the centrifugal type are each illustrated and described.

THREADLESS FITTINGS.—The Erie Malleable Iron Company, Erie, Pa., is distributing its catalog of "Kondu" threadless fittings for 1928. Many additions to the line are offered in this new catalog. A number of illustrations show the application of "Kondu" fittings to various jobs.

STOKERS.—The Detroit Stoker Company, General Motors Building, Detroit, has issued a bulletin which describes and illustrates the Detroit underfeed stoker. The bulletin covers in detail such points as the design and construction, ash discharge, how low maintenance cost is insured, etc. A number of installations are illustrated and described and a series of drawings show the proper application of the stoker to all styles of settings. The company also is distributing a bulletin covering the Detroit self-contained uni-stoker.

LIGHTING DATA.—The Edison Lamp Works of General Electric Company, Harrison, N. J., is distributing bulletins LD 107B and LD 137B entitled "The Mazda Lamp in Projection Service," and "Lighting the Home." A number of illustrations showing installations are included.

## *Forestalling Criticism*

THOSE holding companies whose skirts are clean with regard to the factors which the Federal Trade Commission has been authorized to investigate owe it to themselves and to the industry to make the facts known. If there are others whose record is less creditable, it is to be hoped that the investigation may disclose all of the facts—that such cases may be isolated by the commission, lest the industry as a whole be charged with the shortcomings of the few. In the case of the former, voluntary submission of the data on the subjects of inquiry, through financial statements, the press or other media, will aid the commission in its work and will forestall inconvenience to the companies. It is easier to avoid criticism than to eliminate its consequences.

To illustrate what is meant, one of the holding companies, the Engineers' Public Service Company, intentionally or otherwise, points out in its report that "earnings are derived solely from interest and dividends on securities owned and from incidental interest on the surplus funds." Evidently there are no exorbitant engineering and management fees. Disposing of the possible charge of "pyramiding," the report presents a tabular statement showing that the parent company owns nearly 100 per cent of the common stock of all of its subsidiaries. Furthermore, the purpose behind the formation of this holding company, and the value to the security holders of the system as a whole, are carefully discussed. Similar instances could be presented from the financial statements of other companies.

These are only a few of the points that will be investigated. There are others that could be cleared up in advance by a frank statement.

* * * *

## *Economic Triumph of the Steam-Electric Station*

ALTHOUGH the electric light and power industry realizes in a general way the increasing efficiency that attends its operations, few know intimately the exact measure of that efficiency. The Department of the Interior, however, through the Geological Survey, has for years gathered statistics on the production of electricity and the consumption of fuel by public utility plants, and it is from this government source, in a report dealing with the production of electricity in public utility stations, that the following commendation emanates:

"The improvement in the average utilization of fuels that has been brought about by improvements in plant designs and operation during the last few years continued in 1927. The operators of public utility power plants performed the remarkable feat of generating about two and one-half billion more kilowatt-hours of electricity by the use of fuel in 1927 than in 1926 by the consumption of about 150,000 tons of fuel less than was used in 1926."

Now, this is not an exceptional case. The industry has shown continuous improvement in the use of coal for years. In 1921 it consumed 31,585,000 short tons of coal and produced 26,000,000,000 kilowatt-hours. Last year it produced 50,000,000,000 kilowatt-hours of electrical energy from 41,713,000 short tons of coal. Some of the energy was produced from oil and gas, but the ratio holds. It is significant that in 1919, when 24,000,000,000 kilowatt-hours was generated from fuel, 35,000,000 short tons of coal, 11,000,000 barrels of oil and 21,000,000,000 cubic feet of gas were consumed, whereas in 1927, with more than double the output of electrical energy, 41,000,000 tons of coal, 6,000,000 barrels of oil and 63,000,000,000 cubic feet of gas were employed. That is 6,000,000 tons of coal more, 5,000,000 barrels of oil less and 42,000,000,000 additional cubic feet of gas.

This is a fine tribute to the engineering excellence of public utility enterprises. It indicates why rates are being reduced and reveals also why steam-station production is increasing at a faster rate than hydro production and why interest in water-power development is not so great as it was. Of course, increased efficiency is not always attainable without additional cost, but that is another story. The tale as it stands suffices to show what a conserver of natural resources the electrical industry is, and when translated into social service the accomplishment is almost unbelievable. Yet the facts cannot be denied.

* * * *

## *Electrical Engineers and the Span of Life*

BEFORE 1928 was six weeks old the American electrical fraternity was called upon to mourn the passing of two of its distinguished engineers—Elmer E. F. Creighton of the General Electric Company and William C. L. Eglin of the Philadelphia Electric Company. Mr. Creighton was 55. Mr. Eglin was 57. Their failure to attain the 70 years that by scriptural prescription every mortal thinks of as the lowest limit of his sojourn on earth suggests a comparison of their ages with those of other widely known American electrical engineers who have died so recently that their memories are still green.

A reference to the longer obituary articles in the ELECTRICAL WORLD's files for 1923-1927 shows ten written to commemorate either engineers or company executives with a broad engineering background. Of these the only man coming within hailing point of 70 was John A. Britton, who died at 68. Carl Hering was 66, Henry M. Byllesby 65 and Schuyler S. Wheeler 63. Benjamin G. Lamme reached three score. Of the others Charles P. Steinmetz and Louis Bell were 58, Ernest F. Nichols 55, John L. Harper 51 and Milan R. Bump 44. The twelve men occupied divergent fields. Britton, Byllesby and Wheeler were respectively heads of an operating, a holding and a manufacturing company; Hering and Bell were consulting engineers;

Lamme, Steinmetz and Creighton were in the employ of great manufacturing companies; Nichols was a physicist, for most of his life a technician and educator rather than a practitioner; Eglin and Harper were chief engineers of power companies, and Bump was a holding-company engineer-executive. But they were alike in that they all died too soon—their careers cut short in the full tide of achievement and probably before thought of retirement had entered the mind of any one of them.

Is there not something a little disquieting in their comparatively short lives, averaging 58 years? A more inclusive list of eminent members of the fraternity recently departed, taking in men like Joseph B. McCall, 56, and Guy E. Tripp, 62, would probably raise the average very little, if at all—though it is true that Charles R. Huntley reached 73 and Charles A. Coffin 81. Does this lack of longevity point the old moral of overwork and neglect of health and, therefore, fall in the category of preventable—though, alas! too seldom prevented—disasters? Or is electrical engineering one of those callings where to win great success all save a few must reconcile themselves to shortened life? Fortunately for the dissipation of gloomy thoughts, there are still living among us men high up in this profession who have passed three score and ten and a few of whom tread hard on the heels of the youthful veteran of Menlo Park, now headed for 90.

* * * *

## *Executive Indifference a Barrier to Selling*

IN SO FAR as the power industry is concerned, the biggest immediate problem in market development is not what can be done with the public, but what can be done with the executive. How can he be interested in commercial policy? How can he be brought into intimate touch with sales problems and sales plans?

No matter what we think, the public is not vitally interested in things electrical at this moment. The ordinary family feels that it must have electric light. It is standard for the modern home. The other uses of electricity are looked upon as appealing but not essential. Otherwise ten million wired homes would not be today without vacuum cleaners, for example, while seven million have them—to approximate the figure. Otherwise more than 3 per cent of wired homes would use electric ranges. But all that can be corrected by selling. For the same commercial enterprise that has popularized the phonograph, the radio, the camera and the automobile will popularize electrical appliances in the same homes. The kind of selling that has put over the good roads idea will put over good street lighting. The kind of marketing that has established the cash register and the time clock in universal use will build a universal market for electrical equipment in the store and in the factory.

When it comes to selling to the executives of the power industry themselves the idea that market building must be organized today on this broad scale and bulwarked with real leadership and financing, the task is harder. For these executives almost to a man are thinking as engineers, as operators, as financiers. They are not interested in commercial policy. They feel no enthusiasm for selling. They see the romance in a turbine, but not in a merchandising campaign, a load-building program. And that, to a very large extent, is what's the matter with the commercial end of the power industry. If the building of the market were receiving the high executive support—the planning, the direction and the leadership—that goes into the building of the transmission system and the development of the financial structure, the electrical industry would have as proud a record for its selling as for its technical achievements. And, after all, it is through selling that the true public service comes, for it is selling that introduces the uses of electricity into the lives and the work of the people.

* * * *

## *Price Courage as a Responsibility*

PRICE cutting is under very active discussion at the moment. There are two viewpoints. The purchasing agent is charged with taking unfair advantage of the manufacturer in this buyers' market and doing injury to the industry by beating down price levels and demoralizing values. The manufacturer is criticised for voluntary and precipitate price cutting impelled by eagerness for orders. Not all purchasing agents are indicated, of course, and not all manufacturers. But there is evidence enough to make the picture a distressing one, despite a vigorous defense by the buyer, that this is just the good old battle between the forces of supply and demand.

It is interesting to note, however, that there is one feature of the argument in which both sides are in accord. Manufacturers as well as purchasers agree that the power of "yes or no" lies in the hands of the seller. His ability to use it depends upon his courage. And there is no substitute for courage. But price courage is largely a matter of organization. For the most courageous salesman is apt to be the one who has the most courageous boss. And the company with the strongest price policy is usually headed by an executive who in a pinching market would rather sacrifice volume and loss in idle capacity than cut prices and compromise the principle that goods should not be sold at a loss. It is easy to talk about price courage. It is hard to battle in the marketplace. But price cutting is contagious. It is infectious. The manufacturer cannot escape his responsibility both to protect himself and to defend the economic soundness of values. There cannot be too much discussion on this point.

* * * *

## *Interpret the Facts*

UNDER stress of acute competition for industrial heating business, power sales engineers sometimes hesitate to make public the kilowatt-hour requirements of particular processes per unit of product, fearing that the data will be seized upon by representatives of gas or oil-burning apparatus and used against electricity in economic comparisons. On a B.t.u. basis electricity may not in certain cases show economies over combustible fuels, but its advantages in other ways may suffice to win the decision from the intelligent purchaser. The only safe way to meet this condition is to bring out the facts and to evaluate them as applied to each case in hand. Gas or oil may hold the trump cards in one case, electricity in another, and an all-around analysis of the costs and benefits of the different competitive methods is essential to a sound determination of what to use. An open-minded purchaser will allow certain points in favor of the quality repetition, improved working conditions, accurate control and flexibility of electric heating if the sales engineer knows how to present these claims. Many times the scales have turned toward electricity in negotiations where a bare fuel comparison showed lower outlays for other agencies, because of these real, if at times intangible, advantages. Excessive caution defeats its own ends in this field as in many others.

## *Insulation at a Price*

SERVICE standards are very high in the electrical industry, and often the cost of maintaining these high standards is enormous. The whole problem of system insulation is now largely a matter of fixing standards of service in terms of the cost of insulation. Much talk about ground wires, arcing rings, protection of terminal apparatus and other elements of utility systems deals with the necessity of spending money for insulation.

On transmission lines agreement is now had that ground wires are splendid assets to service continuity if properly installed and if low-resistance grounds are permanent along the lines. But they cost money. Whether to use arcing rings or a larger number of insulator units is also largely a matter of dollars. For example, a string of fifteen suspension units with arcing rings is about equivalent to eighteen suspension units without arcing rings under impact tests. To determine which to use involves a balance of the first costs of insulators, arcing rings and relays and an evaluation of the fact that possibly more insulators must be replaced and more maintenance will be required if no arcing rings are used. The relative erecting costs must also be considered. No general statement should be made and no experience on any one system can be taken as proof that the same experience will be had in other localities. After the balance sheet is made judgment based on local conditions and service standards must award the decision.

Then, again, if a line is made immune from flashover, it becomes necessary to protect the terminal station equipments. Added equipment insulation, caging of lines for some distance from the station, use of fused horn gaps, graded line insulation, arresters, special relay installations and many other methods may be used individually or in combination. What to do is largely a matter of service standards and costs to obtain these standards.

## *Improvements in Turbo-Generators and Speculations Upon Them*

SUCH a record of improvements as that presented by S. L. Henderson and C. R. Soderberg at the winter convention of the A.I.E.E. indicates that designers and manufacturers of turbo-generators at least are giving sympathetic consideration to the major requirements of users and seem to have the solution of problems well in hand despite the rapid increases in rating demanded. Ventilation no longer appears to be a limitation, and hydrogen cooling may become an actuality if the units now designed therefor are so operated. Coil insulation is being so made and protected against corona that coils designed for 22,000-volt operation have withstood momentary tests of 160,000 volts. Objections to the use of silicon-steel laminations have been circumvented so that core losses have been reduced considerably. Short-circuit ratios are being held to values that avoid instability of operation. Use of structural-steel frameworks is simplifying the shipping of large units, but the weight of rotors is still a limiting factor.

If the attention being given to centrifugal, bending, longitudinal and torque stresses in the turbo-units under operating conditions is any indication of the study being devoted to vibration problems in turbine blades, it may be hoped that even these elements will give very infrequent trouble. Studies of resonance frequencies indicate that there may be more than one critical speed, that flexibility of bearings has an influence, and that the problem is now to design units so that under normal variations their speed will remain within the valleys of resonance curves.

Speculation regarding some problems suggests possible value in the investigation of such subjects as: (1) the feasibility of annealed vitreous coil insulation; (2) semi-conducting slot liners that can be maintained in close contact with the insulation to prevent corona; (3) circulation of water, oil or a refrigerant through piping threading the stator laminations for increased cooling effect; (4) space economy, improved vacuum and capital saving of refrigerant-cooled condensers, and (5) the relationship between the natural vibration of turbine blades and the product of the r.p.m. and number of stationary vanes in the corresponding diaphragms.

Now that a generator voltage of 22,000 is considered quite conservative, possibly more users will take advantage of the economies in circuit breakers, switches, bus-bars, etc., made possible by utilizing higher generator voltages. As pointed out by Mr. Henderson, it is not desirable to call for a high short-circuit ratio, because it will limit the rating of a given-size generator and increase the cost per kilowatt.

## *When Will the Electrical Industry Talk to Its Public?*

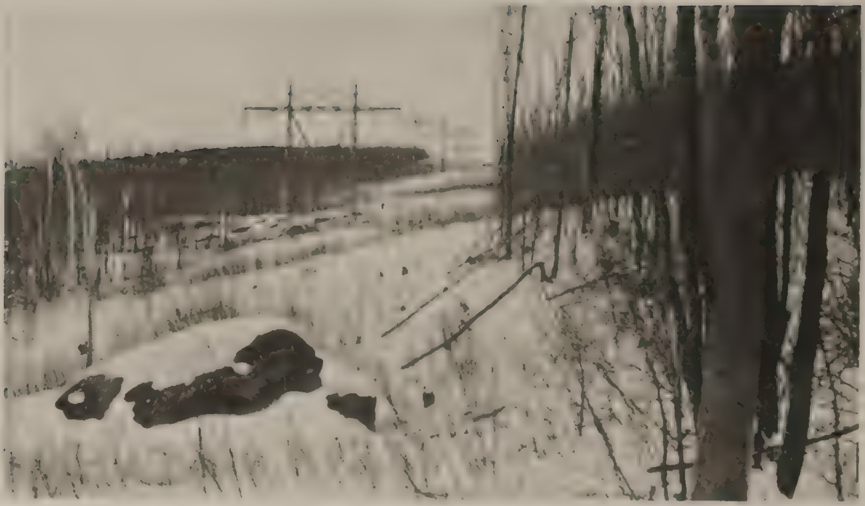
"ADVERTISING is the principal means whereby business talks to its public." That is about as accurate a definition of advertising as has been made. The electric power industry of this country should adopt this means of talking plainly to its public. It has tried whispering in back rooms; it has tried speech making from platforms; it has tried many methods of propaganda; it has done some advertising in fits and starts. It has never, as an industry, tried plain, honest, continuous, forthright advertising—such as has won and held popular attention and interest for certain other products and industries.

The central-station companies are "due" to try advertising in this way as a means of talking to the public. They will make a terrible mess of it at first, no doubt, but they are too intelligent to do it badly for long. They will buy straight-in-line advertising brains. They will hire the educated pencils of keen-visioned copy men, the deft fingers and vivid palettes of capable commercial artists, the finely balanced skill of expert typographers. Advertising, they will find, is no harder to produce than electrical energy. They will make a success of it. The unsettled and unsettling question is—when?

* * * *

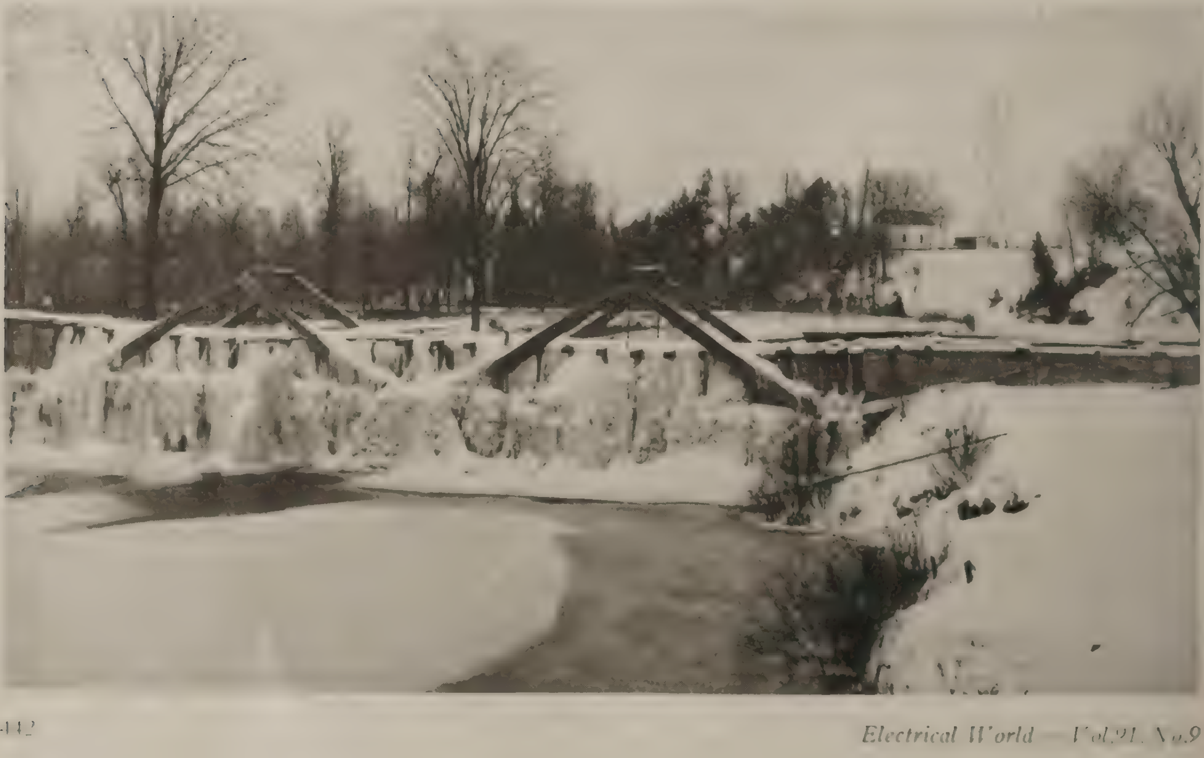
## *Vertical Distribution a Possibility*

IN THE skyscraper areas of large cities it may be economical and convenient to institute vertical distribution of electricity. The number of floors and the load per floor makes the cost of copper and of regulation a very large item when low-voltage distribution from street levels is used. In future developments high-tension cables set in concrete rising from the bottom to the top of the tall buildings may be used. Feeders at the top and bottom of the buildings could be used, and at each floor a transformer station could be located for service applications. For some areas such a plan would seem well worth study by the industry.



# Fighting Winter With Strategy

LOW towers and short spans are used by the New England Power Company for its 66-kv. line at the summit of Florida Mountain on the Mohawk Trail, to gain shelter from storms. The 120-kv. line of the Rochester Gas & Electric Company at Yates Crossing, near Rochester, N. Y., rises high above the winter-bound levels.



# Tests of Arrester Grounds

Emphasize necessity of initially and periodically measuring resistance of ground electrodes. The effects of multiple grounds, spacing, soil conditions and treating soil with various salts. Permanency and corrosive test methods

By Edward Beck

*Supply Engineer Westinghouse Electric & Manufacturing Company*

LIGHTNING arresters cannot reduce transient voltages to a value that will not harm protected apparatus if hampered by high ground resistance. The degree to which ground resistance interferes with the performance of an arrester is apparent from one of the accompanying curves relating to a 3,000-volt auto-valve unit subjected to a 70-kv. (crest) surge. With zero ground resistance, the protection obtained was good, the surge voltage being reduced to approximately 10 kv. (crest). With a ground resistance of 50 ohms in the arrester circuit, the voltage from line to earth was doubled. Under similar conditions a transformer on a 2,300-volt line might be expected to fail.

The importance of low-resistance grounds cannot be overemphasized. Too little attention has been given to this phase of the protection problem. If it is intended to protect an electrical system against lightning and if money is to be expended for lightning arresters, it is worth while to add slightly to this expense for the purpose of not only making but also maintaining adequate grounds. This extra effort will repay itself in the ensuing reduction of lightning troubles.

Except where the conductivity of the soil is very poor, driven grounds consisting of pipes or rods forced into the earth give satisfactory resistances, are the easiest to install and consequently are desirable. Where one driven electrode does not furnish a ground of low enough resistance, multiple grounds may be made easily. If further reduction in resistance is necessary, treatment of the soil with a salt must be resorted to.

### INFORMATION SOUGHT

Although many data have been collected by other investigators, there appears to be a lack of comparative information on the characteristics of the different types of driven grounds commonly applied to lightning arresters. Consequently an investigation was undertaken with the purpose of securing answers to the following questions:

1. What reduction in resistance may be obtained by the use of suitable multiple electrode grounds?
2. What reduction is realized by applying various salts to the earth adjacent to the electrodes?
3. How quickly after applying the salts are these effects obtained?
4. How long may the effect be expected to last?
5. What is the corrosive influence of these salts on the materials generally used for electrodes?
6. To summarize, what type of ground is the most economical to use?

This investigation was made entirely on driven grounds; other conditions requiring different types are considered special. However, the data here presented may be applied to any type of ground electrode. The experimental installation of ground electrodes was made near broadcasting station K D K A, in East Pittsburgh, in June, 1926. It is intended to observe these grounds for several years.

Although it is too early to make any observations on the degree of corrosion caused by different salts on the different materials used for electrodes and too early to determine the length of time that the effects of salting the earth may last, observation to date may be of interest. The complete program calls for further observations on these electrodes to determine when the effect of the salts will disappear and removal of the electrodes at the end of three or four years to examine them for corrosion.

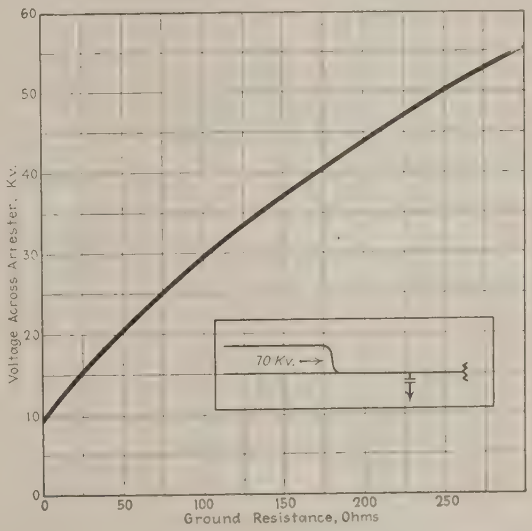


*Fig. 1—Effect of ground resistance on performance of 3,000-volt type LV auto-valve lightning arrester*

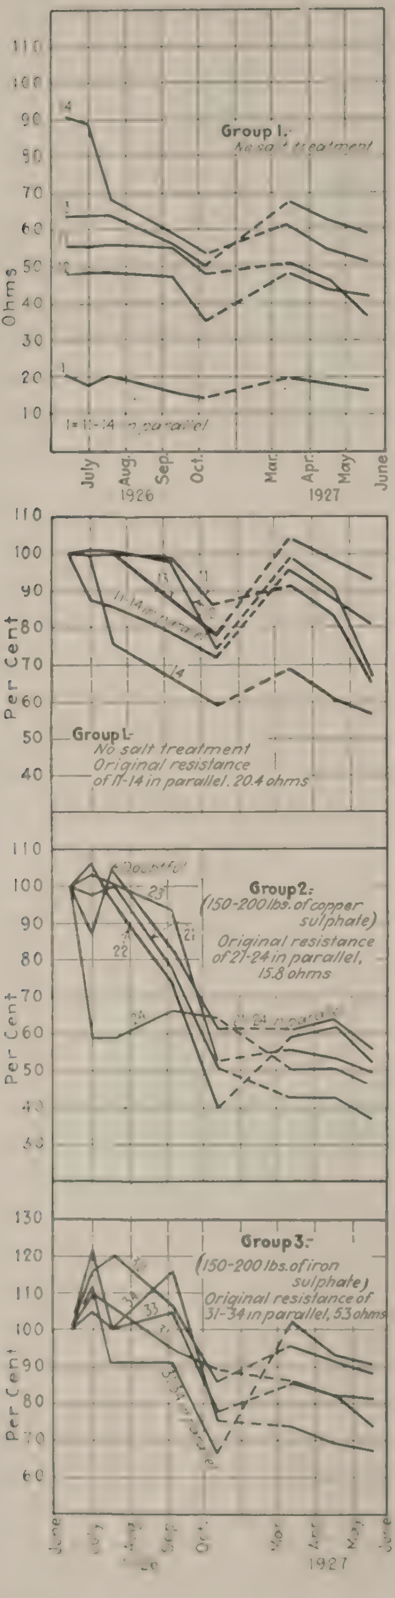
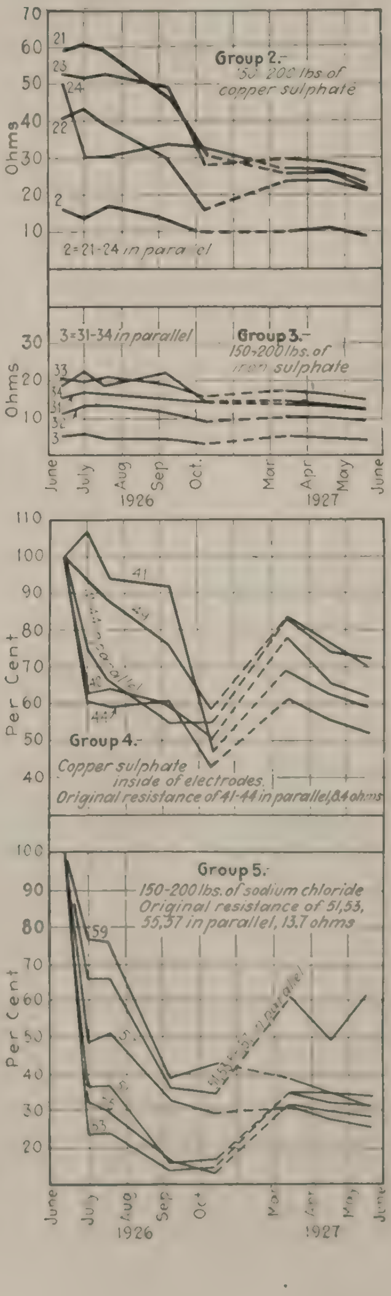
The curve was derived by means of DuFour oscillograph with arrester at transformer at end of line and subjected to a 70-kv. (crest) surge. Excluding direct strokes, it was considered that this would be the maximum surge that might be expected on a 2,300-volt line.

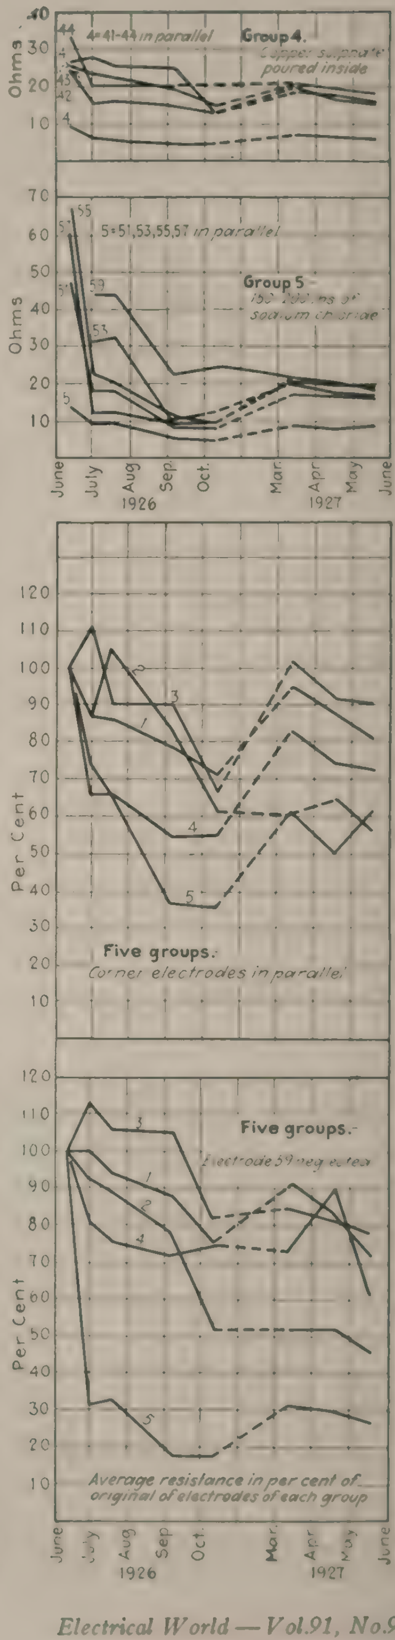
It was endeavored to make the installation typical of good practice in lightning arrester grounds. Numerous facts about grounds have been determined by other investigators. For instance, we know that the diameter of electrodes which can be driven and the material of which they consist have a negligible effect on the resistance, that increasing the depth of driving beyond 6 ft.

*Fig. 2—Variations in Resistance of 31 Ground Electrodes Over Period of Year*

The several groups whose resistances are indicated in ohms and percentage of original values in the accompanying figures consisted of galvanized and plain iron pipes and copper weld rods of various numbers sunk in treated soil. The adopted materials were: Group 1, plain ground; group 2, copper sulphate; group 3, iron sulphate; group 4, copper sulphate inside of pipes, and group 5, rock salt. See Fig. 3, page 445.







is of little benefit except in very dry localities, that the minimum spacing between multiple electrodes should be 6 ft., and that salt, if used, should be applied liberally if an appreciable reduction in the ground resistance is to be secured.

Bearing these things in mind, five groups of electrodes were installed as illustrated. The plain iron pipes external to the square formed by the other electrodes were driven to observe the corrosive effect only, resistance measurements being confined to the others. Group 5 consists of nine electrodes, to permit observation of the effect of electrodes at reduced spacings and of increasing the number of electrodes in a given area.

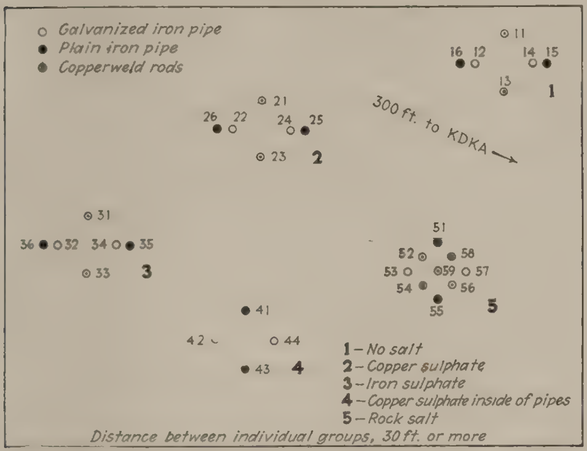


*Fig. 3—Five groupings of ground electrodes were tested under different conditions*

Nature of soil, yellow clay interspersed with shale; rainfall, averages 36 in. per year; location, top of hill, sloping off from group 1 toward 3 and 4 by about 10 ft.; diameter of pipes, 2 in., of rods, 1 in.; spacing between corner pipes, 6 ft., external iron pipes 2 ft. from corners; depth to which driven, 8 to 9 ft.; salts applied to groups 2, 3 and 5 by pouring into a shallow trench surrounding the electrode square.

Group 1, two galvanized iron pipes, two copper-weld rods and two plain iron pipes, no salt, located on the highest elevation; group 2, two galvanized iron pipes, two copper-weld rods, two plain iron pipes, 150 to 200 lb. of copper sulphate; group 3, two galvanized iron pipes, two copper-weld rods, two plain iron pipes, 150 to 200 lb. of iron sulphate. Located in slight depression; group 4, four galvanized and two plain iron pipes, with numerous holes drilled in them, copper sulphate solution poured inside of pipes; group 5, two galvanized iron pipes, two plain iron pipes, five copper-weld rods, 150 to 200 lb. of rock salt (sodium chloride).

As it is impracticable to use coke with driven grounds, the treatment of the soil surrounding the grounds was confined to the application of salts. Those most commonly employed are rock salt and copper sulphate; therefore these were used. A group using iron sulphate was added because this substance is cheap and has about the same conductivity in solution as copper sulphate. It is therefore worthy of consideration as a remedy for high resistance.

The arrangement of four electrodes in a square was chosen because this would be suitable for a multiple lightning arrester ground and furnish data on multiple grounds where the resistance of one electrode alone is too high. The resistances of the electrodes comprising corners of the squares were measured individually and in multiple about once a month except during the winter. No measurements were made during the winter for several reasons. One reason is that thunderstorms are rare when the weather is cold, hence there is no interest attached to the resistances in winter; also the behavior of ground resistances during the time the ground is frozen is well known. (See reference 1 in bibliography, page 447.)

Resistance measurements were made by means of the alternating-current volt-ampere method, using the ground of KDKA as a return. The broadcasting ground was checked occasionally by the three-point method. It was found to be quite constant between 0.3 and 0.4 ohm. It consists of a network of copper strap buried in coke and paralleled with the water-pipe system.

A small two-winding transformer was used to furnish the measuring current. This transformer was equipped with several voltage taps on the secondary. The apparatus is portable (weighing about 50 lb., including meters) and can be carried by one man. The primary is fed through a long cable, kept on a reel, from the 110-volt circuits of KDKA. Currents of the order of 5 to 15 amp. were used for measuring where possible. Checks on the same grounds were made, using currents of the order of 100 milliamperes. No marked deviation from the measurements at higher currents was found. Sometimes the indication was 5 to 10 per cent greater with the small currents. Apparently current strengths varying over a considerable range have no effect on the resistance. That this is so is further demonstrated by the accompanying volt-ampere characteristic made of a column of soil under pressure by means of the DuFour cathode ray oscillograph.

In the author's opinion, there is no apparent reason why the behavior of a low-resistance ground carrying a heavy current should be different from that of a high-resistance ground carrying a small current. It was found impracticable to set up a circuit consisting of earth in the laboratory with low enough resistance to permit the flow of currents of the magnitude of those caused by lightning. It is hoped to obtain such data in the field this summer. However, the maximum current it is practicable to use for measuring ground resistance is not much more than 20 amp., so that from the standpoint of measuring, the soil volt-ampere characteristic is of value. From the foregoing it seems safe to expect a reasonable accuracy if portable instruments of the bridge or ohmmeter types are used to measure lightning arrester grounds, provided they make use of alternating measuring current, although these instruments generate only small currents.

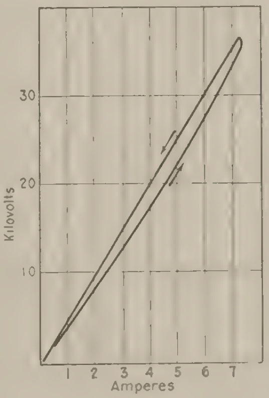

FIG. 4—VOLT-AMPERE CHARACTERISTICS OF 2¼x6-IN. COLUMN OF DAMP SOIL SHOW THAT CURRENT HAS LITTLE EFFECT ON RESISTANCE

Voltage impressed by condenser discharge simulating lightning transient. Resistance calculated from oscillogram was 4,900 ohms; at 110 volts, 60 cycles, 5,000 ohms. Since maximum current was only 8 amp., the results shed no light on behavior of ground electrodes under heavy surge currents.

The variations in resistances of the individual grounds observed during about a year are depicted. The first measurements were made the day after the electrodes were installed; therefore the salts applied to them had not taken effect. The salts began to lower the resistances not long afterward. The measurements indicate that the resistances of the installations treated with common rock salt decrease more rapidly and reach a lower value than those treated with either copper or iron sulphate. (See particularly Fig. 2, "Five groups.") To ascertain whether this conclusion is reasonable, the solubilities of the salts used and the electrical conductivities of their solutions were examined. Their characteristics are illustrated. From these curves it may be seen that common salt is more soluble than either of the two others; also that the conductivity of its solution is about five times that of theirs. It is therefore to be expected that treatment with common salt will produce a lower ground resistance in less time than treatment with other salts. That a reduction in resistance is effected by the salt is shown by the action of the various electrodes in group 5, Fig. 2, page 444. The resistances of the outer electrodes of this group (Nos. 51 to 58) decrease very soon after the application of the salt, whereas the resistance of the center rod (No. 59) remained high for some time and then decreased more slowly, ultimately reaching almost the same value of resistance as the other rods. This occurred because some time elapsed before the salt solution permeated from the outside of the group to the center rod.

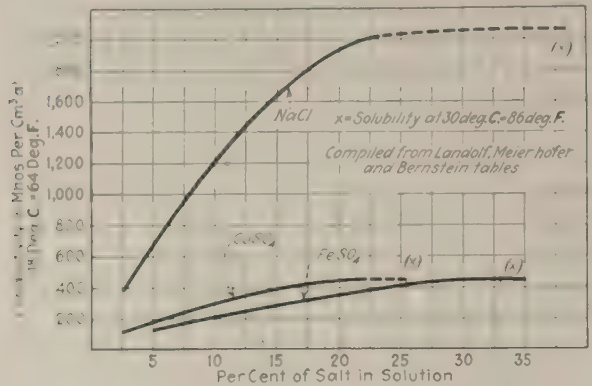

FIG. 5—COMPARATIVE CONDUCTIVITIES OF SALT SOLUTIONS

It was felt that the results of measurements on one group of electrodes did not present conclusive proof of the electrical superiority of rock salt. It was suspected that the progress of the resistances might, in a measure, be due to the character of the soil at that particular location. Consequently in the spring of 1927 a second set of electrode groups was installed in the same locality, removed about 150 ft. from those already driven. This second installation practically duplicated the first except that, to simplify the installation, copper-coated steel rods were used in all but one installation, in which it was desired to observe the effect of pouring salt solution inside of the electrodes. This installation consisted of only four electrodes per group, as it is felt that the data on corrosion could be obtained with the original installation. The rods were 8 ft. apart instead of 6 ft., in order to observe whether there is any material benefit attached to this increased spacing. The results of the measurements to date on the second installation are presented in Fig. 6.

Unfortunately for the comparison, the resistances of the electrodes of the second installation were all much lower than those of the first. However, the graphs again indicate the rapid fall in resistance of those electrodes treated with common rock salt.

The differences in initial resistances of various groups in the first and second installations are interesting because they show the wide divergence that may be expected in comparatively small areas of ground. This emphasizes the need of measuring the resistance of all grounds made in order to determine their value. It is not sufficient to drive an electrode 10 ft. deep and assume therefore that a good ground has been made. It was found, in general, that those electrodes which were driven with the least effort had the lowest resistance. In some cases it was impossible to install the electrodes without first digging a hole. Those electrodes which pass through shale generally had a high resistance. For instance, electrode 14 required much effort to sink it to the required depth, as it was necessary to penetrate considerable shale. Its initial resistance was 90 ohms. As time went on and the earth became well packed around the electrode, its resistance decreased. The rods of group 3 were fairly easy to install; moreover, they are located in a slight hollow where moisture probably gathers; consequently they initially had between 11 and 20 ohms resistance. The electrodes of group 6 are driven close by a tiny stream; their resistances are low, yet not appreciably lower than those of other groups of the second installation.

The reduction in resistance which salting causes in the case of the electrodes which are initially low is apparently much less than that obtained on electrodes which are initially high. It appears that the resistances of electrodes of a salted group gradually fall to about the same value. This is probably so because the salted region of the earth acts like one large electrode for which the driven rods or pipes are terminal posts.

## EFFECTS OF PARALLELING AND SPACING

If the measured resistances of rods in parallel are compared with values calculated from the resistances of the individual rods, it is found that the ratio of the actual to the calculated is of the order of 1.5 to 1.7 except where the resistances are high, in which case the ratio may be nearer to 1. For instance, the measured resistance of the four electrodes of each group in multiple were compared with the theoretical resistance calculated by the formula $\frac{1}{R} = \frac{1}{r_1} + \frac{1}{r_2} \ldots + \frac{1}{r_n}$ The results are given in the accompanying table. .

It appears that the gain in paralleling electrodes is less where the soil resistance is low than where it is high.

Measurements made on the nine electrodes of group 5 for the purpose of checking the benefits of driving electrodes at close spacings or of adding electrodes in a given space gave the results also shown in the table. These measurements were made at the beginning of the

MEASURED RESISTANCE COMPARED WITH THEORETICAL (OHMS)

| Group | Calculated | Measured | Ratio (*M* + ' ) |
|---|---|---|---|
| 1 | 13.9 | 19.5 | 1.40 |
| 2 | 6.7 | 9.6 | 1.43 |
| 3 | 3.4 | 5.4 | 1.59 |
| 4 | 5.0 | 7.0 | 1.40 |
| 5 | 4.8 | 8.4 | 1.75 |
| 6 | 2.0 | 3.3 | 1.65 |
| 7 | 1.7 | 3.0 | 1.77 |
| 8 | 2.9 | 5.0 | 1.73 |
| 9 | 3.3 | 5.9 | 1.79 |
| 10 | 2.5 | 4.7 | 1.88 |

| | Electrodes in Parallel | Resistance (Ohms) Measured | Calculated | Ratio (*M* + *C*) |
|---|---|---|---|---|
| (1) | 51, 53, 55, 57 | 14.0 | 14.1 | 1.0 |
| (2) | 51, 53, 55, 57, 59 | 13.6 | 10.3 | 1.3 |
| (3) | 51 to 58 | 12.9 | 7.2 | 1.8 |
| (4) | 56, 57, 58, 59 | 22.3 | 14.3 | 1.6 |

Ratio of (4) to (1)—that is, 3-ft. to 6-ft. spacing—is 1.6.

investigation. The resistances of the individual electrodes of group 5 varied between 47 and 67 ohms.

These tabulations indicate that closer spacings than 6 ft. are not to be recommended, that increasing the spacing beyond 6 ft. is not worth the trouble and that additional rods in a 6-ft. square are not economical.

## CONCLUSIONS

It is too early to draw definite conclusions regarding the ultimate superiority of a certain salt or a certain electrode material, as the degree of corrosion and the duration of the salting effect cannot be evaluated at this time. Therefore the questions propounded earlier in this article cannot all be definitely answered.

The reductions in resistance that can be obtained by using parallel grounds and by salting are shown.

The question of how quickly the salts take effect may be answered by the statement that in the case of rock salt an appreciable reduction may be realized in about two weeks, but a longer time must elapse in the case of other salts unless the solution is poured around the electrodes, as was done in group 4. The time necessary for the salts to become effective undoubtedly depends on the nature of the soil, and the results obtained at East Pittsburgh may not apply to other localities.

How long the effect lasts has not yet been determined; it appears that it will last at least a year, however.

The most economical ground to use is still undetermined, because the lasting effect of salting and the corrosive effect are not definitely known. Prof. O. B. Wooten (see reference 2 in bibliography) has stated that pipes imbedded in soil treated with rock salt show little corrosion after two years.

From the electrical standpoint, rock salt is the most efficacious in reducing the resistance of driven electrodes. From the first cost standpoint, it also has the advantage over copper sulphate. The costs of the salt used in carload lots at Pittsburgh are as follows per 100 lb.: Copper sulphate, $4.30; iron sulphate, $1.40; rock salt, $1.95.

From the standpoint of ease of installation, the rods possess a distinct advantage. Pipes require driving points and caps and must in general be larger in diameter than rods of equivalent mechanical strength; therefore they require additional effort to drive them.

Treating the soil by pouring electrolyte inside of pipe electrodes that have been drilled with numerous holes apparently possesses certain advantages, as the electrolyte takes effect quickly and it is simple to repeat the treatment. The cost of such an installation is higher. It is doubtful whether the advantages derived outweigh the increase in cost.

No attempt has been made to discuss methods of making earth connections in unfavorable soils. Grounds of that character require special methods, usually costly.

There is one point which the author wishes to stress emphatically. It is that measurement of the resistance of grounds is essentially from the protective and the economic standpoints. If one electrode provides a sufficiently low resistance, it is patently uneconomical to drive more or to salt the earth. Moreover, it is only by measuring the resistance of the ground when it is installed that the necessity for additional electrodes or salting becomes apparent.

Regarding the frequency with which the resistances should be checked, it appears from the data here collected that once a year is sufficient; perhaps the interval may safely be longer. The measurement should preferably be made in April or May. It is to be recommended that in addition to measuring each ground when it is installed, a second test be made about two weeks later.

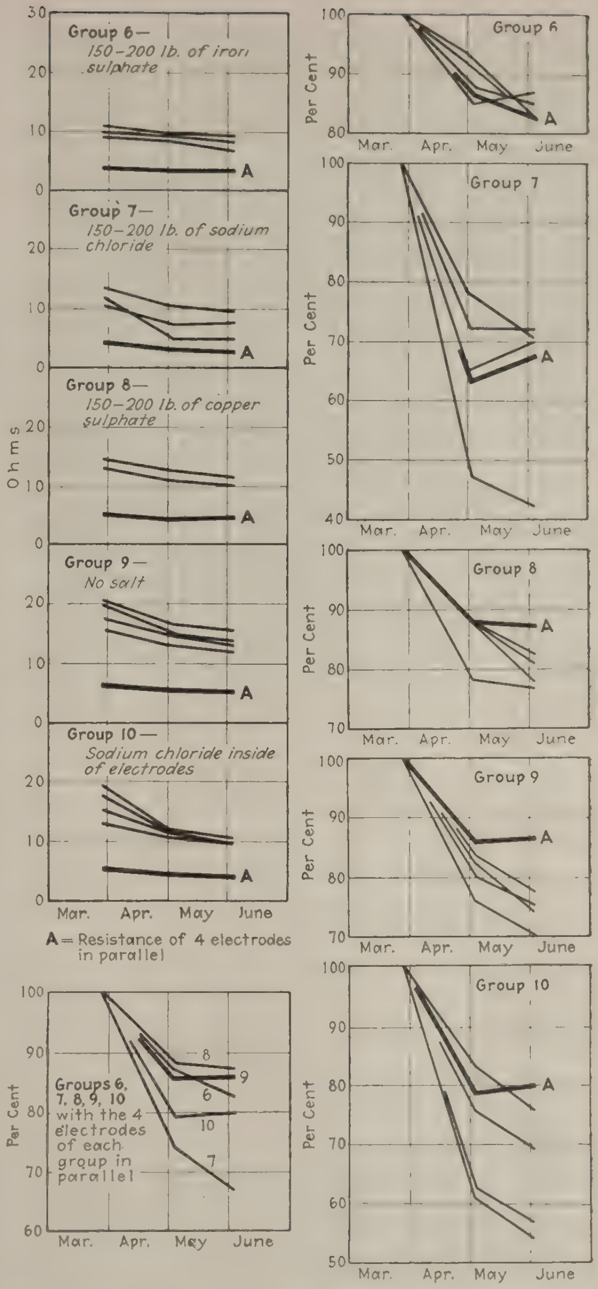

FIG. 6—RESISTANCE OF FIVE GROUPS OF ELECTRODES USING COPPER-COATED STEEL RODS SPACED 8 FT. INSTEAD OF 6 FT.

The author wishes to take this opportunity to express to R. M. Keller, J. B. Leinbach and O. Ackerman his appreciation of their co-operation in conducting this investigation.

# Reducing Distribution Losses

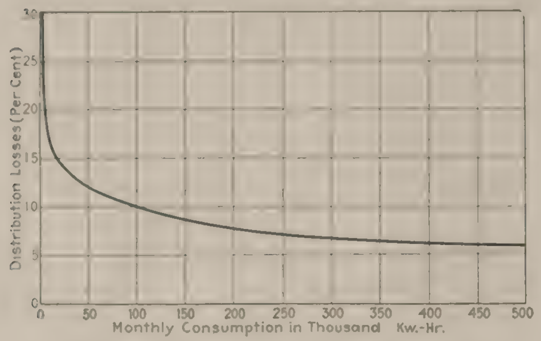
TENTH ARTICLE

## *Results Obtained on One System*

By J. B. Moorhouse
*Electric Distribution Engineer Central Illinois Public Service Company, Springfield, Ill.*

THE economical operation of an electric utility requires consideration of all factors involving operating expense. Where greatest savings may be made the greatest effort should be expended to produce that saving. Power stations have received their share of attention in improvement of design and methods of operation with most gratifying results. As indicated in the previous articles of this series transmission and distribution systems offer a field for further development in reducing losses and improving service and concrete evidence is offered in this the final installment.

The amount of money which may be spent in investigating losses and for reconstruction purposes depends upon the amount which can be saved by the improved system. It is evident that the return on a town of 300 average customers will not warrant the expense of a detailed survey for loss reduction. Cities of 5,000 population and above which have high unaccounted for losses justify the cost of a detailed survey to the extent of using graphic instruments where needed.



DISTRIBUTION LOSSES EXPRESSED AS A FUNCTION OF ENERGY CONSUMPTION

The trend of loss reductions of thirteen towns in the territory served by the Central Illinois Public Service Company is shown in the table. The tabulation is prepared from monthly loss reports over a period of nineteen months. It may be observed that the losses in these towns are approaching values indicated in the accompanying curve. The greatest savings were realized in towns "C" and "I," the least in towns "B," "K," "H" and "M," indicating there was little relationship between community consumption and potential loss reductions. Town "F" of the above list had poorly located distribution transformers of excess capacity. When reconstruction was carried on 84 kva. was removed from the town, leaving 202 kva., yet service was greatly improved. Town "J" is in a coal mining district where it is difficult to plan overhead construction due to the variation in number of customers. Town "L" is located in a flood area; emergency use of unmetered electrical energy raises the loss percentage above normal. Service in town "M" is furnished to several canning companies, whose power load is heavy for a few weeks only. Service to these companies is transferred from small transformer banks to large banks during the canning season, thereby minimizing transformer losses. The variety of conditions encountered makes it necessary for the distribution man to familiarize himself with local conditions before making recommendations for reconstruction.

TABLE OF LOSS REDUCTIONS

| Town | Kw.-Hr. Per Year Supplied to Distribution System | Per Cent Loss Before Survey | Per Cent Loss After Survey and Reconstruction |
|---|---|---|---|
| A | 110,000 | 45 | 39 |
| B | 156,000 | 26 | 24 |
| C | 216,000 | 45 | 22 |
| D | 252,000 | 25 | 14 |
| E | 252,000 | 27 | 19 |
| F | 264,000 | 22 | 16 |
| G | 276,000 | 27 | 18 |
| H | 516,000 | 24 | 19 |
| I | 1,020,000 | 38 | 17 |
| J | 1,080,000 | 27 | 19 |
| K | 1,680,000 | 18 | 14 |
| L | 2,640,000 | 21 | 14 |
| M | 4,245,000 | 10 | 5 |

# Net Cost of Condensing-Water Conduits

IN THE accompanying table are given the estimated installed costs of various condensing-water conduits, exclusive of overhead charges during construction such as organization, engineering, interest, etc., derived from a reproduction cost appraisal of an Eastern central station located on tidewater after a comprehensive survey of the property. Included in these data are also a group of similar net costs taken from the company's field sheets in connection with an extension made during 1925. All data presented, unless otherwise indicated, are based on 1927 figures.

MISCELLANEOUS NET COST DATA FOR CONDENSING-WATER TUNNELS (NO OVERHEAD)

| | |
|---|---|
| Intake tunnel, 322 ft. long, circular brick, inside diameter 6 ft. 6 in., walls 12 in. thick | $36,788 |
| Intake tunnel, 94 ft. long, other dimensions as above, brick | 9,336 |
| Discharge tunnel, 186 ft. long, reinforced concrete, inside dimensions 4 ft. x 5 ft., walls 8 in. and 16 in. thick, roof slab 12 in. thick, inside face of side walls waterproofed with felt and pitch, with 4-in. brick protection course | 5,196 |
| Discharge tunnel, 87 ft. long, reinforced concrete, 4 ft. x 5 ft. inside dimensions, wall 3 in. thick on one side and 16 in. thick on other, roof slab 12 in. thick, waterproofed as above | 2,354 |
| (For contractor's compensation add 5 per cent to above) | |
| **Intake Screens** | |
| Two Link Belt vertical intake screening elevators, 25 ft. 6 in. on centers; 5 ft. 6 in. screening panels of No. 9 BWG 1-in. square mesh screen cloth with steel framework; No. 4103 malleable iron closed joint pintle chain driving machinery, splash plate guards, spray pipes, valves and connections, driven by and including 5-hp., 550-volt, three-phase, 60-cycle motor with reduction gear and including steel framework for hoisting trash racks | 7,644 |
| (For contractor's compensation, add 5 per cent to above) | |
| **1925 Field Costs (net, no overhead)** | |
| Intake and discharge tunnels, each reinforced concrete with 18-in. walls, floor and roof slabs.<br>Intake, 463 ft. long with 7 ft. x 7 ft. inside dimensions and 86 ft. length of sizes ranging from 6 ft. x 6 ft. to 6 ft. x 7 ft., with manholes and gate wells<br>Discharge, 143 ft. of 4 ft. x 7 ft. inside, 60 ft. about 5 ft. 6 in. x 8 ft. 6 in., 340 ft. about 5 ft. 6 in. x 12 ft., 10 ft. of 4 ft. 6 in. x 7 ft., and manholes and connections | 241,937 |
| Screen house substructure and well, 32 ft. 6 in. x 65 ft. x 36 ft. deep, reinforced concrete and structural steel, with six sluice gates 2 ft. x 9 ft., and six gates 2 ft. 6 in. x 7 ft. 6 in. | 202,906 |
| Intake screens 35 ft. 6 in. on centers. Link Belt. panels 8 ft. 11 in. wide, 5-hp. motor drive through reduction gear, and de-watering pump (1,100 gal per minute) with 25-hp., 1,750-r.p.m. motor | 13,771 |
| Gate valve 5 ft x 5 ft (diameter) for tunnel between two units, bronze | 1,182 |
| (For contractor's compensation add 5 per cent to above) | |

# Large-Unit Foundations

By P. D. FREUDENBERGER
*Chief Draftsman Buffalo General Electric Company,*
*Buffalo, N. Y.*

IN DESIGNING and constructing the foundation for the 60,000-kw. turbo-generator at the Charles R. Huntley station of the Buffalo General Electric Company a particular effort was made to hold the possible values of deflection due to dead and live loads within definite limits to prevent misalignment of the large new generating unit.

The total weight of this machine alone is 1,500,000 lb. This load, together with the condenser, piping and dead load, is supported on an isolated island 60 ft. high and resting on bedrock. The rock was located approximately 40 ft. below the grade and was found to be of very high structural strength. A sample tested to 26,000 lb. per square inch in direct compression.

The substructure for the foundation is made up of ten interlocking steel sheet pilings, concrete-filled caissons, with a concrete mat at the top. Stresses in the concrete were kept within the following limits:

Direct compression, 400 lb. per square inch.
Combined compression and bending, 450 lb. per square inch.
Axial compression under column bases, 500 lb. per square inch.
Tension in reinforcing steel, 10,000 lb. per square inch.

No variation in deformation greater than 0.02 in. was permitted in the concrete shafts of the caissons.

The superstructure is made up of structural steel with a 4-in. covering of concrete. The concrete covering was requested by the manufacturer of the turbo-generator as an insulation against temperature changes. However, there are other advantages which warranted its use. The concrete covering forms a preservative against corrosion, is sound deadening and adds to the rigidity of the foundation in general.

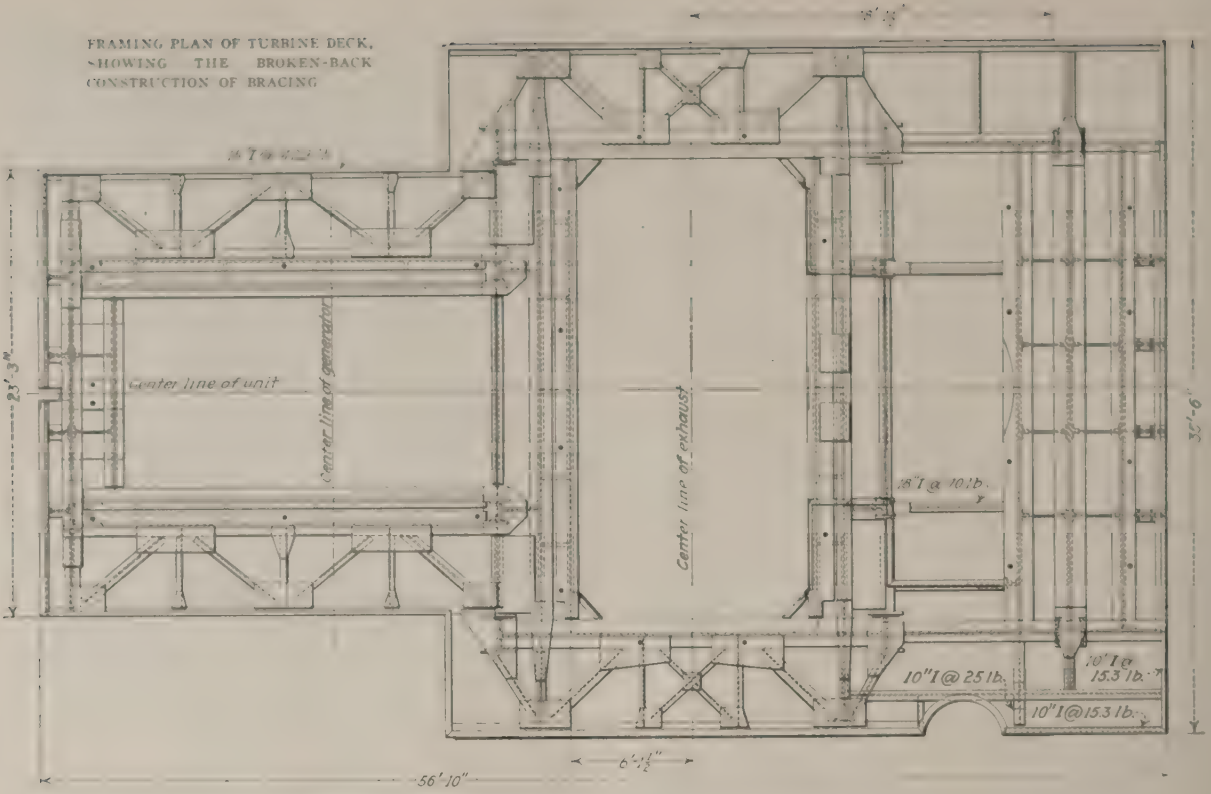
HEAVY BEAM BEYOND CROSS BRACING SUPPORTS CENTER BEARINGS OF THE UNIT

The size of the members forming the steel structure was determined by their deflection due to the dead load, plus 25 per cent of the turbine load as an allowance for impact. The deflection of the beams and girders was kept below 0.002 in. and that of the column shafts 0.04 in., with no variation at any point on the structure greater than 0.02 in. The 0.04-in. deformation referred to in the column shafts includes the dead load, the impact and the bracing stresses. The deformation due to the dead load

THE BRACING BETWEEN THE WIDELY SPACED COLUMNS ON THE RIGHT IS THE SAME AS SHOWN ABOVE

THE GAP IN THE STEEL FLASHBOARD AT THE TURBINE FLOOR LINE IS FOR THE THROTTLE VALVE

FRAMING PLAN OF TURBINE DECK, SHOWING THE BROKEN-BACK CONSTRUCTION OF BRACING



alone is below 0.02 in. The fiber stresses in the beams and girders is approximately 3,500 lb. per square inch throughout the structure.

The steel structure is braced in all directions to withstand shocks and make it rigid. In determining the stresses an arbitrary value of 25 per cent of the machine loads was considered as acting on the plane of the shaft. As the unit is located partly within an already existing building, the main girders could not be made continuous. This broken-back feature was taken care of by providing horizontal bracing in the main deck of the structural steel. Bracing members were designed with an allowable fiber stress of 16,000 lb. per square inch.

A novel method of obtaining the initial tension in the diagonals was employed. The amount of tension varied from 10,000 lb. to 30,000 lb. per member, depending upon its area in cross-section. It was necessary to use the varying values mentioned to produce measurable amounts of draw of from 0.01 in. to 0.015 in. The diagonals were not fabricated until the main members of the foundation were in their exact location and riveted. Each diagonal was then made from accurate measurements and templates taken in the field. The holes in the upper end of the member were made to size, while the ones in the lower end were sub-punched and at a location to allow for draw. With the diagonal in position the upper end was riveted. By means of four drift pins and a man with an air gun at either side, alternately tapping the pins with hammers, the diagonal was stretched to its required length. With the drift pins in place, the remaining holes in the connection were reamed and riveted. Finally the drift pins were removed, the holes reamed and riveted and the structure completed.

Stresses in the rivets were kept below usual values. The rivet values in shear for the primary members were 10,000 lb. per square inch for shop-driven rivets and 7,000 lb. per square inch when driven in the field. Many of the rivets have a very long grip, and at first some difficulty was encountered in making them tight. By double gunning and cooling the ends of the rivets no further difficulty was encountered.

## Cost of Outdoor Station

AN UNUSUAL outdoor hydro plant of 30-kw. rating was described by Joseph Franz, engineer Southern Berkshire Power & Electric Company, Stockbridge, Mass., in the ELECTRICAL WORLD Dec. 31, 1927, page 1350. Since the article was prepared the accompanying cost data have been received in reference to the installation, which is of the induction-generator type with an 18-in. turbine running under a net head of 10½ ft. A concrete dam was already available for use when the hydro plant was built. The generator is provided with a galvanized iron umbrella, built by a local plumber, to insure additional protection against the elements, and its erection cost is included in the erection expense. The umbrella was erected by one man in about one day.

ITEMIZED COSTS OF 30-KW. HYDRO PLANT

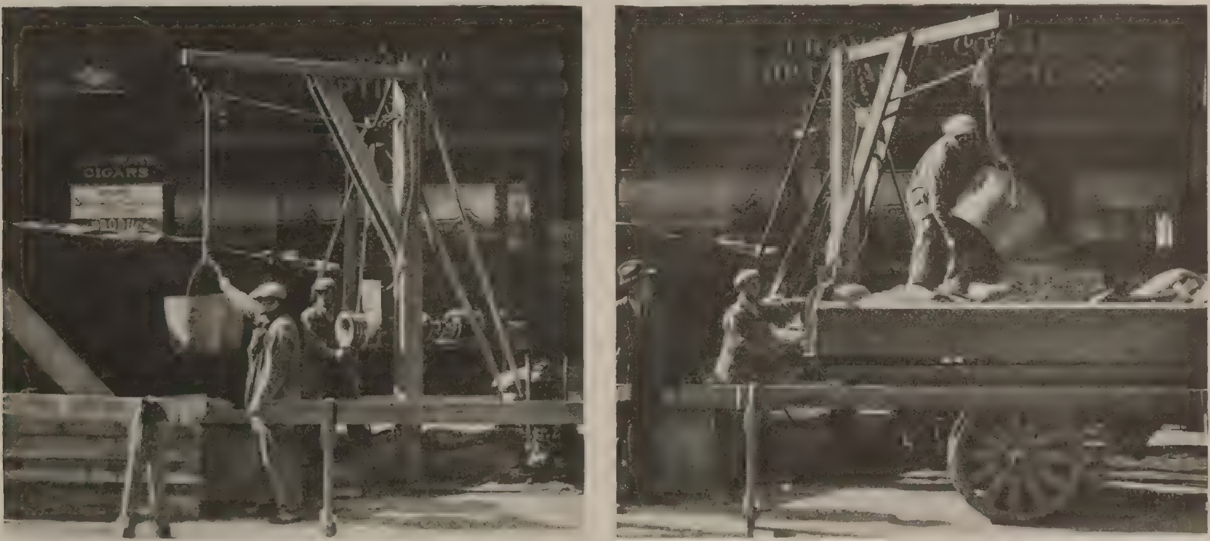
| | |
|---|---|
| Excavation and placing concrete flume | $1 002 05 |
| Headgate and racks | 88 05 |
| Turbine, f.o.b. West Stockbridge | 1,678 72 |
| Generator, f.o.b. West Stockbridge | 1,811 37 |
| Circuit breaker | 50 07 |
| Galvanized iron hood | 18 00 |
| Miscellaneous material and carting | 50 00 |
| Labor erecting and connecting unit | 411 15 |
| Engineering and superintendence | 650 00 |
| Total installation | $5,759 41 |
| Per kilowatt | $191 98 |

# Light-Weight Manhole Hoist

By R. L. Dodd
*General Foreman Underground Division,*
*Milwaukee Electric Railway & Light Company, Milwaukee, Wis.*

EXCAVATING deep manholes in busy city streets often presents a rather vexing problem in digging and disposal of the dirt. The dirt cannot be thrown up with shovels after the hole has gone down more than 6 or 7 ft. and quite frequently a city ordinance requires the immediate removal of the dirt. The use of winch-operated hoists in this work is not uncommon, but the hoists are not always easily portable and are not infrequently awkward and hard to handle. These difficulties have been pretty well disposed of in the hoist that is used by the underground division of the Milwaukee Electric Railway & Light Company.

This particular hoist was built by the company in the fall of 1927, has been in use since that time in the excavation of tunnel shafts and deep manholes and has performed very satisfactorily. The winch is the same as is used in building foundation caissons. It is a Thomas winch, equipped with a 2-hp. motor speed reduction gear, ratchet and large nigger head. The mast is 6 x 6-in. hardwood timber about 12 ft. long. The boom is a 3½x4½-in. x 7-ft. hardwood crossarm reinforced with a ⅛x2½-in. steel strap along the top. The boom braces are 2x6-in. soft wood. The back braces are 1¼-in. iron pipes, with the lower ends 7 ft. from the mast. The pivots at top and bottom of the mast are 1-in. bolts.



LIGHT-WEIGHT HOIST BEING USED TO REMOVE EXCAVATED MATERIAL FROM TUNNEL AND LOAD A DIRT TRUCK

The winch is attached bodily to the mast by means of one bolt and three braces so that it revolves with the crane. The power supply is wired to the top of the back braces, thence to the mast and the motor through flexible leads. The lifting buckets are made of transformer oil barrels cut in half and bail hooks welded on. The capacity of the hoist is about 500 lb. at a speed of 40 ft. per minute. The operator runs the motor continuously and controls the speed of hoisting and lowering entirely with the 1-in. rope wrapped around the nigger head. The ratchet prevents dropping the bucket if the motor should stop. This hoist, on account of the simplicity of its construction and the light weight of its parts, can be disassembled, loaded on a truck, moved a reasonable distance and erected at the new location by four men in two hours.

# Western Utility Freight Bill Is No Small Item

THE results of a recent inquiry among a number of electric light and power companies in the Western States shed light on the magnitude of their annual freight bills. Although a number of companies were unable to make any definite statement, and others could only approximate the annual costs because transportation charges were included in the cost, it was possible to get data for four operating systems. To reduce them to a comparable basis they have been worked out in terms of dollars of freight charges per kilowatt of installed plant capacity, with the following results:

| | Cents | | Cents |
|---|---|---|---|
| Company A | .62 to 78 | Company C | 87 to $1.15 |
| Company B | .67 | Company D | $1.40 |

The figures for Company A are exclusive of charges for some new heavy machinery and, therefore, represent an average year when no considerable amount of new construction is going on. Company D included freight charges on a considerable amount of new construction, which apparently accounts for the high freight charges per kilowatt of plant.

In plant capacity these companies range from somewhat less than 100,000 kw. upward. It is not to be expected that the unit figures will agree even roughly. The items are too few to justify the taking of an average, but they seem to warrant the assumption of 67 cents of freight charges per kilowatt of plant as a reasonable minimum, though this is seriously affected by a number of factors, particularly the rapidity of growth and the distance of transporting fuel and machinery.

If it be granted that the samples are representative of conditions in the eleven Western States, with somewhat more than 3,500,000 kw. of plants, an estimate for the combined freight bills of that section is $2,500,000.

For the same systems the freight bill ranged from 2½ cents to 8 cents per dollar of value of the freight.

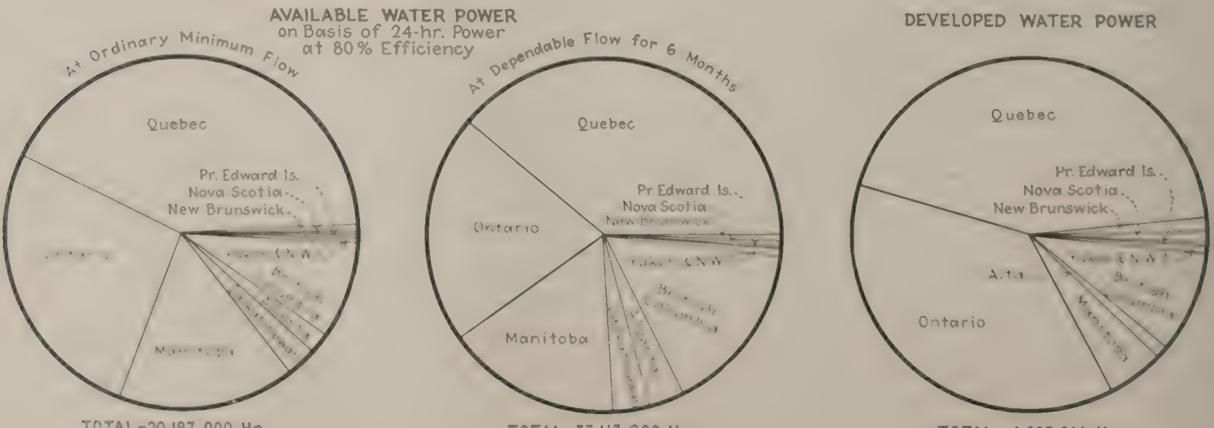

*Fig. 2—Available water power of Canada on basis of 24-hour power at 80 per cent efficiency*

# Water Powers of Canada*

### $900,000,000 invested in 5,000,000 hp. or about $180 per horsepower—33,000,000 hp. still available six months of year

CANADA has abundant water-power resources and they have been developed rapidly in late years. In 1910 the capital invested in water power was $121,000,000, and in 1927 it was $900,000,000—a growth of 600 per cent in seventeen years. The average capitalization per horsepower is $183 and there is a present-developed capacity of installed turbine horsepower of 4,883,266. The available 24-hour power at 80 per cent efficiency is 20,197,000 and that available on a six-month flow basis is 33,113,200. The total recorded resources would warrant the installation of about 43,000,000 hp., according to the Department of the Interior, Canada.*

The distribution of water-power resources is given in the accompanying table. It shows they are well distributed from coast to coast and in transmission distance of the larger cities. The growth in installation has been rapid as shown by the following data on horsepower installed: 1900, 170,000; 1910, 975,000; 1914, 1,946,000; 1920, 2,508,000; 1927, 4,883,000. Many projects are in prospect and it is expected that a rapid growth will continue.

The central stations utilize 4,012,428 hp.; the pulp and paper mills, 526,731 hp., while electrochemical and miscellaneous installations total 344,107 hp. The installation aggregates 5.13 hp. per capita. In the central-station industry there are 308 stations. Of these, 218, with an installation of 2,759,729 hp., are private plants, and 90, with an installation of 1,252,699 hp., are operated by public bodies.

New equipment installed and ready for operation during 1927 totaled 221,655 hp.; other undertakings were advanced to such a stage that additional installation to the extent of 378,000 hp. will be in place by midsummer of 1928, bringing the total for Canada to well over the five million mark, or double the installation at the end of 1920. Other developments in progress or definitely planned are expected to add another 2,000,000 hp. by the end of 1930.

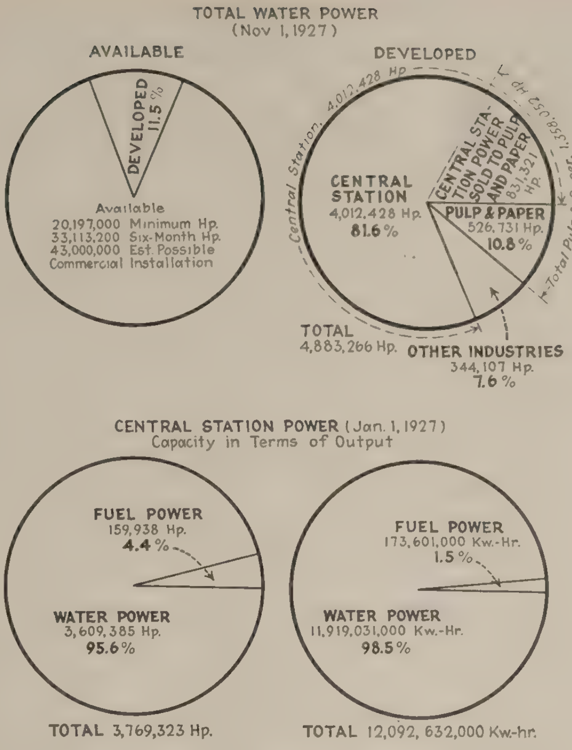

FIG. 3—UTILIZATION OF WATER-POWER RESOURCES OF CANADA

Of the total hydraulic installation 82 per cent is in central electric stations. This percentage has been steadily rising and there is every indication that the trend will continue.

Next to these in magnitude of hydraulic power use is the pulp and paper industry, which, however, is also a heavy user of purchased energy. This industry has a total of 526,731 hp. in connection with the mills themselves and purchases additional energy from central electric stations estimated to represent the use of more than 831,000 hp., giving a total utilization of 1,358,052 hp. of hydro power.

---

Column 2 includes only hydro-electric stations which develop power for sale.

Column 3 includes only water power *actually developed* by pulp and paper companies. In addition to this total, pulp and paper companies purchase from the hydro-power central stations totaled in Column 2 horsepower estimated at about 831,000, making a total of about 1,358,000 hp. actually used in the manufacture of pulp and paper.

Column 4 includes only water power *actually developed* in connection with industries other than the central-station and pulp and paper industries. These industries also purchase blocks of power from the central stations which are totaled in Column 2.

Column 5 totals all turbines and waterwheels installed in Canada.

Column 6 lists the population as of June 1, 1927, according to estimates made by the Dominion Bureau of Statistics.

Column 7 averages the developed water power per 1,000 population.

# Switch-Structure Equipment Schedules

### A logically and carefully arranged system of preparing drawings saves time and results in more valuable records

By W. F. Sutherland
*Toronto Hydro-Electric System*

SHOWING of structural details and equipment ratings on the same drawing is open to objections from many standpoints: Confusion frequently results from the admixture of electrical and mechanical features, particularly when structures are built by contractors. Revisions are difficult. Complete information cannot always be provided, owing to insufficient space. After a few years, office records are apt to become obsolete and of little value for accurate reference as to constructional conditions in the station.

*Figs. 1 and 2—Physical arrangement of equipment shown in separate drawings from circuits and apparatus ratings*

The physical arrangement only, and not equipment, size or capacity, is shown at the left. The size, capacity and kind of equipment, but not the physical arrangement, are shown at the right.

Special symbols have been used where necessary on this drawing to cover apparatus not usually shown on wiring diagrams; otherwise the notation is standard. Equipment is the same on all three phases unless otherwise shown. All equipment to be installed is shown in full. Reference numbers applying to equipment in this structure are shown in the upper half of each circle. Information regarding size or capacity of equipment is given in description column opposite corresponding number in table of Fig. 3 or in lower half of circle. Where nothing is stated in the "Required for Mounting" column, mounting equipment is either not required or is supplied with the apparatus. One set of lugs on each set of switches is to be painted the respective phase colors.

With the practice now followed by the Toronto Hydro-Electric System, a complete inventory of electrical equipment is always available, down to the nuts and bolts used for fixing the various component details. Records are always up to date. Drawings can be revised for the installation of an additional feeder in a few hours, instead of several days.

Three separate types of drawing are now issued: (a) Construction drawings for the building of structures; (b) diagrammatic equipment cross-sections; and (c) electrical equipment schedules.

(a) The construction drawings for structures follow standard practice, generally speaking. All details and dimensions necessary for the building of the purely mechanical portions of the structures are given. Conduit is shown on these and the main ground buses are also called for, detail grounding being left to the man on the job, who follows standard practice.

(b) The diagrammatic equipment cross-sections (Fig. 1) show the structure to scale and also the electrical equipment, approximately to scale, in the location intended for it. A separate cross-section is drawn for each type of compartment, feeder, transformer or otherwise, where these differ markedly in detail, and where differences cannot be dealt with satisfactorily by notes. No dimensions are shown, nor is any information given concerning the size of apparatus or type. The drawing is merely a picture, nothing else.

Disconnecting switches, current transformers, etc., are indicated with as little detail as possible, and thus become symbols for the actual equipment. Owing to the absence of detail information, these equipment cross-sections are quite general in their application, and thus one cross-section may readily represent all the feeders in a station irrespective of size of cables, current transformers, or other details subject to variation.

Elevations of compartments have been found of little use, and, in general, have been omitted, the cross-section usually giving all information required for the arrangement of apparatus in the structures.

(c) The electrical equipment schedule (Figs. 2 and 3) is important, for on it is given all the information as to what compartments are equipped, the apparatus used and its capacity. The drawing showing actual circuits and equipment rating (Fig. 2) is ruled off in vertical divisions, each representing one complete compartment. The individual cell or compartment numbers, which also appear on the structure drawing, are given at the top of each compartment. Below these appear the types of service to which the compartments are allocated, and, in a third line, the equipment designations, feeder or transformer numbers appear. Horizontal lines divide the vertical divi-

FIG. 3—EQUIPMENT IN THIS FORM IS INCLUDED ON DRAWINGS LIKE FIG. 2

sions into sections corresponding to station floors. Three lines not shown in Fig. 2 are reserved at the bottom for further reference notes, the bottom one carrying a designating letter corresponding to the section designations..

A complete wiring diagram is drawn, showing all apparatus in one typical compartment of each kind, the others being left blank except for notes calling for equipment similar to the typical compartments. If a compartment has no equipment, it is, of course, left blank. Each item is given a designation seen in the upper halves of the circles; the lower halves are reserved for size, in the case of copper and cables, or capacity in amperes for disconnecting switches, etc. The designation refer to a table on the same drawing, but shown separately here, in which complete details, except for size or capacity, are given. Only capacities or sizes appear on the diagram in most cases, not in the table, thus avoiding a multiplicity of references.

As arranged, the schedule provides a means of recording all essential information in a most convenient form. It is a wiring diagram, a means for installing the equipment, and a permanent record of all that has been installed. The arrangement has proved most successful on the Toronto Hydro-Electric System both in office and field.

## Remote Starting of Fire Pump

By D. F. Richardson

*General Electric Company, New York City*

RECENTLY the owner of a large country estate installed a gasoline-engine-driven centrifugal pump in a pump house remote from his home for the purpose of fire protection. It was desired to provide a simple method of remote starting, parallel to the control in the pump house, by means of which the pump could be started in either place.

The engine is started by an electric motor, power for which is supplied by a 12-volt storage battery. A contactor was installed in the pump house and its pilot circuit was wired for push-button control from either the pump house or the owner's residence, with indicating lamps at the latter point. The 12-volt battery circuit is also used for the pilot circuit.

Pressing the button at either point energizes the holding coil in the contactor and closes the motor circuit, starting the motor. A second set of contacts mechanically connected to the contactor shaft closes simultaneously with the motor circuit contacts and thus maintains the circuit to the holding coil after the pilot circuit is opened upon removal of pressure on the push button.

As soon as the engine starts firing a plunger attached to a piston in a small cylinder rises by oil pressure. This opens the engine choke and also opens a contact in the holding coil circuit, breaking the motor circuit and thus disconnecting the starting motor. This is particularly necessary as the engine runs faster when firing than when driven by the starting motor. This plunger-operated contact, when once opened by the operation of the engine, also prevents restarting the motor when the engine is running.

A red indicating lamp at the residence control point is wired in parallel with the motor terminals, and indication is thus given by the lighting of this lamp when the motor is started, the lamp remaining lit as long as the motor is running. When the engine starts firing and the motor is de-energized the lamp, of course, goes out. A pressure switch in the discharge line of the pump closes when water pressure is built up, thus completing a circuit to a green lamp which lights and indicates that the pump is operating satisfactorily.

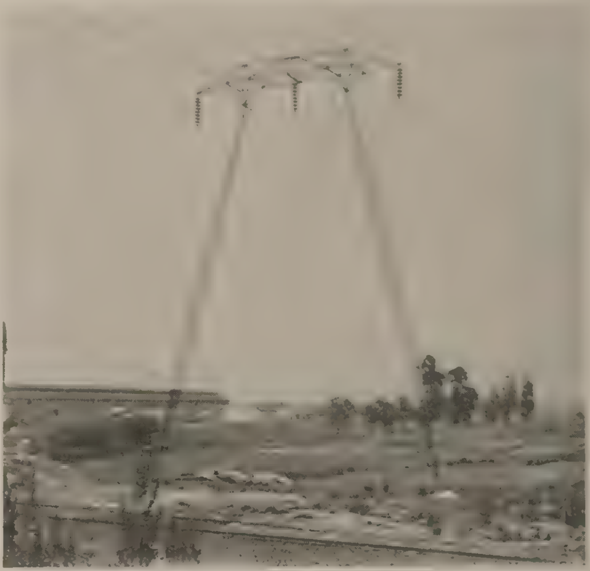
## Declares Selfishness Is an Evil of American Industry

SELFISHNESS is the greatest underlying evil that American industry is up against today and it is sapping the life out of practically all competitive lines, according to Charles J. Graham, president of the Bolt, Nut and Rivet Manufacturers' Association, Pittsburgh, in speaking before the Pennsylvania State Chamber of Commerce at Harrisburg, Pa., recently. In discussing the change in the bolt, nut and rivet industry, when from a high loss of $12,000,000 in 1924 the industry made a profit of approximately $6,000,000 per year in 1925, 1926 and 1927 on an invested capital of about $150,000,000, Mr. Graham said: "We found that we were conducting our individual companies on a basis that had lost all semblance of decency or fairness—fairness to ourselves, our competitors, our customers or to the world at large. We have entirely revolutionized our business methods. We have dug in deep and brought to the surface all of the evils we could find and have killed them one by one. We have developed a degree of unselfishness never before attained either in our industry or any other we know anything about.

"What has been the result other than a return in dollars? We can look the world in the face today with a degree of pride, our competitors are our friends rather than our enemies and we are conducting our business on a higher ethical plane than ever before and have created the same honest conduct in our business as heretofore ruled in our social lives. We have gone further than this. We have started a movement which we feel has solved the distribution problem in our own industry, and if the same plan is followed by all other industries it will be the greatest automatic stabilizer of business and labor conditions of anything heretofore attempted. Our distribution plan is very simple but very effective. We have been brought to realize the importance of the jobber in the proper and economical distribution of our merchandise.

"During the period of ruthless competition which culminated in our financial distress of 1924 we had ignored the existence of the jobber and became his chief competitor, thereby creating in him an enemy and becoming the chief aggressor in the rapid decline of our markets, brought about entirely by our lack of appreciation of his importance to us. This recent move of ours, in creating the proper channels of distribution of our products, is the greatest we have ever made in cost reduction. It will mean a marked reduction in our sales expense, and will also go completely through the organization, beginning where actual manufacturing stops—shipping expense, packing expense, clerk hire, accounting, stationery and office supplies—and such savings eventually will react to the benefit of the ultimate consumer."

## French Claim Many Advantages for New Towers



AN EXPERIMENTAL line has been placed in operation using articulated towers of unusual design, according to a correspondent in France. Among the advantages claimed are extreme lightness, greatly reduced foundation requirements, long spans, high resistance to transverse stresses, great adaptability to local conditions, unimpaired strength under conditions of conductor breakage and ensuing unbalanced forces and economies of construction and maintenance.

# Holding Company Upheld*

### Parent organizations evolve naturally. Have made possible tremendous growth and immeasurable economies. Objections discussed

By Col. George T. Buckingham
*Vice-President Illinois Power & Light Corporation*

The term "holding company" is a very loose and ill-defined term. It describes a great number of different things. In its broad sense it is a corporation which holds the stock of another corporation. In that sense fully 20 per cent of all existing corporations are holding companies. Banks, trust companies, insurance companies, investment trusts, personal family corporations and the like are as numerous as the sands of the sea, and all of them are holding companies.

But the term has come to have more limited meaning in financial circles, where it indicates in a general way a "parent company," one that not only holds the stock of operating corporations but exercises some degree of supervision over their operations. In the year 1924 one-fifth of all corporate dividends paid out by corporations in the United States was paid to other corporations which were the stockholders. This would indicate that one out of five of all corporations is to some degree a "holding company."

#### Developed From Small Beginning

In December, 1926, the output of current was more than 7,000,000,000 kw.-hr. That was considerably more than the output for the entire year 1903. On statistics the size of the industry has been multiplied by twelve in twenty years. In 1903 and theretofore the electrical industry consisted for the most part of single plants operating in a single town. The plant was a small affair; 250 kw. was a good big unit of generation; 500 kw. was a big plant. That plant furnished what lighting was required for that small community. The radius over which it could distribute energy was a few miles. The cost of production in these primitive plants was such that it did not occur to anybody to use electric current for power.

But as years went by the art developed with a rapidity and momentum never before known. Larger generating units constantly became the standard installation, and corresponding improvements in transmission were perfected at the same time, so that now, in the most recent study made by the Bureau of Commerce in the New England district, it is reported that the most economical plant for producing electricity is a plant of 200,000 to 300,000 kw.-hr. capacity; that no single generator smaller than 20,000 kw. capacity can economically be installed, and that the high-tension trunk lines, which had jumped up from 8,000 to 16,000 to 32,000 to 64,000, should be of 132,000 voltage capacity. Even now throughout the Middle West electric energy is generated in these huge central plants and transmitted over spider web tentacles hundreds of miles in every direction, so that one single central plant serves, not only for lighting but also power, literally scores of communities. Now, this rapid development of the industry necessitated huge capital investments and great corporate organizations, and so throughout the years a number of operating electrical companies have steadily decreased by consolidations and the size of the operating corporations have steadily increased.

Obviously, the machinery set up for that control, methods of accounting, methods of appraisement, local laws, etc., of the various states are different, and therefore the tendency is that every operating corporation in the electrical field should operate in a single state. Not only that, but in some states, such as Illinois, utility properties cannot be operated except by an Illinois corporation. If, therefore, a Delaware or any other foreign corporation desired to own property and conduct operations in, say, Illinois, Missouri and Kansas, the naturally indicated program would be to set up a parent company, which holds the control of separate operating companies, one or more in each state.

By this natural process the holding company came into being, and it is these holding companies whose securities are distributed to the public, and in the ownership of which thousands of people participate. Having traced briefly the genesis and evolution of the holding company, we may also consider briefly some of the objections that are urged against them in some quarters and that are the basis of inquiry here and there, even in some high quarters.

#### Some Objections That Are Raised

The first of these is that these huge holding corporations are interlocked and either are or tend to a unified single monopoly. That objection has recently been dispelled by two successive reports of the Federal Trade Commission, which put in about two years investigating it at the request of the United States Senate. That report showed that the largest of all the holding groups, Electric Bond & Share, is in some way related to an aggregate output of 10 per cent of the total in the country. The next largest single aggregation, the Insull group, is 8.7 per cent of the total. The North American Company is next with 7.1 per cent of the total. There are many others, but none of them, not even the great Byllesby organization, exceeds 4 per cent of the total. So the Federal Trade Commission reported that there is nothing that approximates a monopoly and that no such thing is possible.

The next objection which has been urged, notably by Senator Walsh, is that the great holding companies have been selling to the public enormous quantities of their securities and that the amount of these new securities put out in the last few years has greatly exceeded the value of the actual improvements and extensions that have been made. A committee of lawyers recently sent out a questionnaire to all the great holding companies inquiring what securities they and their subsidiaries had outstanding in the hands of the public, eliminating, of course, intercompany holdings, and, on the other side of the ledger, upon what actual assets these securities were based. Now, have in mind that the securities which the holding companies hold are for the most part the stocks of operating companies. These can be issued and get into existence only when approved by the commissions of the various states, as based upon adequate actual assets. In other words, the assets of the holding companies on their books are more closely appraised and approved in point of valuation than those of any other holding companies in existence.

---

*From an address before the Electric Association of Chicago.

The first 24 companies that reported these data (these were not selected but simply were the first ones that came in) were then tabulated. These 24 companies were representative and typical holding companies, representing in the aggregate 43.5 per cent of the whole output of the United States. The figures disclosed that in the years 1920 to 1926, inclusive, the ratio of actual investment assets to total outstanding capitalization varied from 110 per cent to 118 per cent. This is a showing which I believe cannot be duplicated by any group of holding companies in any other field.

Furthermore, there appeared before the Senate committee outstanding economists, state officials concerned with the administration of the state laws, officials of insurance companies and investment bankers. These people bore witness that, because of the rigid state regulation of the issuance of securities on the part of operating companies, the careful scrutiny and analysis that is given all these issues by the great banking houses, the tremendous publicity given to their operations, the securities of the great holding companies in the electric field are considered by investors to be at the very top in point of desirability and soundness. No security issue of any major holding company in the electric field has defaulted in years.

### Pyramiding of Control

Another objection that has been raised to the holding company is what Professor Ripley calls their "pyramiding of control." He says, in effect, that a holding company holds the controlling stock of a number of operating companies. The holding company itself has outstanding preferred stock which does not vote. Its common stock, or a majority of it, having voting rights, is held within the control of a small group of people, who are the leading spirits in the enterprise. This, he says, is wrong; that all stock, common or preferred, should have, but does not have, a vote; that it is a vicious thing for a comparatively small percentage of the stock to control a great corporation.

With the professor on this basic, economic question I take direct issue, both in fact and in theory. I affirm that his statement of fact is erroneous. In many of the leading holding companies, if not most of them, all shares of stock have a vote. Indeed, in some states, like Illinois, for instance, all shares must have a vote.

And I also affirm that in principle it is not of the slightest consequence whether all of the stock of a great holding company held by the public votes or whether it does not. The result is exactly the same. Swift & Company, by way of illustration, a great corporation not in the utility field, has only one class of stock and all of it votes. The Swift family has managed the corporation for many years and holds only a minor fraction of that stock. The stockholders, without exception, and practically unanimously, send their proxies to the managing people in favor of retaining the management in its place.

There are many other minor questions which have been raised as to the operation of holding companies. Time is too short to review them all. We have considered the major ones, but it is my belief that the great holding company of the present day is just as much a necessity of the modern industrial era as is the locomotive, the super-power house and the giant transmission line. These things all go together of economic necessity, and they all develop along parallel lines.

### Work of Promoters Not Typical

Parenthetically, it may be said that there are certain companies, evolved by promoters rather than by constructors, which fall outside these generalizations. There are sporadic instances of inflated capitalization in the public utility field, exactly as there are in other fields, but they are not typical, are not numerous and, in size, are relatively unimportant. What shortcomings and misdeeds are to be laid at their door are not fairly attributable to holding companies generally. Disregarding this very insignificant minority, the achievements and the benefits of the great holding companies in the electric field may be fairly summarized thus:

They have brought to every city, to most hamlets and within striking distance of most farms a reservoir of power—power which is the cornerstone of civilization—in quantity never before dreamed of.

They have made this power reliable and dependable, so that users everywhere, large and small, may with confidence base their operations on a constant, as well as a limitless, supply.

By the economies of financing, manufacture, organization and operation, inherent in their great operations, they have made power available to the user at low cost.

This is practically the only product, commodity or service now sold to the public at prices lower than pre-war and while all other prices have been upward.

By the wide sale and distribution of their securities they have brought millions of citizens into the ownership of the utilities which serve them. They have done more to "peopleize" industry and thus to combat socialism than all other agencies combined.

Their properties are owned by more people than any other group of properties in the world. Their securities have a record of safety of principal and continuity of interest and dividends not even approximated by the record of any other industry.

This, then, is a résumé, abbreviated and inadequate, of the record of the great holding companies in the public utility field. Collectively they may, without fear, challenge comparison with the record of any other group.

Their operations have been conducted in broad daylight, with the utmost publicity to their millions of customers and to their millions of security holders.

When the amazing history of the twentieth century comes to be written—the century of super-power—and of the prosperity that follows in its train, the achievements of the great holding companies and their developers will be remembered by the millions to whose well-being and prosperity they have contributed so materially.

# Appliance Repairs— A Profitable Utility Service

By H. W. Ewald
*General Sales Department Duquesne Light Company, Pittsburgh, Pa.*

BROKEN APPLIANCES in customers' homes bring no return to the central station and represent an investment loss on the part of the purchaser. By helping our customers to get their electrical devices repaired, we not only add load to our lines, but we increase the public's confidence in things electrical and pave the way for the selling of new appliances.

The Duquesne Light Company has a special department equipped for repairing all electrical appliances used in the home. Our customers are invited to leave their depreciated equipment at any one of our thirteen gas and electric shops. From these stores they are sent to the appliance repair department. It matters not where the device was originally purchased, we are glad to repair it, if it is worth fixing, and the cost of this service to the customers is very reasonable. We aim to give prompt service, and, in many cases, the appliances are repaired within twenty-four hours. It often happens that a device has to be taken apart before one can tell if it is worth repairing; if it is not, the customer is notified, as a rule by telephone. In this way, the customer can decide upon the desirability of extensive repairs or the purchase of a new appliance.

A merchandising truck is also operated for appliance selling, together with home service work. The men on this truck have been trained in our appliance repair department. They make minor repairs in the customer's home, free of charge. When more extensive repairs are required, they bring the apparatus into our shop and later return it to the customer ready for service.

Several years ago the policy of exchanging new iron cords for old ones, free of charge, was inaugurated. From that time until now, this service has grown steadily. We are replacing about 15,000 iron cords a year. No charge is made, except in those cases where the terminals of the cord are damaged. Many appliances are put on the shelf because the cords are damaged, but, as a rule, the customer thinks the fault is more serious.

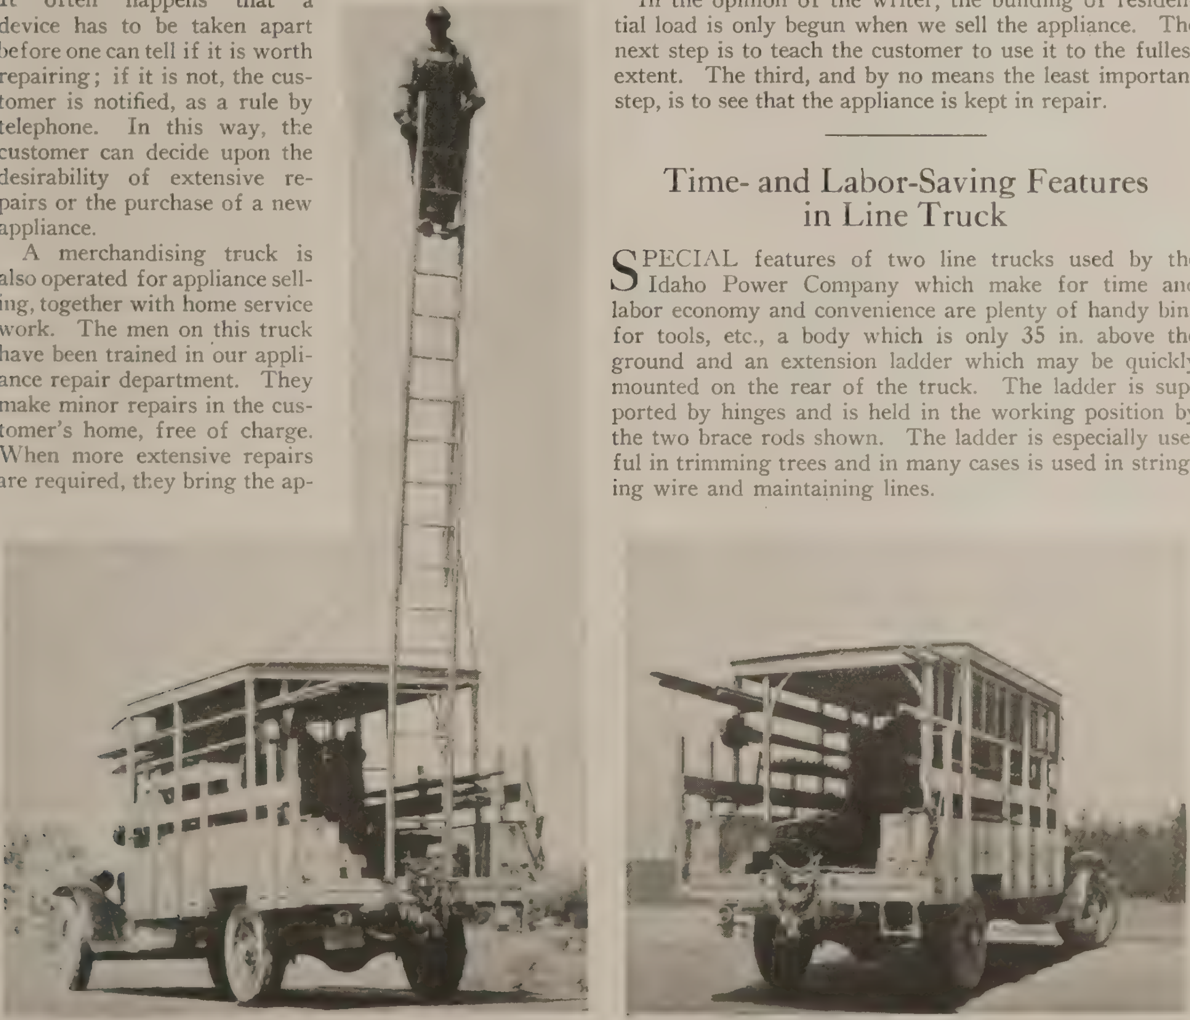
We have had special iron cord boxes manufactured for our free cord service. Attractive ads appear on the sides of the box telling the high points of this service. Rubber stamps are used to mark each box with the kind of cord that is inclosed in order to assure correct exchanges. Special gummed labels, carrying announcements of our repair service, are used to paste on the special boxes containing the repaired devices and greatly assist us in returning the appliances in good order.

The repair department also serves the function of a laboratory for testing new appliances put on the market from time to time. The shop is fully equipped with modern machinery and special tools, together with a personnel of experienced mechanics. A complete stock of parts for all makes of recognized standard appliances is kept on hand.

In the opinion of the writer, the building of residential load is only begun when we sell the appliance. The next step is to teach the customer to use it to the fullest extent. The third, and by no means the least important step, is to see that the appliance is kept in repair.

# Time- and Labor-Saving Features in Line Truck

SPECIAL features of two line trucks used by the Idaho Power Company which make for time and labor economy and convenience are plenty of handy bins for tools, etc., a body which is only 35 in. above the ground and an extension ladder which may be quickly mounted on the rear of the truck. The ladder is supported by hinges and is held in the working position by the two brace rods shown. The ladder is especially useful in trimming trees and in many cases is used in stringing wire and maintaining lines.



EXTENSION LADDER ADDS TO USEFULNESS OF LINE TRUCK

# A Banker's View of the Electric Refrigeration Industry

### Situation in the industry such there is little fear of competition. Financial backing for new enterprise would be extremely hard to obtain

By F. J. Fuller
*Vice-President Central Union Trust Company*

ELECTRIC refrigeration has been in the process of intensive development during the last five years and has met with all of the vicissitudes which a new industry should expect to encounter. Difficult patent situations have had to be worked out and in all probability additional adjustments and litigation of patent rights will be necessary in the future. Large capital expenditures have been made for plant facilities, equipment, inventory, experimental work and the establishment of sales organizations. This capital was, for the most part, obtained by the sale of stock to an enthusiastic public under very favorable market conditions. In some instances bonds and other fixed obligations were issued and a fairly wide distribution of the refrigerating-company securities was obtained.

As is usual in the case of a more or less novel product, the electric refrigerator has, in many directions, had a popular appeal, stimulated by costly advertising and other high-pressure methods of publicity. In the early stages of the development the demand outstripped the supply and many companies, lured by the possibilities of large profits, entered the field, each offering an article for which it claimed superiority by reason of improved patents, greater efficiency in operation, simplicity in construction, and so forth.

In the efforts to get into production on a large scale, many of the companies in the industry suffered severely from mistakes in engineering, errors in design and mechanical defects. Overhead in all departments increased enormously, economy in operation was lacking and, despite a large volume of business, the capital investment showed little, if any, return in far too many instances.

With the distribution of the product, servicing problems were encountered, and the result of hasty manufacture, both of machines and of boxes, began to tell. Dissatisfaction spread among the users of the machines and the good will of the companies was, to some extent, impaired. The resulting sales resistance can be successfully combated only if the manufacturer offers a "quality product," provides adequate servicing facilities and maintains a selling organization thoroughly equipped to educate an unconvinced but expectant public in the advantage, convenience and even the necessity of electric refrigeration.

The situation in the industry is so well and generally known that there should be little fear of competition from new enterprises for some time to come. Assuming that the inventor or promoter has the temerity to seek entrance into a field that is so thoroughly covered, he will, undoubtedly, find it quite impossible to obtain the requisite financial backing.

On the whole, the securities of the companies in the industry have proved a distinct disappointment, and substantial losses have been suffered by their holders, justifying the attitude of the investment banker and his public to look askance at the securities of new electric refrigerating companies, which have to go through the lengthy and discouraging processes of organization, experimentation and development with their attendant uncertainties and disappointments.

A great deal has been accomplished during the recent months toward the stabilization of the industry, but the field is highly competitive and few companies have the financial resources with which to carry out the program indicated. Satisfactory results will be slow in forthcoming, but an efficient and careful management, with adequate working capital, building cautiously from a solid foundation, with a view to development and expansion in a conservative way, can look with confidence to the future. It will virtually be a case of the survival of the fittest.

## *Five Recommendations Made to the Refrigeration Industry*

A REFRIGERATOR manufacturer believing that the industry will not prosper until something has been done to stabilize it offers the following five recommendations:

1. Some organization corresponding to the Society of Automotive Engineers (S.A.E.) is needed in order to stabilize and standardize engineering.

2. To stop constant bickerings between the major companies as regards infringement some solution along the line of cross-licensing of patents should be worked out.

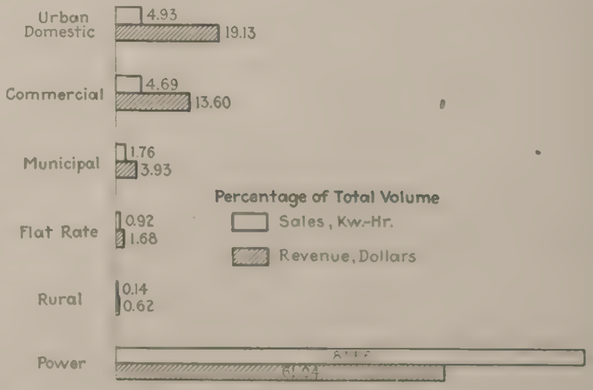
3. There should be a curtailment of unwarranted advertising claims, which are detrimental to the industry as a whole.

4. Price cutting should be stopped and prices stabilized so that every one in the industry, who is entitled to do so, can get a fair return on the money invested.

5. The ethics to be followed by salesmen should be laid down by the executives of the company and "knocking" of a competitor's product should not be resorted to as often has been done in the past.

---

## Customer-Revenue Values Compared



AN ANALYSIS of customer classifications and resulting revenues has been prepared by E. H. Jenness of the Ohio Public Service Company, Elyria, Ohio. The records of this utility indicate that the factors are distributed as shown above.

# Southern Pine and Creosoting*

### Opinions of pole users. Data on cost of poles. Methods of inspection and purchase. Life of poles in Southern territories

By L. W. W. Morrow
*Managing Editor* Electrical World

IN A survey of opinions in all sections and after talking with both producers and users of creosoted poles the writer gained some general impressions and facts which are presented for constructive purposes. A very important part of the job involves the timber before treatment. Careful inspection in the woods should be followed by an immediate shipment to the storage yards or to the treating plant. The green timber decays rapidly if left lying on the ground or if subjected to moisture. Upon arrival at a treating plant the timber, if stored, should be watched carefully and treated when seasoned sufficiently. If proper precautions are taken in these matters, it makes little difference whether the timber is cut in winter or in summer. Winter-cut timber is less apt to be affected by decay or checking during the seasoning process, but it is difficult to peel the inner bark. Summer-cut timber peels readily but is more apt to weather check during seasoning.

If time is available for air seasoning, less creosote is needed in the treatment and therefore the product is more satisfactory from the standpoint of immediate use after treatment, because leaching is less. Buyers of poles, ties and structural timber, however, usually wish immediate deliveries, and the creosoting companies find it uneconomical to fill their yards with timber that may or may not satisfy the various purchasers' requirements. When air seasoning is complete, the creosoted treatment of 4 lb. per cubic foot must be given and the material then stored again in the yards until purchase is made, when a further treatment is necessary. This practice involves double handling and added costs. Thus the long time required for air seasoning places a time premium on using an immediate treatment of green timber. This requires about sixteen hours at a modern plant.

### Storage Prior to Shipping Reduces Leaching

Another aspect of the situation involves the practice of immediate shipment after treatment. The poles are covered with creosote oil and are subject to some surface leaching, and thus are inconvenient to handle, but if the treated poles are stored for a short time, practically all leaching ceases and dry and more conveniently handled material is available for use. Some telephone and railroad companies specify storage after treatment as part of their practice in using creosoted material.

Another element is that buying habits and market demands are not adjusted for best results. The pole producer is compelled to cut, treat and ship the poles quickly to meet a construction program that is almost contemporaneous with the purchasing program of the utility.

Personal observation leads to the belief that a better understanding of the creosoting business on the part of purchasers would help greatly in smoothing out the production programs of the creosoting companies and at the same time insure to the purchasers a uniformly good product.

Rigid inspections by utilities are difficult to institute in many cases and the best protection for small purchasers is to buy from creosoting companies of established reputation. Any creosoting company that expects to remain in business must develop a method of inspection and treatment that will insure the production of a uniformly good product.

### Service Experience and Opinions of Four Utilities

Service experience with creosoted timber may be had in many sections of this country, and a typical cross-section of comment is given in the following excerpts:

*Utility A.*—We have standardized on creosoted poles for all service from secondary distribution to 110-kv. transmission lines. The replacements are from 1½ to 2 per cent for the first six or seven years, after which they cease until about the fifteenth year, when some poles start to decay. The first replacements result from the use of poor timber or from improper treatments. The life of a good and properly treated pole we find is from 25 to 30 years. Our linemen have no criticism of these poles as regards working on them.

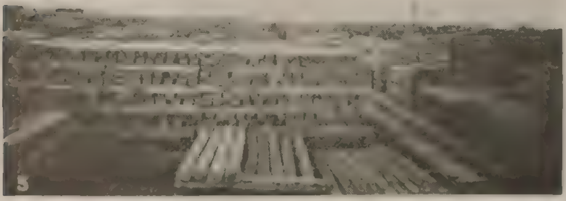
*Utility B.*—We are using creosoted poles entirely now and have over 40,000 of these poles on our system. We find creosoted poles very satisfactory and their life is at least twenty years. In very hot weather the linemen take some precautions in working on these poles because of their conductivity. The men who object to working on the poles at first are linemen from the North or East who have had no experience with creosoted timber.

*Utility C.*—As a result of various investigations we have standardized on the use of creosoted poles. These are purchased on strict specifications so far as mechanical defects are concerned. They must be thoroughly seasoned and then are given a 10-lb. treatment. This treatment penetrates to a depth of from 3 to 4 in. from the surface. Our poles with this treatment give an average life of about 25 years.

*Utility D.*—The use of creosoted poles on a 44-kv. line on this system dates back to 1907. These poles are now standard with us on all 44-kv. and 110-kv. lines and have been recently adopted for 2,300-volt lines and secondary distribution in towns and cities. We have had time to form a true estimate of the two elements often mentioned as disadvantages of creosoted poles—

---

**Conclusion of article started in Feb. 18 issue.*



*Handling, framing, inspecting and seasoning of poles preparatory to treatment*

1. Incoming poles being unloaded in the yards of one large creosoting company
2. Framing and inspecting poles in the yard before treatment.
3. Trams loaded with poles and entering the treating retort.
4. Poles stored in the yards for air seasoning.
5. Ties stored in the yards for air seasoning.

TABLE I—NUMBER, UNIT COST AND LIFE OF POLES IN SOUTHEASTERN AREA*

| Kind of Pole | Number | Unit Cost in Yard | Unit Cost in Place | Life in Years | Treatment |
|---|---|---|---|---|---|
| Chestnut........... | 207,253 | $6.64 | $11.20 | 9 | Practically none, a few brushed carbolineum |
| Cypress............ | 35,700 | 8.20 | 11.20 | 12 | Practically none, a few brushed carbolineum |
| Western red cedar... | 16,033 | 17.60 | 21.10 | 11½ | ⅜-in. and ½-in. Pentrex |
| Native red cedar.... | 14,673 | 11.40 | 16.20 | 21½ | None |
| Creosoted pine...... | 143,171 | 14.92 | 20.30 | 23 | 8, 10, 12-lb. empty cell and 10, 12-lb. full cell |
| Juniper............ | 46,282 | 6.83 | 10.96 | 9 | None, a few brushed carbolineum |

* Southeastern Section N.E.L.A. overhead systems committee, Memphis, 1927.

TABLE II—RANGE IN POLE PRICES OF SIX KINDS OF POLES USED IN THE SOUTH*

| Kind of Pole | Price, f.o.b. Yard Low | Price, f.o.b. Yard High | Price, f.o.b. Yard Average | Price in Place Low | Price in Place High | Price in Place Average | Cost of Installation, Average |
|---|---|---|---|---|---|---|---|
| Chestnut....... | $4.25 | $12.75 | $6.64 | $7.00 | $14.75 | $11.20 | $4.56 |
| Cypress........ | 5.00 | 17.00 | 8.20 | 7.00 | 18.00 | 11.20 | 3.00 |
| Western red cedar........ | 13.85 | 25.00 | 17.60 | 19.10 | 35.00 | 21.10 | 3.50 |
| Native red cedar | 7.50 | 15.30 | 11.40 | 12.50 | 19.90 | 16.20 | 4.80 |
| Creosoted pine.. | 11.00 | 25.00 | 14.92 | 14.87 | 32.50 | 20.30 | 5.38 |
| Juniper........ | 5.00 | 8.00 | 6.83 | 9.15 | 12.95 | 10.96 | 4.13 |

* Overhead systems committee, Southeastern Section, N.E.L.A., 1927

TABLE III—LIFE OF SAME KIND OF POLES IN THE SOUTHEAST*

| Kind of Pole | Minimum Age, Years | Maximum Age, Years | Average Age, Years | Treatment |
|---|---|---|---|---|
| Chestnut........... | 3 | 15 | 9 | None |
| Cypress............ | 6 | 20 | 12 | None |
| Western red cedar... | 8 | 20 | 11½ | Butt |
| Native red cedar..... | 18 | 25 | 21½ | None |
| Creosoted pine...... | 17 | 40 | 23 | 8, 10-lb. empty cell |
| Juniper............ | 7 | 10 | 9 | None |

*Overhead systems committee, Southeastern Section, N.E.L.A., 1927

that is, conductivity and leaching. These factors receive practically no consideration now and are regarded as of very minor importance compared with the advantages resulting from the use of creosoted poles. We use a 10-lb. treatment.

Many other utilities, railroad and telephone companies can be quoted in about the same words and these purchasers continue to use and to buy creosoted products. Their major consideration has been the purchase of poles that satisfy service conditions, delivery conditions and that are available on a competitive basis in the pole market.

### N.E.L.A. Committee Reports Practices of Twenty Southeast Companies

In a recent survey of the overhead systems committee of the Southeastern Section of the N.E.L.A. some interesting data on the use of poles in that region were compiled. These data are given in Table I. It may be noted that of the 463,112 poles reported in this 1927 report the following percentages exist:

| | |
|---|---|
| Chestnut, 45. | Native red cedar, 3.1. |
| Cypress, 7.7. | Creosoted pine, 31.0. |
| Western red cedar, 3.4. | Juniper, 9.8. |

Of the twenty utilities reporting, twelve used chestnut poles, eight cypress, two native red cedar, nine Western red cedar, fifteen creosoted pine and three juniper. The utilities which used chestnut poles were in the mountain section of the region and those using cypress poles were in the tidewater region. The native timber is thus used in local markets. Several companies in the territory which is covered by the Southeastern Section of the N.E.L.A. have discontinued the use of chestnut and Western red cedar poles for no announced reason and there is a marked trend toward a greater use of creosoted pine poles because of long life and great strength.

In Table I the average cost was based on a 35-ft. pole with 7-in. top, but the range in prices as given by the utilities show data which give an interesting bearing on commercial conditions in the pole industry in the South. These data are given in Table II. The life of poles depends upon many factors, but Table III gives the data on Southern utility experiences as compiled by the overhead systems committee of the Southeastern Section of N.E.L.A. The native red cedar shows a remarkable life span. Data of a complete character are still meager on pole life, so that generalizations are unsafe.

### Compares Cost and Life of Different Classes of Poles

An interesting comparison of pole cost and life of pole was made by the committee. The poles chosen were 35 ft. with 7-in. top made of juniper, Western red cedar and creosoted pine. Costs were computed at the end of twenty years and at the end of 40 years and the assumption was made of 40 years of life for creosoted pine. These cost data are as follows:

TABLE IV—COST OF JUNIPER, WESTERN RED CEDAR AND CREOSOTED PINE POLES AT END OF TWENTY YEARS

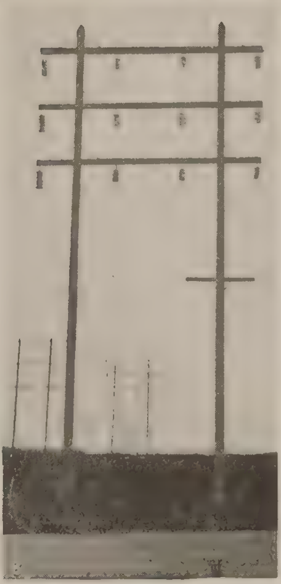
| | Juniper | Western Red Cedar | Creosoted Pine |
|---|---|---|---|
| First cost | $13.88 | $19.07 | $18.04 |
| Replacement at end of life | 13.88 | ...... | ...... |
| Transferring | 2.00 | .... | .. |
| Total | $29.76 | $19.07 | $18.04 |
| Annual cost at end of twenty years | 1.49 | 0.95 | 0.91 |

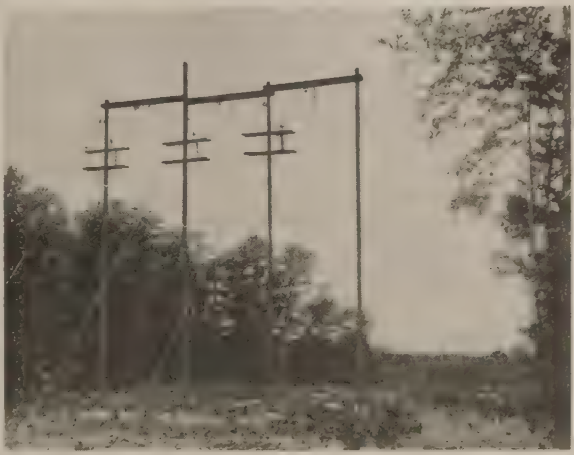
TABLE V—COST OF THE SAME KIND OF POLES AT END OF FORTY YEARS

| | Juniper | Western Red Cedar | Creosoted Pine |
|---|---|---|---|
| First cost | $13.88 | $19.07 | $18.04 |
| Replacement cost | 47.64 | 21.07 | ...... |
| Total | $61.52 | $40.14 | $18.04 |
| Annual cost at end of 40 years | 1.54 | 1.00 | 0.45 |
| Per cent | 2.42 | 1.22 | ...... |
| Force to break pole, lb | 1,140 | 1,420 | 2,200 |

The consensus of opinion favors the use of No. 1 domestic oil for creosoting, using the A. T. & T. empty cell specifications with 8 or 10 lb. treatments. No very accurate records are kept on life of poles and effects of treatment, but the trend is to discontinue butt treatment toward the full creosoted treatment.

The use of creosoted products is increasing rapidly, and the woods operations and treatment processes have been perfected by reputable companies. There is no doubt this strong, long-life material will continue to hold an important place in the timber market and will afford utilities a source of supply for poles, ties and structural timber. Many reports on service experience with creosoted poles where the poles have been handled properly from woods to consumer show that failures in service are negligible and that a long life can be obtained. The creosoted pole purchased in an intelligent manner is a pole that may be relied upon by the industry.





*Three types of Southern lines using creosoted Southern pine poles*

6. Ties loaded on freight cars ready for delivery to the treating retorts.
7. A 66-kv. line using creosoted poles. Southwestern Gas & Electric Company.
8. A four-circuit, 66-kv. line using creosoted poles and crossing swampy territory.
9. Unusual construction of a 66-kv. line using creosoted poles for supporting the conductors.

# Analyzing Economies of Purchased Power

### Study of power requirements of expanding industrial plant shows that it is cheaper to buy power than to make it

By H. C. Thuerk
*Manager Erie Lighting Company, Erie, Pa.*

> *When several methods of doing a job are available, there is no more reliable way of determining which is the most economical than to establish a balance sheet on which advantages and disadvantages of each procedure can be listed and evaluated. The accompanying article illustrates an analysis which one industrial concern made to determine whether to purchase power or generate it. When all fixed and operating charges are included there will be little opportunity for differences in conclusions unless choice of unit figures or evaluation of intangibles are questioned.*—Editor.

In the early part of 1926 it became necessary, on account of an increased demand for its product, for one of the primary power customers of the Penn Public System to erect new factory buildings. This company manufactures a specialty product and employs a considerable number of automatic machines in its manufacturing process. All of the heat-treating necessary is accomplished in six electrically heated furnaces. No process steam is required in the manufacturing process, the only requirement for steam being for heating in the winter time.

An investigation was made at this particular time to determine if any savings could be made by installing a small power plant and generating power instead of purchasing it as was being done at the time. A preliminary investigation showed that it was not practicable to consider the installation of a steam-engine-driven plant. The consideration finally narrowed down to either the continuation of purchased power or the installation of a Diesel engine-generating plant.

The power requirements during the first six months of 1926 are given in the table below.

On the basis of power requirements for the first half of 1926 it was decided that the present load should be considered as having a demand of 150 kw. and a monthly consumption of 40,000 kw.-hr. It was estimated that when the industry moved into its new buildings the average monthly consumption should be 80,000 kw.-hr., with a maximum demand of 225 kw. The power factor was assumed to be 90 per cent, as a considerable portion of the load consisted of electric heat-treating furnaces, which operated at a very high power factor.

It was agreed that the proposed Diesel engine plant should consist of two units, each unit to consist of one 350-hp. engine direct connected to a 225-kva., 230-volt, three-phase, 60-cycle alternator. The estimated cost of the proposed plant is given in the accompanying table.

In the first item of the table it is assumed that this includes the erection of the engines and the services of an erecting engineer. It also includes a complete switchboard for the two units and all other auxiliaries not mentioned elsewhere in the estimate. It will be noted that the table does not include the cost of the building to house the power plant, nor the rental value of space which might be occupied by the plant in one of the new buildings. No allowance was made for the installation of a crane or hoist for facilitating repairs or for possible alterations to one of the new buildings to accommodate the proposed engines. It will be seen that the cost of the proposed plant was approximately $133 per kilovolt-ampere, which represents a conservative estimate for a plant of this size.

### Fuel and Lubricating Oil Costs

In determining the fuel and lubricating oil consumption and maintenance costs for the proposed plant reference was made to the operating data of a large number of Diesel engine plants. This substantiating data appeared in the Electrical World of March 5, 1927, under the title "What Are Diesel Engine Power Costs?" Since the results of 58 Diesel engine plants were tabulated in this article, it was felt that these operating data were fairly reliable.

A fuel consumption of 0.75 lb. per kilowatt-hour generated was used in determining the fuel cost of the proposed plant. With fuel oil weighing 7½ lb. per gallon, this represents a performance of 10 kw.-hr. per gallon of fuel. The management of the company based the cost of fuel oil at 8 cents per gallon delivered in tanks at the power plant. Lubricating oil consumption was taken at 800 kw.-hr. per gallon, at an average cost of 60 cents per gallon.

### Repairs and Maintenance

Maintenance was taken at 2¼ mills per kilowatt-hour generated. This includes both labor and material. The item of maintenance is one which varies widely, depending upon a number of factors. It is only by taking an average value of a number of plants which have been in actual operation for some time that it is possible to obtain an estimate that will be reliable.

### Attendance Labor

The management of the company decided that one-half of one man's time at 70 cents per hour should be charged against the operation of the oil engine plant. There was some question as to whether a competent

POWER REQUIREMENTS DURING FIRST SIX MONTHS OF 1926

| Month | Kilowatt Demand | Kilowatt-Hours |
|---|---|---|
| January | 160 | 38,000 |
| February | 152 | 38,400 |
| March | 152 | 40,400 |
| April | 144 | 38,000 |
| May | 152 | 28,800 |
| June | 136 | 24,800 |

ESTIMATED COST OF PROPOSED GENERATING PLANT

| | |
|---|---|
| Engines and alternators, including erecting | $50,000 |
| Freight—300,000 lb. at 16½ cents per 100 lb. | 495 |
| Haulage at $3 per ton | 450 |
| Foundations—100 cu.yd. per unit at $12 | 2,400 |
| Fuel oil storage tanks and piping | 2,000 |
| Auxiliaries, including air compressor, oil pump, etc | 2,000 |
| Engineering, supervision, inspection and contingencies at 5 per cent. | 2,800 |
| | $60,145 |

operator could be obtained at this figure, but it was finally decided to use this amount in determining the power costs.

The power taken by the auxiliary equipment in the plant would probably approximate between 3 and 5 per cent of the gross generated kilowatt-hours. It was assumed that the losses in transformers when power is purchased would just about compensate for the power used by the auxiliaries. It was estimated that for cooling water 1 cu.ft. per kilowatt-hour would be required.

Fixed charges, which included interest, depreciation, taxes and insurance, were taken at 15 per cent. In the comparison of power costs it was pointed out that one manufacturer of oil engines places depreciation alone at 8 per cent, and that the Inland Revenue Authorities in England increased the depreciation from 5 to 10 per cent in 1927 on Diesel engine plants after such a request had been made by the Diesel Engine Users' Association of that country.

### Comparison of Total Costs

Having decided upon the various quantities to be used in the cost computation, a table showing power costs under existing and future load conditions was prepared.

The total annual cost of purchased power for the present load was $10,231.44, or an average cost of 2.13 cents per kilowatt-hour. This represents an annual saving through the purchase of power of $5,458. This cost was based on the use of the regular industrial power schedule of the Penn Public System.

Under future load conditions it would be possible to make use of a combination of the regular power rate and the off-peak power rate. The total annual cost of purchased power for future load conditions would be $16,233.60, or an average cost of 1.69 cents per kilowatt-hour. The total annual saving of purchased power under future load conditions would be $5,096.

The investment cost necessary in transformer equipment for purchasing future power requirements was approximately $2,000. At 15 per cent the annual fixed charges on this equipment would be $300. Deducting this from $5,096 gives a net annual saving of $4,796.

COST OF GENERATING POWER FOR PRESENT AND FUTURE LOADS

| | Present Load | Future Load |
|---|---|---|
| Fixed charge—15 per cent of $60,000 | $9,000.00 | $9,000.00 |
| Fuel at $0.08 per gallon | 3,840.00 | 7,680.00 |
| Lubricants at $0.60 per gallon | 360.00 | 720.00 |
| Repairs and maintenance at $0.00225 per kilowatt-hour | 1,080.00 | 2,160.00 |
| Cooling water at $0.10 per thousand gallons | 360.00 | 720.00 |
| Attendance labor | 1,050.00 | 1,050.00 |
| Total | $15,690.00 | $21,330.00 |
| Annual kilowatt-hours | 480,000 | 960,000 |
| Cost per kilowatt-hour | $0.0327 | $0.0222 |

In the cost comparison no mention was made of the costs for supervision. The operation of a 700-hp. Diesel engine plant would require a certain amount of some executive's time. A conservative value of the item of superintendence in this case would be $500 per year. It was pointed out that in considering the cost of operating an oil engine plant it should be remembered that there has been a decided upward trend in the price of fuel oil. This was shown in charts giving the posted prices of crude oil at the wells.

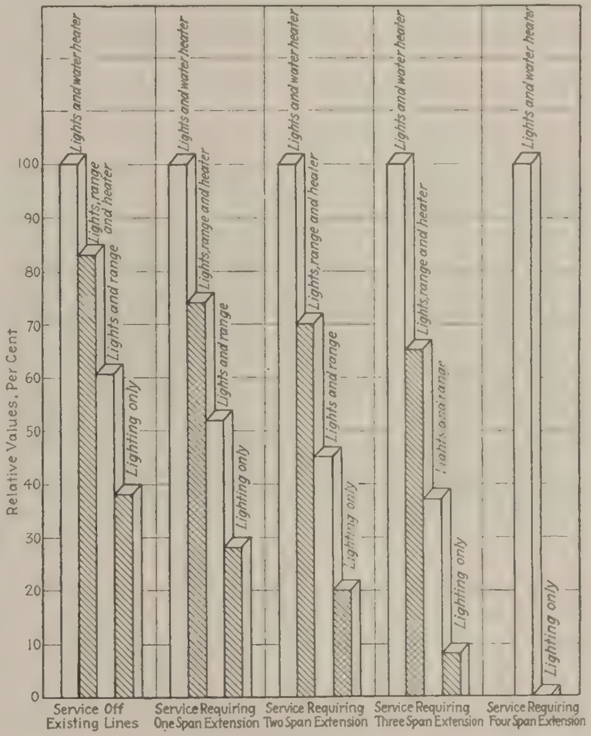
As a result of the investigation and comparison of costs, it was decided to purchase power and new contracts were accordingly signed.

# Relative Values of Different Classes of Residential Service

By D. F. McCurrach
*Rate Engineer Northwestern Electric Company, Portland, Ore.*

IN ORDER that salesmen and solicitors of residence business might be informed as to the relative values of different classes of residential business and also advised as to the decrease in value of business due to line extensions required, as compared with the same service rendered from existing distribution facilities, the Northwestern Electric Company, Portland, Ore., prepared the accompanying chart.

In order not to complicate the matter with allocation of power plant, transmission line, substation and distribution system investment, which, notwithstanding the number of theories advocated, must of necessity be arbitrary, the investment in the service, transformers, meters and the additional span costs alone were considered. The fixed charges on this investment were assumed at 15 per cent and the operating costs, such as cost of energy, operation and maintenance of meters, services, ranges, etc., commercial expenses and miscellaneous expenses, were assigned on the basis of average unit costs maintained by this company. On this basis a net revenue was obtained by deducting these costs from the gross revenue to be obtained by application of existing tariff rates. The ratio of net revenue to cost of extension was then obtained and each ratio expressed as a function of the most favorable condition, namely, that resulting from the greatest utilization of service from the existing distribution system, which has been plotted as 100 per cent value.



CONSUMER-VALUE CLASSIFICATION FOR RESIDENTIAL DISTRICTS UNDER SIMILAR CONDITIONS OF SERVICE

The chart is self-explanatory and shows comparative relative values for the classes of service shown. It is believed that this method, while probably not perfect, is a considerable guide and help to salesmen in visualizing the situation and realizing the importance of increasing the load of existing customers on existing lines, as contrasted with soliciting business that requires considerable distribution extension for small loads, the effect of which must of necessity have a material adverse effect on the net income.

## Bus Used for Appliance Demonstrations

THE Pennsylvania Edison Company is using a city type bus with seats removed to show the public the latest labor-saving household devices operated by electricity. The company does not solicit sales, but demonstrates the various machines on display. A desire is created in the minds of the visitors for a waffle iron, dishwasher or other appliance and a broader market for electric energy is produced. No prices are mentioned unless a direct request is made regarding a certain machine. In other words, the whole idea is to educate the public in the use of electricity and therefore increase the consumption of electric energy.

*Motor bus becomes an itinerant showroom*

An 8-gal. capacity tank underneath the vehicle supplies water for demonstrating the dish-washing and clothes-washing machines as well as an electric pump which is used to force the water into these machines from the tank. Among the various items exhibited in the bus are washing machines, an electric dishwasher, an automatic water heater, an electric range, and electric refrigerator, fans, waffle irons, percolators, small heaters, vacuum cleaners, and a sewing machine.

Power for the operation of the various appliances in the bus is taken from the company's service lines near the spot where the traveling exhibit is parked. A transformer has been installed on the back of the bus to take care of the energy requirements. When the bus is moving the lights use 12 volts direct current from the engine. When the exhibit is parked in a residential community power is supplied from the service line and the lighting supply is stepped down to 12-volt alternating current through a special transformer. The truck is a standard city type bus, six-cylinder model, a product of the Mack-International Motor Truck Corporation, altered by the addition of more lights, a water tank and a few power sockets. This traveling electrical exhibit before it gets back home this spring will have covered many communities in New Jersey, eastern Pennsylvania, southern New York and towns along the Atlantic seaboard.

# Letters from Our Readers

### *What Can Be Done for the Budding Engineer?*

*To the Editor of the* ELECTRICAL WORLD:

It is generally recognized that the successful professional engineer must have a fundamental engineering background, possess self-confidence, vision and the ability to write and speak forcible and convincing English, and exercise reasonableness in his dealings with subordinates.

What about the adolescent engineer, who has obtained the engineering fundamentals and knowledge of English in our colleges, but who has had no opportunity to realize that self-confidence, vision and reasonableness are essential in business? These aptitudes are not given in the college curricula, hence they must be obtained in the industry if we are to bring forward our future executive engineers.

Manifestly vision covers length and breadth of view, also correction of perspective. Length of view enables the engineer to judge the trend of events so that he may allow for the future. Breadth of view allows him to consider the problem from all angles. Correction of perspective permits its possessor liberty from prejudice and prevents him from enlarging on small matters, as well as making him think that the improbable is impossible. Correction of perspective makes him lean toward allotting his detail work to specialists, thus leaving the executive free to direct. These ideas may be given to the junior engineer in the form of guidance.

Self-confidence should not be confused with positiveness, for they are clothed much the same, but produce entirely different results. The self-confident man can be relied upon to have a large percentage of success in his problems and studies. In considering his few failures he has learned to investigate before making a decision, also to evaluate all factors concerning the problem and to distinguish the imperative from the nonessential, which he neglects. He realizes that when the job has been started it must continue, and that an alternative plan must not be considered unless pressure is brought to bear due to unforeseen obstacles. Before considering a job complete he reviews it, thus weighing his various ideas and factors governing its progress, and then ratifies or confirms them according to their relative importance. Accordingly, he knows how to attack a problem when it presents itself for solution and can therefore expect a reasonable amount of success.

But how can self-confidence be conveyed to the adolescent engineer? By a sympathetic superior. What more will retard self-confidence in the junior than to have his plans and ideas continually criticised and reected? It is, then, important, though often difficult, for the superior to conceive the idea that there are many logical ways of attacking a problem; further, he may be getting somewhat set in his methods and does not see that the original plan submitted by the junior may, once slightly reclothed, be better than his own. Considering the furtherance of self-confidence, it is often advisable to pass a reasonably good plan presented and let it be carried out, even when you know a better way. It is useful, though not flattering to your vanity, to guide the subordinate carefully until he suggests, as he thinks on his own initiative, the plan you desire to have followed.

M. D. S.

# Digest of Electrical Literature

## *Generation, Control, Switching and Protection*

*The Parallel Operation of Generating Stations.*—J. Defreyn.—The author has illustrated, by means of vector diagrams and charts indicating system and station operating conditions, a means of independent voltage regulation using the power factor. The problem of voltage regulation is stated to have been successfully solved in several ways, one consisting of the introduction into the circuit of an additional electromotive force which compensates either for the drop in pressure alone or also for the poor power factor resulting from the distribution of energy in the transmission lines and in the apparatus comprising the load. Such a result is obtained by means of the compounding of voltage regulators or by multi-tap transformers, boosting transformers, induction regulators or by rotary boosters. The placing of synchronous condensers in part of the networks is a common method of utilizing the second principle.—*Brown Boveri Review* (*Switzerland*), February, 1928.

*Electrical Engineering in 1927.*—A review of the developments in contemporary electrical engineering practice, including a reference to design improvements in iron-clad switchgear. It is stated in this review that outdoor iron-clad switchgear may now be obtained in England for potentials up to 220 kv. New designs combine the principles of compound-filled gear with the ordinary cubicle type layout, a device which is said to enable the engineers to inspect the isolating switch contacts and their operation, while at the same time each piece of apparatus is essentially iron-clad without intervening bare connections. The equipment is suitable for indoor or outdoor use and permits phase separation. Circuit breakers having a rupturing capacity of 1,500,000 kva. are now available in British manufacture.—*Engineer* (*England*), Jan. 13, 1928.

## *Transmission, Substations and Distribution*

*Arcing Tests on Cables.*—D. I. Fuchs-Kaufmann.—Wind or the sudden shedding of sleet may cause cables of an overhead transmission line to clash, causing destructive arcing. The authors investigated the durability of various types of cables when subjected to heavy arcs. A certain length of each cable tested was stretched out with a tension comparable to standard line practice. A copper block was fastened $\frac{1}{8}$ in. away from the cable and a single-phase short-circuit arc from a 750-kva. generator, corresponding to 350 amp. at 2,500 volts, was established between the copper block and the cable. Stop-watch timing was used from the instant of closing the breaker to the rupture of the cable due to melting. Two series of tests were made, with: (1) one end of the cable connected to the generator, and (2) both ends of the cable connected to the generator; the first series to resemble a single-way transmission line, the second series to imitate a ring or tie-line. Fifteen types of cables were tested, representing solid copper, solid aluminum, combination aluminum and steel, and hollow cables. Solid copper cables withstood longest, with copper alloy cables in second place, combination cables in third place and aluminum cables in the last place. Hollow cables lasted longer than equivalent solid cables. — *Elektrotechnische Zeitschrift*, Jan. 26, 1928.

*Overhead Transmission.*—G. R. Falkiner Nuttall.—A general consideration of the various factors utilized in the specification and design of overhead transmission lines. Among the factors considered are steel-core aluminum cables, progress in insulator design, reinforced concrete and galvanized steel structures, the determination of clearances, the spacing of conductors, the method of erection, and excavating practices. A tabulated record of contemporary transmission line practices in the United States is offered in connection with the discussion. The result of investigations upon the characteristics of porcelain in tension and a comparative estimate of the value of the several means of supporting the line are offered. —*Electrician* (*England*), Jan. 27, 1928.

## *Units, Measurements and Instruments*

*Daylight Recording by Means of the Photo-Electric Cell.*—L. R. Koller.—The recording of daylight intensity is another application of the photo-electric cell. This device, coupled to a suitable automatic recording instrument, offers a simple arrangement providing a means of great possibilities for investigating daylight conditions. The limitations of the usual photometer render the use of the photo-electric device of particular interest. — *General Electric Review*, February, 1928.

*Harmonic Analyzer for Use on Power Circuits.*—Rapid advances and refinements in the science of inductive co-ordination have made imperative the securing of accurate information concerning wave forms in both communication circuits and power circuits. An instrument which meets the requirements of portability and ease of operation without excessive cost has been developed, and while it is not offered as a perfect device it is believed that refinements have proceeded to a point where reasonably satisfactory results may be obtained. The analyzer consists essentially of a voltmeter capable of measuring the magnitude of any single-frequency voltage in the range of 60 to 3,000 cycles. Analyses of current are made by measuring the voltage drop across a resistance or inductive shunt. The sensitivity for current measurements may be increased by means of an input coil which is provided for the purpose. The apparatus is fundamentally a double-tuned circuit with single-stage vacuum tube amplification, the output of which is fed into a copper oxide rectifier. The rectifier current is passed through a direct-current micrometer, affording a direct reading of the measured voltage.—*Serial Report Inductive Co-ordination Committee, National Electric Light Association*, January, 1928.

## *Illumination*

*Lighting Measurement.*—G. W. Stubbings.—A discussion of the determination of the mean spherical candlepower by means of the Rousseau curve. The author has pointed out the desirability of utilizing this diagram in the determination of illuminating effect and points out that such a period does not meet all of the usual requisites and that a modification somewhat similar to the plan proposed by Dr. Rousseau has notable advantages.—*Electrical Review* (*England*), Jan. 20, 1928.

*The Effect of Different Systems of Lighting on Output and Accuracy in Fine Work.*—H. C. Weston and A. K. Taylor.—A joint report of the Industrial Fatigue Research Board and the Illumination Research Committee of Great Britain. A previous report embodied the results of an investigation into the optimum illumination required for typesetting by hand or composing in the printing industry and was limited to the study of adequacy in a quantitative sense, and no attention was paid to the almost equally important matter of distribution of light over the working area or, in other words, to the system of lighting tending to give the best results. The results of the experiments described are not so positive as those obtained by varying the degree of illumination provided, but, given sufficient illumination, there is no reason to expect that large differences either in output or accuracy would result in the different characteristics of most of the methods of lighting tried. It is stated that in some composing rooms general lighting may be unsuitable on account of structural features which will prevent the elimination of undesirable shadows, and in such cases the combination of general and local lighting in which the two types of source will give approximately the same proportion of the total illumination is to be recommended. Totally indirect lighting involves a loss of output but has the advantage of reducing the reflected glare on the type. It is stated that there is some evidence that the color of the light used in composing rooms may be of importance in relation to the question of glare, but that without further experiments no definite statements on this point can be made. Particulars of the installation relative to the output and comparison of morning and afternoon work under various conditions of illumination are described. — *Department of Scientific and Industrial Research (England)*, 1928.

## Heat Applications and Material Handling

*Large Electric Baking Ovens.*—W. Ellerd-Styles.—The progress that has been made in the development of small electric ovens in England is stated as being extensive, whereas larger installations have lagged behind in most instances. In dealing with the cost of operation the author states that the average consumption is about 90 watts per pound of baked bread. The various factors entering into the cost of electrical operation and the advantages attendant upon the use of this heating medium, as well as the features of automatic temperature control which have been provided for such installations and a consideration of the interest of the supplying utility, have been included.—*Electrician (England)*, Feb. 3, 1928.

*Large Pipe for High Head Made by Arc Welding.*—T. Ujiiye. — Electric welding was applied in the construction of a 1,942-ft. penstock of a Japanese hydro-electric development. The procedure under which the material was fabricated, the specifications under which the job was done, the anticipated advantages of welding construction, with particular reference to the present undertaking, and the duty requirements of the installation are given.—*Iron Age*, Feb. 16, 1928.

## Electrophysics, Electrochemistry and Batteries

*Some Principles Governing the Choice and Utilization of Permanent Magnet Steels.* — Raymond L. Sanford. — The addition of substantial percentages of cobalt to the composition of permanent magnet steel leads to markedly superior qualities. The cost of cobalt steels may be several times that of the older types and consequently their use is warranted only under certain conditions. Criteria for the comparison of magnet steels are discussed and conditions under which the use of the more expensive steels is justified are outlined. The author states that cobalt steels, while superior in quality to tungsten and chromium steels, may not display this superiority unless appropriate designs are utilized. Magnets may be stabilized against permanent deterioration from transient demagnetizing fields by partial demagnetization. The cobalt steels can be stabilized by this method to a greater degree than the steels having lower values of coercive force. In general, it is concluded that by the use of cobalt steels some results may be obtained which are utterly impossible with the tungsten and chromium steels more commonly employed, but that the economical justification for their use is not encountered except in cases where space or weight are of primary importance and cost is of secondary consideration or where particularly severe conditions must be met.—No. 567 *Scientific Papers of the Bureau of Standards.*

*New Type Storage Cell.*—L. Jumau. —When charged and then left idle for one year before it is discharged, the cell will give only 33 per cent less energy than if it had been discharged immediately after the charge, according to the author. The cells are made in three sizes, from 20 to 80 amp.-hr., and are completely sealed except for a self-closing gas vent. There are only two very thick plates in each cell, and the unusual charge-retention characteristics are due primarily to the exclusion of local chemical action in the plates. Exceptional purity of all active materials, a special form of the plates, very careful perforation and secure lodging of the plates in a grooved glass container are contributing factors. When used for signaling purposes, heating of filaments in radio tubes, electric clocks, etc., it was found satisfactory to charge such batteries only twice a year.—*Revue Générale de l'Electricité*, Dec. 3, 1927.

## Telegraphy, Telephony, Radio and Signals

*Television.*—A. Dauvillier. — In a series of three consecutive articles the author summarizes all the hitherto known and practically applied methods of transmitting an image over wires. Each method is described and illustrated with a sufficient amount of detail to comprehend its operating principles. The second part of the paper is devoted to an unusual X-ray method, utilizing the basic principles of television; that is, instead of subjecting the subject to a flood of X-rays and examining the shadowgraph on a fluorescent screen, the new method uses only a very small beam of X-rays, which is quickly moved over the examined area and is at the same time integrated again to give the complete image. This process is so fast that the object under examination may be in motion. Heart palpitation may thus be readily examined. Two great advatages are claimed for this new X-ray process: (1) The patient is subjected to only a fraction of the commonly required dose of rays, eliminating entirely the possibility of X-ray burns; (2) a much clearer image is obtained, since the veiling action of all secondary rays is eliminated.—*Revue Générale de l'Electricité*, Jan. 7, 14 and 21, 1928.

*The New York-London Telephone Circuit.*—S. B. Wright and H. C. Silent.—The special provisions which are in use on the transatlantic telephone to compensate for the variability of the wire and ether paths, for the radio noise and for the fact that two-way transmission is effected upon a single wave length is discussed in this paper. Technical operators are in attendance at each end of the radio path and are equipped to adjust the magnitude of the speech currents entering the radio transmitters to such a value as to load these transmitters to capacity. The amplification introduced at the radio receivers can also be adjusted to compensate for changes in the transmission efficiency of the radio paths. Finally, voice-operated relays together with suitable delay circuits are provided which so control the apparatus that at any given time it can transmit in but one direction. By this arrangement, a speaker's voice upon leaving his transmitting station cannot operate his own receiver, although this is tuned to the transmitting wave length.—*Reprint B-275 Bell Telephone Laboratories, Inc.*

## Traction

*Electric Snowplow.*—An electric rotary snowplow has recently been installed on a section of the Swedish State Railway lying above the Arctic Circle. Because of the extreme climatic conditions special precautions were necessary in the design of this equipment. The snowplow is not provided with motive power, but is pushed from behind by an electric locomotive which may be controlled from the driving cab of the snowplow. The motor for the operating of the plow-wheel shaft has a rating of 565 hp., but may be momentarily overloaded by 100 per cent. The motor is a series-wound, single-phase device of the same type and appearance as those used for electric locomotive drives. The motor is placed longitudinally and is provided with a cast-steel stator frame bolted to the bedplate. The plow-wheel shaft is driven through a helical single reduction gear. The gear pinion is combined with a brake drum and against this two brake blocks can be pressed, the operating force being secured by the use of air pressure so that both the rotor and plow wheel may be braked at the same time.—*Electrician (England)*, Jan. 20, 1928.

## Miscellaneous

*The Maclaurin Smokeless-Fuel Plant at Glasgow.*—The design and construction of a plant for the production of smokeless fuel is offered in this article. The producer unit bears some resemblance to a blast furnace, although it is square and raised above the ground on piers. A center wall near where the air ports enter divides the producer into two large chambers, while higher up are an oil trap and a gas and oil outlet. The coke, after cooling, is discharged through chutes at the bottom of the producer. The operation of the plant is referred to in considerable detail.—*Engineering (England)*, Feb. 3, 1928.

## New San Francisco Rates

*Domestic Customers Will Pay Monthly Service Charge of 40 Cents Plus Energy Charge Beginning at 5 Cents for First 200 Kw.-Hr.*

REDUCTIONS in the electric light and power rates of the Pacific Gas & Electric Company and the Great Western Power Company, representing a saving to consumers of nearly $2,000,000 a year, briefly referred to last week, have been approved by the Railroad Commission of California in a decision giving the consumers the immediate benefit of the reduced rates. The commission has, however, continued for further hearing and final determination the various rate proceedings relating to those two companies which have been pending before it as the result of complaints by various cities and on the commission's own investigation.

In addition to authorizing the reductions proposed by the power companies affecting residential and general power and light consumers, the commission ordered a revision of agricultural power rates the net result of which will be a saving of approximately $65,000 to that class of consumer. The change in agricultural rates was ordered by the commission in response to the plea of the California Farm Bureau Federation for a new agricultural pumping service rate which would eliminate optional rates now in effect, open the schedule to new types of service and effect a general reduction, although increasing the bills of a few consumers.

The principal effect of the proposed changes in the general and domestic electric rates will be a lowering of the lighting rate to the lowest point yet reached in the territory of the companies involved and the establishment of extremely low rates for the operation of electrical appliances and household devices. The reductions applicable to general lighting service, including household appliances and small power service, became effective for meter readings on and after March 1, and the reductions in the general power and agricultural rates and the new combination domestic service rate will be effective on and after April 1.

The new domestic rates in San Francisco, Oakland, Berkeley, Piedmont, Emeryville, San Leandro and Albany are as follows: Service charge per meter per month, 40 cents; energy charge (to be added to service charge), first 200 kw.-hr. per meter per month, 5 cents; next 800 kw.-hr., 4 cents; next 2,000 kw.-hr., 3 cents; all over 3,000 kw.-hr. 2½ cents. In incorporated cities served by the companies outside those above named the rates will be the same except that the service charge will be 50 cents. In unincorporated territory the service charge will be 70 cents and the energy charge for 200 kw.-hr. 6 cents, for the next 800 kw.-hr. 5 cents; for the next 2,000 kw.-hr. 4 cents, and for all over 3,000 kw.-hr. 3½ cents.

The general domestic combination service rate in San Francisco, Oakland, Berkeley, Piedmont, Emeryville, San Leandro and Albany will be (with extra charges where there are more than six rooms or where devices rated at more than 1 kw. are installed): Service charge per meter per month, 40 cents; energy charge, first 30 kw.-hr., 5 cents; next 140 kw.-hr., 3½ cents; all excess, 1½ cents.

## Engineers Will Honor Dr. Cornelis Lely of Holland

Engineers will honor Dr. Cornelis Lely, president and honorary member of the Netherlands Royal Institute of Engineers and member of the Royal Academy of Sciences, at a luncheon to be given at the Engineers' Club on Tuesday, March 6, at 12 o'clock. This luncheon will be under the auspices of the American Society of Civil Engineers, the American Institute of Mining and Metallurgical Engineers, the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. Dr. John R. Freeman will preside.

---

## Amendment to Norris Resolution Favored

### Harrison's Plan Vests Question of Government or Private Operation of Muscle Shoals in Secretary of War—Federal Trade Commission Ready to Subpoena

By Paul Wooton

*Washington Correspondent of* ELECTRICAL WORLD

MUSCLE SHOALS legislation which is fairly acceptable to the opponents of the government's entering business apparently is about to be approved by the Senate. As this is written, it seems probable that the Harrison amendment to the Norris resolution will be adopted. The Norris resolution requires that the power plants be operated by the government, which is to sell energy to "states, counties, municipalities, corporations, partnerships or individuals," giving preference to states, counties and municipalities. The Harrison amendment vests in the Secretary of War the decision as to whether the power plants are to be leased to private operators or are to be operated by the government. In the event of government operation of the dam and steam plant, however, no municipality may receive a greater amount of power than it is entitled to receive under the principle of equitable distribution for which the amendment stands, and all power sales are confined to the switchboard. The Harrison amendment also provides that the energy is to be sold for public use subject to state regulation.

The theory of the Norris resolution, as well as of substitutes proposed by Senator Tyson of Tennessee and by Senator Sackett of Kentucky, is to separate power and fertilizer production. This is in line with the view of the majority of the members of the Senate. In each of these measures the proceeds from power are to be used for a period of years in an effort to demonstrate the practicability of the use of air nitrogen as a fertilizer ingredient. In addition, experiments are to be conducted in the production of phosphoric acid and other ingredients of fertilizers in an attempt to devise means of reducing production costs. It is the conception of these three bills that a considerable part of the money, however, shall be used to conduct on farms practical demonstrations of concentrated fertilizers.

All of the proposals authorize the Secretary of War to enter upon transmission-line construction in order to place him "upon a fair basis for making contracts and for receiving bids." Proceeds from the sale of power may be used for that purpose without additional authority from Congress. The Norris resolution authorizes additional equipment for the dam and for the steam plant. This equipment, it is estimated, will cost in excess of $10,000,000. The Harrison amendment does not modify the Norris resolution in that respect.

It is generally conceded on the House side that the Madden bill is dead. Apparently a majority of the House military affairs committee now favors the Morin bill, which is very similar to the Norris resolution. It is believed that the Norris resolution, as amended, will be just as acceptable to the House committee, but no decision has been made as to which of the two bills will be pushed by the House committee.

The Federal Trade Commission is about to decide upon the form its investigation of the electrical and gas industries will follow. The adoption of this plan has presented numerous difficulties, as have the questions involved in the subpœnaing of witnesses. As this is written, it is expected that the subpœnas will go forward within a few days. As a result of the publicity given the utilities investigation, the commission has been deluged with applications for employment from persons who state that they are particularly qualified to be of assistance in such work. It became necessary for Chairman Humphrey to issue a public statement pointing out that the commission has received no extra appropriation for this investigation and at present expects to proceed with the inquiry without additions to its regular staff. Numerous engineers and economists were among the applicants.

## La Guardia Bill to Limit Federal Court Jurisdiction

Congressman F. H. La Guardia of New York has again introduced his bill to restrain the United States courts from setting aside orders made by state public service commissions concerning the operation or rates of public utility companies until the state courts have passed upon the points at issue. This is the third time that he has fathered this bill, which is similar to one formerly championed by Congressman Bacharach of New Jersey. Mr. La Guardia has issued a statement denouncing federal court findings in the New York City gas cases and asserting: "It was never intended that United States district courts should intervene in the first instance to permit public utility companies disregarding law or obligations under contracts. The custom now has become so general, the power of traction and other public utility companies so great, the exploitation of the people so ruthless, that Congress must step in and curb this evil."

## Legislator Questions Rates in Boston and Near By

H. L. Shattuck, a member of the Massachusetts House of Representatives, has filed an order asking the Department of Public Utilities to inform the House not later than March 15 whether the commission favors making inquiry with the object of bringing substantial reductions in the rates of the Boston, Lowell, Lawrence, Lynn, Fall River, New Bedford, Malden, Quincy and Brockton companies, and also whether the Boston Edison company's maximum rate of 8½ cents per kilowatt-hour is in part due to the extension of the company's service into sparsely settled territory, and whether the establishment of a zone system of rates is advisable in order that the congested portion of the area served may obtain a rate which takes into account the lower cost of serving that part of the territory.

# Men from Four States at Albuquerque

### Thoroughly Practical Three-Day Convention of New Mexico Utilities Association Appeals to Executives of Rocky Mountain Region and Western Texas

MEN from Colorado, Wyoming, New Mexico and Texas were in attendance at the thirteenth annual convention of the New Mexico Utilities Association, which was held at the Franciscan Hotel in Albuquerque on Feb. 20-22. J. B. Ledlie, Mesilla Valley Electric Company, former president of the association, reviewed its past accomplishments and outlined future opportunities. Sales efforts, he said, are of immediate importance and "our biggest job."

Miss Frances B. Ryder, chairman of the women's committee, Rocky Mountain Division, N.E.L.A., painted a picture of the increasingly large and important part that women are taking in the field of public service. Dr. James F. Zimmerman, president of the University of New Mexico, outlined difficult problems in the field of education. "Public Relations—the New Concept" was the subject of V. L. Board, general superintendent Public Service Company of Colorado. Mr. Board thought that prejudice against the public utilities is largely inherited and can be dissipated by education.

A. R. Woolley, Edison Electric Appliance Company, Denver, spoke on "Central-Station Merchandising from the Standpoint of the Manufacturers." He asked whether the utilities are analyzing the merchandise they offer from the standpoint of its dependability and the integrity of its manufacturer. H. B. Dwight, engineer for the Colorado Public Utilities Commission, took up public relations, which, he said, are "nothing more than public confidence, and confidence can be established in a large measure through the proper training and education of employees." "Why All the Secrecy?" was the question asked by George E. Lewis of the Rocky Mountain Committee on Public Utility Information. Mr. Lewis insisted that utility managers let their employees in on the results obtained from conventions such as the one in session.

J. J. Cooper of the Mountain Electric Company, Denver, had for his subject "What Price Success?" He outlined the "new competition" and emphasized the necessity for intensive market development. H. C. Webb, Jr., sales manager El Paso (Tex.) Electric Company, pointed out that production problems have received far greater attention than those related to merchandising. He told of an experiment his company is now trying which calls for the establishment of district representatives for all residential territories within the city. These men have approximately 900 customers each and are doing the combined work of meter reader, salesman and collector.

Tuesday morning's session was given over to a complete discussion of the Colorado River development. Following a brief review of the situation by Merrit C. Mechem of Albuquerque, Francis C. Wilson of Santa Fe, Colorado River commissioner for New Mexico, explained the many features of the proposal in detail and prophesied practical reconciliation of the various opposing factions.

"Central-Station Possibilities in Street and Highway Lighting" was handled by A. S. Anderson of the General Electric Company, Denver. Philip S. Donnell, dean of engineering, University of New Mexico, presented "The Problem of Power Factor." Its technical side has been taken care of, he asserted, and it now remains for the utilities to convince the consumer. Recent engineering developments in the electrical industry were described by R. W. McNeill, Westinghouse Electric & Manufacturing Company, Denver, who dealt with steam-turbine construction, synchronous motors, electric house heating, transportation, transmission equipment and automatic substations.

A. C. Cornell of the Graybar Electric Company, Denver, talked on "Possibilities of Developing an Electrical Consciousness." Of commercial managers he said: "Five-thousand-dollar-a-year executives are expected to do the work that should be done by fifteen-thousand-dollar men."

Officers elected to serve the New Mexico Utilities Association for the ensuing year are: President, C. C. Ogle, Agua Pura Water Company, Las Vegas; first vice-president, W. W. Nielson, Santa Fe Water & Light Company; second vice-president, C. S. Makeig, Roswell Public Service Company; secretary-treasurer, B. L. Wiles, Albuquerque.

## Northern States Power Budget Includes New Offices

Construction of a twelve-story downtown office building in Minneapolis is one of the major projects of an eight-million-dollar budget for this year which has just been announced by Robert F. Pack, vice-president and general manager of the Northern States Power Company. Work is to be started on the new structure May 1. It will be built at 21 Fifth Street, South, to make a part of the present structure adjoining at 15 Fifth Street, South, and seven additional stories will be added to the newest five-story unit of the old building. The building is to be ready for occupancy May 1, 1929. The power company will occupy ten floors of the new addition and the remainder will be available for rental to electrical firms.

The second largest item in the 1928 budget is one, already noted, of about $1,500,000 for the completion of the company's hydro-electric plant and dam at Chippewa Falls, Wis. Nearly $1,500,000 has been spent already on this development, which is to be ready for service next September. The program further includes betterments and expansions of both production and distribution facilities in five states—Minnesota, North Dakota, South Dakota, Illinois and Wisconsin. Several new substations are to be built, and it is estimated that more than 200 miles of cable and conduit will be installed, to replace present equipment and for extensions to the company's lines. In the Minneapolis area heavier cables and larger vaults will be installed in the downtown district and an additional feeder built from the Aldrich Avenue substation to the "Loop" district. In St. Paul a second bank of 15,000-kva. transformers will be installed at the High Bridge plant. Improvements to the electrical systems at Grand Forks, Fargo and Minot, N. D.; Sioux Falls, S. D.; St. Cloud, Stillwater, Mankato and Red Wing, Minn., and Eau Claire, Wis., also figure in the program, and a 35-mile, 11,000-volt transmission line will be built from Clara City to Cosmos, Minn.

## Referendum Versus New Power Survey

*Partisan Gestures on St. Lawrence Development Indulged in by Both Sides at Albany—Savings Banks Investment Bill Reintroduced*

A NEW proposal on St. Lawrence River water power from Governor Smith of New York is now before the Legislature in a bill introduced by the leaders of the Democratic minority to hold a referendum at the general election next fall on the question of whether the state's remaining water-power resources shall be developed by a state Power Authority, as advocated by the Governor, or by private corporations under leases, as urged by the Republicans, who control both houses at Albany.

This proposal has been met by the Republicans by the introduction of a water-power bill along the same lines as one passed by them last year and vetoed by the Governor. It provides for an impartial commission of five members to make a survey of the state's water-power resources and the best method of developing them. It is reported that all the Republican senators have been pledged by caucus action to support this measure.

The bill to amend the savings banks investment law so as to permit these institutions to invest in the bonds of certain electric, gas and telephone companies which meet specified requirements has been reintroduced in the Assembly and referred to the committee on banks. This measure was defeated last year in the Assembly by 85 to 49, and so far the prospects for its passage at this session do not seem hopeful.

Assemblyman Hearn of Brooklyn has introduced a bill amending the Public Service Commission law by empowering the commission to require every gas and electric corporation to publish proposed changes in rates in a daily newspaper. At present the only publication, except as news, is by a tariff filed in the office of the corporation which may be inspected by the public.

Under the provisions of a bill introduced by Senator Brereton of Essex County the Public Service Commission law would be amended by giving to the commission supervision over a corporation or person controlling through lease, voting trustees or operating contract a corporation subject to jurisdiction of commission or which furnishes products or service to such corporation for ultimate distribution to the public. A similar bill failed of passage last year.

## Beacon Lights of Great Size Continue to Be Installed

An aeronautical beacon of more than 1,000,000,000-beam-candlepower rating is to be placed on a 1,320-ft. tower in the "Loop" district of Chicago, according to Paul Henderson, vice-president and general manager of the National Air Transport, Inc., which operates the Eastern division of the transcontinental air mail between New York and Chicago. Elmer A. Sperry, head of the Sperry Gyroscope Company of Brooklyn, has donated the light to Chicago, and a survey is under way to select the site for the tower, which will be built on one of the high buildings in the "Loop."

Herbert Photos Inc.

AIR BEACON ON HOTEL ST. GEORGE, BROOKLYN, RATED AT 480,000,000 BEAM CANDLEPOWER

The new light will have a lens and reflector 63 in. in diameter and will project a revolving five-foot beam. The power plant, tower and installation of the light will cost about $2,000,000.

A new airplane beacon erected last week on the roof of the St. George Hotel, Brooklyn, has 480,000,000 cp. and is said to be the largest beacon ever built for private use. Two revolving beacons now being erected in California by the Standard Oil Company for the guidance of West Coast fliers develop 10,000,000 cp. each. One will be placed on top of Mount Diablo, 25 miles southeast of San Francisco, at an altitude of nearly 4,000 ft. and will be visible from points within a radius of 100 miles. The other is to be among the Merced Hills in the Los Angeles basin, just north of Montebello. It will be similar to the Mount Diablo installation. The standard revolving beacons on the night air-mail routes in the United States, which are visible for 40 miles or more, are of 2,000,000 cp.

## White River Conflict Is Probably Adjusted

*Federal Power Commission May Now Act on Application for Plant in Arkansas, but Situation on Missouri Application Is Still Blocked*

THE Ozarks Hydro-Electric Company has withdrawn its application to the Federal Power Commission for a preliminary permit covering the 200,000-hp. project on the White River near Cotter, Ark. The commission now is in a position to act promptly on the conflicting application of the White River Power Company. This marks a definite step in a project which has been through many vicissitudes. Since the defunct Dixie Power Company received a preliminary permit for it following the first application made under the water-power act eight years ago. The project is related to that on the upper White River, across the line in Missouri, where the Empire District Electric Company has applied for a license covering an 80,000-hp. project at Table Rock. In this case the commission is withholding action on the application because of the opposition of the authorities of Stone County, Mo. The local officials are insisting that the power company build a bridge, which would cost in excess of $500,000, over its reservoir.

An unfavorable report on the proposed development at Wolf Creek, on the Cumberland River, in Kentucky, is understood to have been approved by the Chief of Engineers. The report is said to indicate that the project is not feasible under market conditions prevailing in the area or likely to prevail for a long period. With this report in hand it is believed that the commission will act in the near future on the application of the Cumberland Hydro-Electric Company proposing the utilization of the power resources of Cumberland Falls—the development that has been so strenuously opposed by those who contend it will mar the natural beauty of the Cumberland Falls.

A license has been issued to Henry V. Gates for a small project on Crooked River in Oregon. The license is of particular importance, however, because it contains a clause subordinating the use of the water to any future irrigation requirement. This is the first time that such a provision has been written into a license.

The Starr-Collinson Packing Company of Portland, Ore., has applied for a minor license for a project on an unnamed creek tributary to North Arm of Moira Sound, Prince of Wales Island, Alaska; the Feather River Trust of San Francisco, Calif., for a minor license covering a project on Dogwood Creek, Plumas County, and the California-Oregon Power Company for a license covering a transmission line 25 miles long from its Chiloquin substation to Fort Klamath.

## News from the Dominion

*Bill to Prohibit Exportation of Power Introduced at Ottawa—Dispute with Provinces Over Federal Rights Continues—Alarmists Take the Floor*

ACCORDING to Charles Stewart, Minister of the Interior, it is the opinion of the Canadian government that export of electric power should be prohibited. The Minister made this statement during a discussion of a bill to regulate the exportation of electric power which is now before the House of Commons at Ottawa. The purpose of the bill is to make the export of electric power subject to an act of Parliament, instead of leaving it in the hands of the government.

At the opening session of the Ontario Legislature Premier Ferguson dealt at length with the dispute between the Dominion and provincial governments over power rights. The reference recently taken by the federal government to the Canadian Supreme Court concerning power rights had been undertaken without consulting the provinces, after it had been agreed at the interprovincial conferences in January that both interests should be consulted on the questions to be submitted, the Premier stated. The questions submitted by the Dominion were vague, indefinite and general, and the Premier doubted if any court would answer them. It came as a distinct surprise to him when the reference was announced.

Quebec power interests have failed in their efforts to secure a measure of relief from the Dominion government in respect to income tax as applied to users of electrical energy in that province. The annual budget of that government has been brought down and there is no provision in it dealing with this question.

To renew public agitation in favor of construction of the Georgian Bay canal as opposed to the St. Lawrence waterway project is the expressed object of the Montreal Chamber of Commerce. This body at a recent meeting decided to study the all-Canadian plan again, to invite an engineer of authority to speak on the subject and to approach members of Parliament. One member said that, whereas the St. Lawrence waterway might cost anywhere from a billion and a quarter to a billion and a half dollars, it was known that the Georgian Bay project would cost only $150,000,000. It would also furnish a million horsepower to Ontario.

An ostensibly serious warning has been sounded by John R. Robinson, editor of the *Evening Telegram*, Toronto, that the Hydro enterprise of Ontario is in grave danger of being absorbed by international capital and private ownership. According to him "the interests" are fighting to remove from their path the "menace" of people's power. Attacking the "electric ring" of the United States and Canada and Sir Herbert Holt, Montreal financier, Mr. Robinson declares: "I fear some of you will live to see the day when the whole Hydro system will be sold out to private corporations."

Another alarmist is James H. Hunter, vice-president of the Engineering Institute of Canada, who urges that control of the Canadian sections of the St. Lawrence River should be kept by Canada and should not be risked in an international arrangement with the United States. Mr. Hunter holds that the upper, or Morrisburg, part of the project could be put through immediately by Canada and 300,000 hp. readily absorbed by the Hydro-Electric Power Commission. The second development, at the foot of the Long Sault rapids, should be undertaken only when Canada can utilize the power to which it would be entitled, about 700,000 hp., he says.

## Commonwealth Edison to Spend $27,346,000

All the proceedings of the annual meeting of Commonwealth Edison Company stockholders, held in the Edison Building, Chicago, on Feb. 27, were, as has been the custom for a number of years, broadcast by radio for the benefit of the thousands unable to attend. President Samuel Insull in his official address put the number of stockholders at more than 40,000 and the company's customers at 906,000. Total business in 1927 was $71,629,000. Mr. Insull continued:

> We have spent during the year 1927 in additions for plant and distribution system $26,057,000, and we figure it will be necessary to spend in the year 1928 $27,346,000 for the same purpose. Thirty-three per cent of the energy that we put out last year came from our new Crawford Avenue plant. In 1927 the largest turbine we have, at Crawford Avenue, has a capacity of 88,000 kw., and the total capacity of all our stations is 1,042,000 kw. Before this year closes we shall have a turbine in operation at Crawford Avenue station that will have a capacity of 100,000 kw., and we shall have a total station capacity in all our stations of 1,053,000 kw. In 1927 our load factor was 48.4 per cent as compared with 47.9 per cent in 1926. Our total output is about 5 per cent of the total output of electrical energy for the entire United States, figured on the basis of a population of 3,100,000, which is about 2½ per cent of the total population of the United States. It is a very proud boast of the personnel of the Commonwealth Edison Company that it has never raised its rates.

After referring to the change in the company's method of billing for energy consumed, which was explained in the ELECTRICAL WORLD for last week (page 419), Mr. Insull went at some length into the Chicago transit situation, in which the Commonwealth Edison through a subsidiary is interested, and declared: "If I am going to be the subject of constant public attack, I shall personally withdraw from all effort to bring about a merger of the various traction properties and content myself with just looking after your interests in the Chicago Elevated Railways."

Samuel Insull, Jr., was elected as a director to succeed the late Watson Blair.

## High-Frequency Freaks

*Unusual Results Follow Experiments with a Tube Recently Developed in the General Electric Laboratory at Schenectady*

EXPERIMENTS with a new type of high-power short-wave tube recently developed by engineers of the General Electric Company laboratories at Schenectady, N. Y., have produced results of an unusual and decidedly interesting character.

Those in control of the experiments report that meters in adjacent rooms have run wild, that delicate measuring instruments have been twisted or broken, that the new apparatus has emitted a warm glow subjection to which has been followed by increasing pain in limbs and joints, that rats in a cage placed close to the radiating wire have become excessively animated and then, if exposed too long, have died, that a new incandescent lamp has been lighted to full brilliancy without wires or socket, that a cold copper bar lying on the floor has blistered the hand of a man picking it up, that a neon tube has suddenly flooded the room with its glow when merely touched, that simple food has been cooked in a glass tube suspended from a receiving aërial, and that many less spectacular effects have been experienced.

The vacuum tube, 5 in. in diameter and about 2 ft. long, is inclosed in a wooden cage and surrounded by a network of wires, condensers and meters. The tube operates as a self-excited oscillator on a wave length of 6 m. and is capable of radiating from 10 kw. to 15 kw. of high-frequency power—probably fifty times as much as any short-wave tube has heretofore been able to produce. The tube is connected through a coupling system to a copper bar approximately 3 m. long, which constitutes the tuned aërial circuit, and is able to radiate into space the full 15 kw. generated by the oscillator.

Most striking of the short-wave effects was the standing electric arc, a close imitation of the famous ball of fire reputed to accompany tropical thunderstorms. The operator touched the end of the radiating aërial with a metal-tipped pole, and immediately a greenish white arc arose to a height of a foot or more. When the pole was removed the arc remained, like a plume of fire, sputtering and sending molten copper in all directions until blown out. By skillful manipulation as many as three of these arcs were established simultaneously along the aërial, giving the appearance of a row of flaming gas jets. Smaller standing arcs of this nature were established on the ends of a receiving aërial several feet from the radiating system, demonstrating the transmission of power currents through space.

Experiments of the same nature are known to be under way also in the laboratories of the Westinghouse Electric & Manufacturing Company, wave lengths of 1½ m. being employed for the purpose.

## Purchases and Mergers

*American Gas & Electric Buys Princeton (W. Va.) Power Company—Little Rock Municipal Plant May Be Sold to Arkansas Power & Light*

THE American Gas & Electric Company, of which the Appalachian Electric Power Company is a subsidiary, has purchased the electric light and power property of the Princeton (W. Va.) Power Company for a sum said to be around $700,000, and the contract has been ratified by the stockholders of the latter. The Princeton Power Company had divorced its light and power business from the street railway, and all the street-railway property was conveyed to the Tri-City Traction Company, a corporation formed among the old stockholders.

Negotiations for the sale of the Little Rock city power plant, now operated to furnish power for the street-lighting system, to the Arkansas Power & Light Company, provided that company makes a satisfactory rate for street-lighting service, are under way. This plant has been valued at prices ranging from $150,000 to $200,000.

The sale of the Yellville (Ark.) lighting plant to the Arkansas Power & Light Company is thought to be a preliminary step to bids for the smaller plants between Batesville and Yellville, which would give an unbroken chain to the contemplated dam on the White River site which the company bought a year ago. It is reported that negotiations are under way by the Couch interests to buy the plants at Calico Rock and Cotter, but sales are not closed.

Transfer of the capital stock and properties of the Clear Spring Electric Light & Power Company and the Potomac Light & Power Company to the Potomac Edison Company of Hagerstown has been authorized by the Maryland Public Service Commission. For the Potomac Light & Power Company's stock the Potomac Edison paid $106,000, the par value.

Approval of the Maryland commission has also been given to the transfer to the Consolidated Gas, Electric Light & Power Company of Baltimore of all property and assets of the twelve subsidiary companies referred to last week.

The Interstate Public Service Company has filed a petition with the Indiana Public Service Commission asking authority to buy for $97,500 properties in Johnson, Shelby and Bartholomew Counties, with a combined valuation of $110,000. Transmission lines near Columbus, Ind., owned by the H. F. Clevenger Electric Company; the Winterrows transmission lines near Flatrock and the Trafalgar Light & Power Company of Johnson County are the properties.

A special election will be held in Rochelle, Ill., March 26 on a proposal of the Federal Public Service Company of Chicago to purchase the Rochelle municipal electric plant and properties and water system for $500,000.

Purchase of the Adrian, Burnside, Colusa & Ferris Light & Power Company properties in Hancock County, Ill., for $34,050 by the Central Illinois Public Service Company has been authorized by the Illinois Commerce Commission.

Electric transmission lines east from Lake Park to Lake Okoboji, Iowa, have been purchased from the Central States Electric Company by the Northwestern Light & Power Company.

The Otter Tail Power Company has been authorized to purchase the electric property at Wilton, N. D., from the Washburn Lignite Coal Company.

The Western Public Service Company has purchased the municipal lighting plant at Ogallala, Neb. The Iowa-Nebraska Light & Power Company has purchased distribution systems at Burchard and Steinauer, Neb., and a transmission line from Dubois. These towns have been buying from the municipal plant at Pawnee City.

Approval has been granted by the Kansas Public Service Commission for the sale to the Kansas Power & Light Company, Topeka, of the electric distribution system and transmission line of the city of Huron.

The Tennessee Railroad and Public Utilities Commission has approved the purchase by Frank A. Reid from T. G. Avery of the electric distribution system in Halls and Gates and the transmission line connecting the two towns for $52,000.

Negotiations between the Southern Cities Utilities Company of Chattanooga and Tullahoma (Tenn.) representatives for the sale of the municipal electric plant and waterworks at Tullahoma to the company are in progress.

Crystal Springs (Miss.) municipal authorities are considering the sale of the water and light plants for $145,000 cash to Kulley & Williams of Jackson, who have applied for a charter under the name of the Mississippi Utility Company.

It is reported in San Francisco that H. M. Byllesby & Company are negotiating with the Snow Mountain Water & Power Company for the purchase of its properties in the Ukiah and Lake Pillsbury section.

Sale of the Laurentian Power Company to the Quebec Power Company has been approved by the shareholders of the Laurentian. The Quebec Power Company will thus come into possession of a 30,000-hp. development on the St. Anne River, with a 40-mile high-tension line to the city of Quebec.

Senator Walter Schlosser of Grand Forks, N. D., head of the Northern Light & Power Company, has just made an offer of $140,000 to the town of Estevan, Saskatchewan, for the power plant recently erected there. His proposal is to build a central power station at Estevan, using lignite coal for the supply of electric power to southern Saskatchewan.

## Program for Policies Division of the N.E.M.A.

Definite action on the matter of an "all-electrical industry show," on tariff matters and on adequate statistics is expected at the spring meeting of the Policies Division, National Electrical Manufacturers' Association, to be held on March 14-16 at the Edgewater Beach Hotel, Chicago. A request for definite support of the program of the Industry Sales Conference will also be presented. N. A. Wolcott, chairman of the N.E.M.A. committee on codes of ethics and sound merchandising principles, will discuss that subject at the first general session. Other speakers scheduled are R. J. Russell, Century Electric Company, who will discuss "Terms of Payment," and W. S. Rugg, Westinghouse Electric & Manufacturing Company, who will talk on "Minimum Standards of Performance for Electrical Products" at the second day's session. "Cost and Channels of Distribution" is scheduled for general discussion following Mr. Rugg's address.

## Portland Has Commercial Meeting

*Range Sales, Appliance Merchandising and Electric Refrigeration Discussed by Members of the Northwest Electric Light and Power Association*

COMMERCIAL leaders of the Northwest Electric Light and Power Association gathered at Portland, Ore., on Feb. 20 and 21 for the annual midwinter meeting of the Commercial Section and, under the chairmanship of J. C. Plankington, discussed reports of the year's work. The lighting committee showed that much is being accomplished in bringing about better lighting in the factory, store, office and home through the presentation of lighting talks and demonstrations before luncheon clubs. Twenty-nine talks in all will be given by the committee this year. Work of the street and highway lighting committee centered on the job of compiling data to show street-lighting costs per capita, percentage of street-lighting costs to police expense, etc., to be used as sales material in the case of municipalities.

A survey made by the commercial cooking committee to determine the cost of electrical energy per unit of output will aid salesmen in obtaining more of this class of business. The competitive power committee found that, even with the very low prevailing prices of wood waste, many woodworking plants are finding it economical to purchase central-station service. Moreover, the increasing use of stoker-fired wood waste in household furnaces is providing a market for wood refuse.

One of the things the electric range committee expects to accomplish is to replace obsolete electric cooking equipment in the domestic science departments of schools and universities with modern equipment. Special sales versus continuous selling came in for considerable discussion, and it was quite generally agreed that the greatest volume of sales will result from following the vogue of the times—the special sale.

Figures compiled by the merchandising committee on sales of small appliances led the committee to conclude that insufficient effort has been placed upon this form of merchandising. Several told of company policies to assist dealers in every possible way to tie in with the central station on appliance sales. A general discussion of electric refrigeration showed that the servicing problem is causing power companies less concern, owing to better product and the larger distributors' policy of maintaining a well-trained and efficient service organization of their own. Some power companies have been successful in establishing a policy of passing service charges on to the customer, and several felt that this is the solution to the servicing problem.

# Briefer News

Ready to Build Martin Dam Transmission Line.—By an order of the Alabama Public Service Commission just issued the Alabama Power Company is authorized to construct a transmission line from Martin Dam to the Alabama-Georgia line, a distance of 46 miles. Work will begin in a short time.

New Substation at Pulaski, Va.—Among structures lately completed by the Appalachian Electric Power Company is the Pulaski (Va.) 7,800-kva. substation, which is fed by two 88-kv. transmission lines, one from Byllesby and the other from Glen Lyn. A 33,000-volt bus feeds three outgoing lines, one extending to Radford and Christiansburg, another serving Dublin, Belspring and several mines, and the third to supply the Empire mines.

"White Ways" for Miami and Little Rock.—A "white way" is to be installed in the business district of Miami by the Florida Power & Light Company. It will consist of 197 400-cp. ornamental lamps and four of bracket type. A new "white way" installed by the Arkansas Power & Light Company at Little Rock, Ark., on Louisiana Street, comprising 32 ornamental posts surmounted by 1,000-watt lamps, makes that the brightest street in the city.

Northwest Engineering Section Program.—The program for the fifth annual meeting of the Engineering Section, Northwest Electric Light and Power Association, to be held at Spokane, Wash., on March 8 and 9, includes, besides many technical committee reports with a wide purview, addresses by Major H. S. Benion, N.E.L.A., and E. C. Stone, chairman Engineering National Section, N.E.L.A. An illustrated report of the Lake Chelan project will be another item.

Cultivating Good Will in Oklahoma.—At another of the "good will" conventions being held by the Oklahoma Utilities Association, Public Relations Division, in various cities of the state—this one in Lawton on Feb. 23—E. R. Ernsberger, president of the association, gave the executive's viewpoint as head of the Southwestern Light & Power Company, and E. F. McKay, secretary of the association, told how that body "ties in." Many utility men took part, and there was a banquet and entertainment in a church dining hall in the evening.

Cooper Gets Rights on Fork of Columbia.—Acting under the authority conferred in an Attorney-General's opinion (Electrical World, Feb. 18, page 370), R. K. Tiffany, State Hydraulics Supervisor, has bestowed Washington water rights for a power development to cost $17,600,000 upon Hugh L. Cooper of New York City. This is the 260,000-hp. "Z" Canyon enterprise, on Clark's Fork of the Columbia River, already described. The power plant, reservoir and impounding dam will all be in the immediate vicinity of Metaline Falls, Wash.

Ohio State University Offers Technical Fellowship. — The Ohio State University announces the Stillman W. Robinson fellowship, having an annual value of $750, for graduate study and research in electrical, mechanical or civil engineering. Further information may be obtained from the dean of the Graduate School, Ohio State University, Columbus, Ohio.

Growth of Shawinigan System.—The annual report of the Shawinigan Water & Power Company refers to an extension of its No. 2 power plant at Shawinigan Falls which will be carried through during 1928 and will add 43,000 hp. to its rated capacity. During the year there were added to the company's systems 82 communities, with an addition of 648 miles of lines, through construction and purchase. Two new customers were the Ste. Anne paper plant at Beaupré and the Anglo-Canadian Pulp & Paper Mills at Quebec City.

## *Coming Meetings*

[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for Jan. 7, page 80.]

American Institute of Electrical Engineers—St. Louis regional meeting, March 7-9; Baltimore regional meeting, April 17-19; New Haven regional meeting, May 9-11. F. L. Hutchinson, 33 West 39th St., New York.

Northwest Electric Light and Power Association — Engineering Section, Spokane, Wash., March 8 and 9; Accounting Section, Portland, Ore., March 12. Berkeley Snow, 1208 Spaulding Building, Portland, Ore.

Oklahoma Utilities Association—Mayo Hotel, Tulsa, March 13-15. E. F. McKay, 1020 Petroleum Bldg., Oklahoma City.

Illinois State Electric Association—Hotel Abraham Lincoln, March 14-15. R. V. Prather, 205 Illinois Mine Workers' Bldg., Springfield, Ill.

National Electrical Manufacturers' Association—Policies Division, Edgewater Beach Hotel, Chicago, March 14-16. S. N. Clarkson, 420 Lexington Ave., New York.

International Association of Electrical Inspectors—Madison, Wis., March 17-18. W. Wilke, 4211 Eiring Place, Milwaukee.

Maryland Utilities Association—Emerson Hotel, Baltimore, March 23. G. S. Williams, 1005 Continental Bldg., Baltimore.

Southwestern Division, N. E. L. A.—Edgewater Gulf Hotel, Biloxi, Miss., April 3-5. S. J. Ballinger, San Antonio Public Service Company, San Antonio, Tex.

Nebraska Section, N. E. L. A.—Omaha, April 4 and 5. T. E. Browne, 1527 Sharpe Bldg., Lincoln.

Southeastern Division, N. E. L. A.—Miami, Fla., April 11-14. C. M. Kilian, 207 Bona Allen Bldg., Atlanta.

American Welding Society—Engineering Societies Building, New York, April 25-27. M. M. Kelly, 29 West 39th St., New York.

American Electrochemical Society—Bridgeport, Conn., April 26-28. C. G. Fink, Columbia University, New York.

Missouri Association of Public Utilities—Jefferson City, April 26-28. F. D. Beardslee, 315 North Twelfth St., St. Louis.

Southwestern Public Service Association—Dallas, Tex., May 2-5. E. N. Willis, 403 Slaughter Bldg., Dallas.

Middle West Division, N. E. L. A.—Hotel Statler, St. Louis, May 9-11. T. A. Browne, 1519 O St., Lincoln, Neb.

Memphis Rates to Be Cut, but How?—Negotiations for a reduction in electric light rates that will save some classes of Memphis consumers $90,000 a year have been under way between city officials and the Memphis Power & Light Company. The light company has a surplus of $200,000 over the percentage of profit allowed to it by the state. Under the law it must cut its rates so that its revenues will be decreased by $90,000 each year for the next three years. The question to be settled is whether the saving shall go to the home users or the commercial consumers.

Pennsylvania Railroad Has Electrification Plans for Baltimore.—The Pennsylvania Railroad's plans for increased facilities in Baltimore, costing from $22,500,000 to $30,000,000, include electrification of all its lines in the main part of the city, at an estimated cost between $7,500,000 and $15,000,000, and construction of two additional tunnels approximately paralleling the present Pennsylvania tubes under the city. The Baltimore electrification program is distinct from the previously announced plan to electrify the Pennsylvania's main line from New York to Washington.

New Power Company for Southern Maryland.—Application for permission to construct an electric power system in southern Maryland to serve communities in St. Mary's, Calvert, Charles and Prince George's Counties where electric service has not existed heretofore has been filed with the Public Service Commission by the Suburban Light & Power Company, an organization of Maryland and Cleveland business men. Either contracts will be made for the purchase of power from Baltimore or Washington utilities or the company will build its own power plant.

Pacific Gas & Electric Company's 1928 Program Involves $22,500,000.—The Pacific Gas & Electric Company's construction and maintenance budget for 1928 for additions and betterments to plants involves expenditures in excess of $22,500,000. One of the major activities is the Mokelumne River development, which was described in the Electrical World for Dec. 31 (page 1367). In Placer and Nevada Counties additions to the Spaulding-Drum developments will be completed, involving the erection of the Spaulding No. 3 plant, a 10,000-hp. unit on Lake Spaulding; the replacing of temporary structures and relining of the Drum Canal, providing increased water capacities, and the installation of a penstock and a fourth generating unit of 20,000 hp. at the Drum plant near Colfax, which will bring this plant up to an installed capacity of 70,000 hp. In the East Bay territory work will continue on the enlargement of the company's steam-electric plant in Oakland, where, as already reported, a new 37,500-kw. turbine is being installed.

**Vermont Electrical Association Meets at Burlington.**—The Vermont Electrical Association held its winter meeting in Burlington on March 1, and members had an opportunity to visit the new hydro-electric plant of the Burlington Light & Power Company at Winooski Gorge. At the banquet H. B. Kinnison, United States Geological Survey, was to talk on "Special Features of the New England Flood of 1927," and M. G. Clark, vice-president of the People's Hydro-Electric Vermont Corporation, was down to give "an executive's viewpoint of problems resulting from the freshet."

**Kentucky Utilities Shuts Down a Generating Station.**—The Kentucky Utilities Company has announced the shutdown of the Dorchester generating station of the Old Dominion Power Company, a subsidiary, near Norton, Va., following the addition of a 33,000-volt circuit to its steel-tower transmission line between the Pocket (Va.) generating station and Imboden and the reconstruction of the old circuit. With the improved transmission facilities it was found that the Pocket station could easily carry the increased power load of the Dorchester station and at a reduced cost. The Dorchester plant will be held as an emergency unit.

**Electrically Welded Railroad Bridge Ready for Use.**—An electrically welded steel-truss bridge has been set in place across a canal at Chicopee Falls, Mass., and as soon as flooring and track have been laid it will be in regular use by the Boston & Maine Railroad in moving freight to and from the river plant of the Westinghouse Electric & Manufacturing Company, where large radio transmitters are being produced for naval and marine use. The bridge is 175 ft. long and its weight is 80 tons. It meets the same requirements as a riveted structure of 120 tons and is considered more satisfactory and durable Studies are being made for eight main-line railroads contemplating the use of such bridges, according to Gilbert D. Fish, consulting engineer with the Westinghouse company

**Iowa's Claim to Leadership in Electrical Saturation.**—Production and sale of electrical energy in Iowa during 1927 surpassed all previous records, and figures from the Geological Survey reports quoted by Joe Carmichael at the Iowa Power Conference put the total excess for last year over 1926 at almost 60,000,000 kw.-hr. Production for 1927 was approximately 1,403,684,400 kw.-hr. Iowa claims to be the most thoroughly electrified state. Electric service is now available to 99.7 per cent of her urban population, the estimate says. She has approximately 11,000 miles of transmission lines, and during 1927 the State Board of Railroad Commissioners granted franchises for the construction of 827 miles, and county boards of supervisors for the construction of 188 miles. Of the 922 cities and towns in Iowa, 884 have electrical energy available. Those not served have populations under 400.

**Record-Breaking Turbines for Conowingo.**—Unprecedented in physical dimensions, according to the manufacturer, the Allis-Chalmers Manufacturing Company, the four 54,000-hp. hydraulic turbines built for the Conowingo development of the Philadelphia Electric Company, two of which are already installed, have many points of interest. They will operate at a speed of 81.8 r.p.m. under a normal head of 89 ft. The turbines are single-runner, vertical-shaft type with steel-plate spiral castings. The cast-steel runners have an over-all diameter of 17 ft. 9 in. and weigh approximately 100 tons each. The butterfly valves have a diameter of 27 ft.

**Philadelphia Suburban-Counties to Expand Barbadoes Island Plant.**—The Philadelphia Suburban-Counties Gas & Electric Company will spend more than $6,000,000 during the current year for plant extensions and improvements, according to an announcement made by H. H. Ganser, vice-president and general manager of the company, which is a subsidiary of the United Gas Improvement Company. Contemplated improvements in the electric department include the expansion of the Barbadoes Island power plant in the Schuylkill at Norristown, additional facilities at various substations throughout the territory and numerous power-line extensions to tie in the system.

**New York City's Three Coming 160,000-Kw. Generators.**—The next twelve or fifteen months will see an increase in the generating machinery serving the New York Edison and United Electric Light & Power companies in the Manhattan and Bronx boroughs of New York City of 50 per cent. This will be brought about by the installation of three 160,000-kw. generators, two at the Hell Gate and one at the East River station. Thus the rating of Hell Gate, now 285,000 kw., will increase to 605,000 kw. and that of East River, now 120,000 kw., to 280,000 kw. The entire system will go up from 925,000 kw. to 1,405,000 kw.

**Coming Hydro Development Near Ogdensburg, N. Y.**—The St. Lawrence Valley Power Corporation will begin extensive developments at the Eel Weir, about five miles from Ogdensburg, N. Y., about April 1, according to an announcement made by F. A. Stoughton, president of the corporation, which purchased the Eel Weir some months ago. A concrete dam 14 ft. high will be built, also a large power house of the three-unit type, the turbines for which have already been ordered. The total capacity will be 3,000 hp. The company has the right-of-way from Eel Weir direct to Ogdensburg. Sept. 1 is set for the completion of the work.

**California-Oregon Suing to Get Fort Klamath Territory.**—The Oregon Public Service Commission is the defendant in a suit by the California-Oregon Power Company to set aside an order of the commission (Electrical World, Dec. 17, page 1270) which gives to the Wood River Power Company the exclusive right to furnish light and power to Fort Klamath on the ground of priority. This suit is the outcome of a long and bitterly contested controversy. The California-Oregon company claims that it was first in the territory by reason of negotiations with prospective customers and the government long prior to the existence of the Wood River Power Company. The suit raises the question of the comparative importance of a blanket franchise granted by a county court and a certificate of convenience and necessity.

**Manhattan (Kan.) Voters Demand Low Rates.**—Refusing by a vote of three to one to renew the franchise of the United Power & Light Corporation, despite an accompanying rate reduction of about 15 per cent, citizens of Manhattan, Kan., through the City Commission, have served notice on the company that franchise negotiations will not be reopened until still lower rates are offered. Unless such rates are offered "within a reasonable length of time," the city will petition the state commission for them. The proposed franchise had been recommended by the City Commission and Mayor, a special franchise committee, the Chamber of Commerce and leading newspapers. The company has also prepared reduced schedules for Salina and is doing so for Junction City.

**Electric-Steam Generator Installed at Lewiston, Me.**—Lewiston, Me., now boasts an electric-steam generator installed by the Central Maine Power Company at its steam plant there to utilize surplus hydro power from Gulf

Island. The boiler is 66 in. in diameter, 19 ft. over all and contains 72 steel tubes 3 in. in diameter by 16 ft. in length. The boiler was constructed for a working pressure of 125 lb. and is rated at 1,200 kw. The electrical equipment, furnished by the General Electric Company, consists of 144 heating units, four control panels and four pressure governors. The boiler is designed for a 440-volt, three-phase circuit. The energy is furnished by two 600-kw., 10,000/460-volt transformers outside the boiler room. It furnishes heat to the plant itself, the company's office building and storeroom, a hotel and a theater.

Stone & Webster Open Office in Paris.—An office for investigation and valuation of utility companies, industries and governmental and municipal projects for American bankers and investors has just been opened at 2 Rue des Italiens, Paris, by Stone & Webster, Inc. James F. Case, who has had engineering and financial experience in Europe, South America, China, the Philippines, Canada and Cuba, will be in charge. He was chairman of the American delegation to the French International Engineering Congress, which studied plans for restoring the French devastated regions. He resigned from Ulen & Company, New York, which has affiliations with Stone & Webster, on Feb. 1.

California Railroad Commission to Investigate Rates of Los Angeles Gas & Electric.—The California Railroad Commission has instituted an investigation into all electric rates charged by the Los Angeles Gas & Electric Corporation in the city of Los Angeles and vicinity. This action is the result of the company's filing a revised schedule of rates applicable to street-lighting service and embodying a reduction from 4 cents a kilowatt-hour to 3 cents. This circumstance, the commission held, invited an investigation into the company's other rates for electric service. Its order brings the rates of virtually all the larger utilities of California before it for investigation or action in some form or another.

Work on New Holtwood Plant to Start in April.—Construction of the thirty-million-dollar hydro-electric plant on the Susquehanna River at Safe Harbor, Pa., 9 miles above the present Holtwood plant and about 25 miles above the Philadelphia Electric Company's Conowingo dam, will be started in April by the Pennsylvania Water & Power Company. Final plans are rapidly nearing completion and bids will be asked soon. It is generally expected that the successful bidder will be the Arundel Corporation of Baltimore, builder of the Conowingo plant. The company has executed with the Consolidated Gas, Electric Light & Power Company of Baltimore a new 43-year agreement covering the use of the Pennsylvania company's power and other facilities in Maryland by the Baltimore central station.

Deepwater Plant to Operate Entirely on 1,200-Lb Steam.—The generating station to be built at Deepwater, N. J., opposite Wilmington, Del., by the American Gas & Electric Company and the American Electric Power Corporation (Stevens & Wood, engineers), which will have an initial generating capacity of 118,500 kw., will have its entire steam demand supplied by high-pressure boilers. There will be two main cross-compound turbine sets, each rated at 54,000 kw. Each set will consist of a 12,500-kw. high-pressure unit operating at 3,600 r.p.m. and a 41,700-kw. low-pressure unit operating at 1,800 r.p.m. The initial steam conditions will be 1,200 lb. gage pressure and 725 deg. F. total temperature. A third high-pressure single-cylinder turbine of 12,500 kw. will be installed and will operate non-condensing. The turbines, generators and exciters will be manufactured and installed by the General Electric Company, which says that Deepwater will be the first central station to operate entirely on a pressure of 1,200-lb. steam.

# Recent Court Decisions

Oral Permission of Husband for Erection of Poles on Wife's Property Accepted at Company's Risk.—Asserting that he had falsely represented himself as his wife's agent and granted oral permission to the Legget Electric Company to erect poles on her land which she afterward forced the company to remove, suit was brought by the latter against the husband for damages based on the alleged deceit (Legget Electric Company vs. Morrison). The North Carolina Supreme Court sustained judgment in favor of the defendant, holding that since the company knew the wife to be the owner, its proceeding to erect the poles without her written authority was at its own risk. (139 S.E. 455.)*

Responsibility of Power Company for Injuries Due to Explosion in Manhole.—The Supreme Judicial Court of Massachusetts found, in Tucker vs. Haverhill Electric Company, that a power company is not liable for injuries resulting from an explosion in a manhole by which the cover was thrown up, the accident apparently being caused by excessive rainfall accumulated in the manhole, unless it had failed to perform some duty which prudence and reasonable care imposed upon it. So finding, the court sustained instructions in the trial court which relieved the Haverhill company from liability because of alleged negligence in failing to prevent the accumulation of water, to inspect the manhole before heavy rain or to provide it with a drain or a secure cover. Where it could not be shown that the explosion would not have happened without the power company's fault the Supreme Court declared, the doctrine of *res ipsa loquitur* ("the thing speaks for itself") did not apply. (159 N.E. 447.)

# Commission Rulings

Colorado Municipal Plant Forbidden to Seek Business Outside Corporate Limits.—The Colorado Public Utilities Commission has denied the municipally owned plant of Loveland permission to sell electricity to customers outside of the corporate limits of that city. The manager of the Loveland plant was said to be encroaching upon the territory served by the Public Service Company of Colorado. It will be recalled that after considerable litigation the city of Loveland about three years ago gained the right to condemn the Public Service Company's plant in Loveland and add it to the municipal electric system of the latter city.

Commission's Jurisdiction Not Terminated by Simultaneous Court Action.—The Clear Creek Power & Development Company complained that in making certain orders connected with alleged invasion of its territory the Colorado Public Utilities Commission was exceeding its jurisdiction. In answer the commission maintained (1) that in a proceeding commenced by filing a complaint against an electric utility alleged to be invading the territory of another company the commission may determine a question raised by an answer asking alternative relief, namely, whether in the event the defendant is not entitled to operate in the vicinity a certificate of public convenience and necessity should be issued to it authorizing such operation; (2) that the commission has jurisdiction to determine the questions raised by a complaint against an alleged invasion of territory by an electric utility and, if the facts should warrant, to grant relief; (3) that a company complaining to the commission against an alleged invasion of territory and also going into a court of equity to secure a temporary injunction to maintain the *status quo* does not by this procedure terminate the jurisdiction of the commission over the complaint.

Uniform Rates Set Up for Rival Municipal and Private Plants.—The municipal plant of Logan City, Utah, and the Utah Power & Light Company are rivals in the light and power business in the city named. In March, 1927, the Utah Public Utilities Commission brought about between them an understanding that both should abandon flat-rate service, install meters and serve their respective consumers on meter rates. The city proceeded to install meters, but again came before the commission to aver that the company had failed to do so and continued to serve its patrons at flat rates, which the city alleged to be unreasonable, discriminatory and in violation of the public utilities act. The company filed objections to the complaint to the effect that its purpose was not to procure reasonable rates to be charged by both plants, but to compel the company to establish rates higher than those established by the city, and that the order applied for would deny the defendant equal protection of the law and its constitutional rights. As an outcome of the above complaint and counter-complaint, the Utah commission has ordered both plants to serve their customers upon a meter basis for a test period of one year at substantially the uniform meter rates charged throughout the state by the Utah Power & Light Company.

# News About Men of the Industry

## *Greenwood Heads N.E.L.A. Commercial Department*

C. Ernest Greenwood of the Edison Electric Illuminating Company of Boston has been appointed director of the newly created commercial department of the National Electric Light Association and will join the headquarters staff March 15. The new department is to function under the direction of the Commercial National Section in an advisory capacity on commercial and merchandising problems confronting electric light and power companies. Mr. Greenwood has always been a resident of Boston. Shortly after his graduation from Harvard he entered the commercial department of the Boston Edison Company and later served in the statistical department on rate analysis problems. He then represented his company in negotiations for service to new buildings and isolated plants and in 1916 was appointed superintendent of the appliance department. Since that time he has specialized in public utility merchandising.

C. E. GREENWOOD

He has for years been active in the work of the National Electric Light Association on the merchandising, refrigeration, range, commercial cooking and promotional rates committees. He was vice-chairman and chairman of the merchandising bureau in 1921 and 1922 and served for two years as chairman of the appliance department of the joint committee for business development. For the last two years Mr. Greenwood has been chairman of the general merchandising committee and inaugurated the Intertrade Conference. He has devoted much of his time to trade relations and co-operative merchandising with dealers. Incident to his other duties he has been editor of *Edison Life*, the employee publication of the Boston Edison.

---

Arthur B. Lisle, formerly general manager of the Narragansett Electric Lighting Company, Providence, R. I., has been elected president of the New England Water, Light & Power Associates, a newly chartered organization controlling the Central Connecticut Light & Power Company and a number of water companies located in various parts of New England. Mr. Lisle recently became president of the Central Connecticut Company, and will continue to make his headquarters at Providence.

Hobart Beresford has been appointed agricultural engineer of the Idaho Power Company, Boise, Idaho.

Gerard Swope, president of the General Electric Company, returned from Europe Feb. 27 aboard the *Leviathan* after a short sojourn abroad.

Philip Gossler, president and chairman of the board of the Columbia Gas & Electric Company, New York, sailed for Cuba last week on the *Munargo*.

John J. O'Brien, president of the Byllesby Engineering & Management Corporation, Chicago, has been elected a member of the board of directors of the Harris Trust & Savings Bank, Chicago.

John W. Storrs, a member of the New Hampshire Public Service Commission, has been named chairman of that body to succeed the late William T. Gunnison. M. M. Morse of Berlin, N. H., has been appointed by Governor Spaulding a member of the commission to fill out the unexpired term of Mr. Gunnison.

Thomas W. Martin, president of the Alabama Power Company, has been elected a member of the board of trustees of the George Peabody College of Nashville, Tenn. Peabody College is an institution for the training of school teachers.

Guglielmo Marconi has been invited by Premier Mussolini to assume the presidency of a committee for the organization of an Italian National Research Council. Such a council has been in existence since 1921, but on account of its peculiar organization it has not been able to obtain satisfactory results. The new council will be a permanent consultative and informative organ of the government concerning the development and progress of scientific activity at home and abroad.

D. Edgar Manson has been elected president of the Gloucester (Mass.) Electric Company, which utility was recently acquired by Charles H. Tenney & Company. Mr. Manson is an executive of several other utilities in the Tenney group. Other officers elected were: Albert B. Tenney, vice-president; Elihu A. Bradley, treasurer; Rockwell C. Tenney, assistant treasurer. W. L. Brown, Jr., who has been with the Gloucester Electric Company for the past twelve years, will continue to act in the capacity of manager.

## *Julian C. Smith New President of Canadian Institute*

Julian C. Smith, vice-president and general manager of the Shawinigan Water & Power Company, Montreal, Que., was installed as president of the Engineering Institute of Canada for 1928 at the Institute's recent annual convention. Mr. Smith has been an outstanding figure in engineering circles in Canada for a number of years, though an American by birth. Elmira, New York, is his native city and Cornell University his alma mater. He began his business career as draftsman with Wallace C. Johnson, consulting engineer, Niagara Falls, N. Y., and when Mr. Johnson removed to Shawinigan Falls, Que., Mr. Smith accompanied him in the capacity of assistant engineer.

J. C. SMITH

It was in 1903 that he threw in his lot with the Shawinigan Water & Power Company, when he became superintendent, advancing to the position of general superintendent three years later. Subsequently he was named general superintendent and chief engineer and in 1913 he was made vice-president. At present, in addition to being vice-president and general manager of the Shawinigan company, he is vice-president of the Dominion Engineering Works, Lachine; president of the Quebec Power Company and of the Montreal Tramways and a director of the Dominion Bridge & Laurentide Power Company and of the Montreal Light, Heat & Power Consolidated. Mr. Smith is a member of the British Institution of Electrical Engineers, the American Institute of Electrical Engineers and the American Society of Civil Engineers.

---

William Lawyer Hinds of Syracuse, N. Y., was elected a director of the New York Telephone Company at the meeting of the board held Feb. 23. Mr. Hinds is vice-president of the Crouse-Hinds Company of Syracuse, manufacturer of electrical supplies, and is also a director of the First Trust & Deposit Company, the Syracuse Savings Bank and the Onondaga Pottery Company of Syracuse. He is also a member of the Syracuse Chamber of Commerce.

**R. C. Hendrickson** has been appointed superintendent of transmission lines of the New York Power & Light Corporation.

**Stanley W. Stoddard** has been appointed assistant electrical engineer of the New England Power System. A native of Massachusetts and a graduate of the University of Maine, Mr. Stoddard has been identified with the New England Power System since 1920, when he entered its employ in the capacity of electrical designer. Formerly he had been identified with Stone & Webster at Boston and with the H. M. Hope Engineering Company. About four years ago Mr. Stoddard was transferred from the drafting room to the electrical engineering office.

**William O. Wood**, widely known in the public utility industry, has just been elected vice-president of Waterbury Cable Service, Inc., New York and Chicago. The Waterbury organization is active in the field of underground cable installation and in street lighting, as well as in furnishing special supplies and accessories necessary to this type of installation. Mr. Wood has for many years past been identified with railroads and electric railways in New York, the South and the Middle West, having been for fifteen years president and general manager of the New York & Queens County Railway Company.

**William Stephen Hart** has been made a vice-president of the Shawinigan Water & Power Company, Montreal, Que. Mr. Hart has been for some years treasurer and director of the Shawinigan company and a director of subsidiary companies. He is a treasurer and a director of the Quebec Power Company and Quebec Railway, Light, Heat & Power Company. Born at Foxborough, Mass., in 1878, Mr. Rart was educated at the Massachusetts Institute of Technology. He took up his residence in Canada in 1903, and in that year joined the Shawinigan Water & Power Company as accountant. He was made secretary in 1906, treasurer in 1912 and director in 1916.

**William L. Abbott**, chief engineer of the Commonwealth Edison Company, Chicago, was the guest of honor at a dinner given at the Palmer House Feb. 14, the occasion commemorating Mr. Abbott's birthday. More than a thousand friends were present and Louis A. Ferguson, toastmaster, read letters and telegrams from many others who were unable to attend. Addresses were made by Samuel Insull, Col. Peter Junkersfeld and Dr. David Kinley. At the close of the speeches Mr. Ferguson presented to Mr. Abbott a silver service as a remembrance of the happy occasion. Mr. Abbott has been affiliated with the Commonwealth Edison Company for 42 years.

## *W. C. Hornberger Vice-President of Arizona Utility*

William C. Hornberger, a public utility man of wide experience, who has been prominently identified with the rapid development of Arizona, became vice-president and general manager of the Arizona Edison Company Feb. 1. The Arizona Edison Company is a subsidiary of the Peoples Light & Power Corporation. Mr. Hornberger's record in the industry shows that he is eminently fitted for his new position. He is a native of Michigan and a graduate of the University of Michigan. Following graduation he was associated for a while with a firm of consulting engineers in Detroit and then went to Phoenix, Ariz., where in 1902 he became connected with the Phoenix Light & Fuel Company, now the Central Arizona Light & Power Company. Beginning work as a switchboard wireman, Mr. Hornberger was steadily promoted to higher positions, in later years becoming successively general superintendent, assistant secretary and assistant general manager of the Central Arizona Light & Power Company. He has held the last-named position for the past eight years. Mr. Hornberger is a director of the Pacific Coast Gas Association, president of the Arizona State Utilities Association and president of the Salt River Valley Electrical League.

W. C. HORNBERGER

---

**W. R. McGeachin**, who has been serving as contract engineer and rate manager for the Iowa-Nebraska Light & Power Company, has been advanced to the position of assistant general manager to Frank H. Brooks, vice-president in charge of operation. Mr. McGeachin is a graduate of the University of Nebraska and for eleven years was in charge of government electrical development in the Philippines, serving as manager of the Manila electrical system. He served in the World War in France as a captain of engineers, and after his return entered the service of the Iowa-Nebraska company. He has served in various capacities in Missouri, Iowa and Nebraska. Other changes in the headquarters staff include the promotion of **Otto R. Mallat**, assistant to the manager of the Lincoln district, to the position of assistant secretary, and the naming of **B. H. Conlee**, formerly manager of the Beatrice district, to the place of general contract representative.

## Obituary

**Edward McDonald**, formerly plant superintendent of the Nebraska Power Company, died Jan. 11 in his 59th year. Mr. McDonald had been affiliated with the company for more than ten years.

**Walter Bauer**, president of the Pyrene Manufacturing Company, Newark, N. J., died Feb. 12 in his 44th year. A native of Fort Wayne, Ind., Mr. Bauer became identified with the Fort Wayne Electric Company and later with the General Electric Company. Following this connection he was appointed general manager of the American Eveready Company. After serving for two years as vice-president and general manager of the American Chicle Company, he was named president of the Pyrene Manufacturing Company in 1918, the position he occupied at the time of his death. Mr. Bauer was president of the Fire Equipment Institute for several years.

**Charles P. Hugo Schoellkopf**, a member of the firm of Schoellkopf, Hutton & Pomeroy, Inc., bankers of Buffalo, and vice-chairman of the board and a member of the executive committee of the Niagara Falls Power Company, died Feb. 14 in the Lenox Hill Hospital, New York, after an illness of eight weeks. For many years Mr. Schoellkopf was vice-president of the Niagara Falls Power Company, but he retired from active business several years ago. He was a former treasurer of the Shafer Decker Company of Buffalo and a director of the Buffalo, Niagara & Eastern Power Corporation and the Marine Trust Company of that city. He had large mining interests in Mexico and was connected with many other business enterprises.

**George Urban, Jr.**, 77 years old, one of the early pioneers in the electrical development of the Niagara Frontier, died at his home, near Buffalo, Feb. 23. He was ill but three weeks. Mr. Urban was born in Buffalo in 1850. Many years ago, attracted by the practical possibilities of electricity, Mr. Urban journeyed to New York to interview a rising young inventor, Thomas A. Edison by name. The result of the interview was that Mr. Urban returned to Buffalo with a small electric generator, one of the first Edison built. This generator, now in the possession of the Buffalo General Electric Company, was the first electrical machine in Buffalo. Mr. Urban was vice-president and director of the Buffalo General Electric Company, president and director of the Niagara Electric Service Corporation and a director of the Buffalo, Niagara & Eastern Power Corporation.

# Financial and Statistical News

### *Stocks Remarkably Firm*
### *Levels Changed Little*
### *Recalls 1926 Break*

THE recent stock market decline presents an interesting parallel to that which swept averages down in all markets two years ago. In the case of the power and light stocks, however, federal investigation notwithstanding, the decline has been much less severe and the recovery more prompt.

It is impossible to state definitely that any one factor, such as the investigation, has had any effect. There are two other powerful factors, the general condition of the market and the Federal Reserve policy of tightening money rates. It is a rather remarkable evidence of the strength of these issues that the combination of factors referred to has had so little effect. In fact, a representative group of fifteen common stocks of companies having more than one-third of the total assets of the industry show a gain this week of more than one point on the average. Montana Power is again over 160, against a recent low of 147. Brooklyn Edison is 227, against a low for the year of 206¾. Detroit Edison is more than ten points above the low this year to date. American Gas & Electric Company is over 129, against a recent low of 117½.

These few examples are more or less representative of the more active stocks. There is another large group of inactive issues, but it is impossible to find any substantial number that are materially below levels of a couple of months ago.

## Middle West Utilities to Issue Common Stock

Directors of the Middle West Utilities Company have voted to offer additional common stock to all stockholders at $110 a share in the ratio of 10 per cent of holdings. Rights to stockholders of record March 2 will expire May 15.

## New England Utility Associates Organized

Formal organization of the New England Water, Light & Power Associates has been completed at Boston, Mass., under the auspices of the banking house of Pearson, Erhard & Company. The associates constitute a holding company which has acquired control of various water supply properties in Rhode Island and Massachusetts and also the Central Connecticut Power & Light Company, East Hampton, Conn. The officers of the trust are Arthur B. Lisle, president, and Clarence I. Worcester, vice-president. It was voted to issue $1,450,000 of 5½ per cent collateral twenty-year lien bonds and $750,000 in 6 per cent preferred stock of $100 par value. Two classes of common stock, "A" and "B," will also be issued, but will not be offered to the public. The properties merged now represent a total of about $4,000,000 from the investment standpoint.

**New York Utility Reduces Capital.**—The Orange & Rockland Electric Company has filed a certificate in the office of the Secretary of State reducing its capital stock from $6,000,000 to $5,000,000 and changing par value of shares from 45,000 shares preferred stock $100 par value, 20,000 shares preferred $25 par value and 10,000 shares common $100 par value to 50,000 shares $100 par value. The company's headquarters are at Monroe

## Pacific Gas Capital Increased $240,000,000

The Pacific Gas & Electric Company stockholders at a special meeting voted an increase in capitalization by $240,000,000, making total new capitalization $400,000,000. Under the plan, $80,000,000 in common stock was increased to $200,000,000 and $80,000,000 in 6 per cent preferred to $140,000,000. Two additional classes of preferred stock consisting of 5½ per cent and 5 per cent in the sums of $40,000,000 and $20,000,000 respectively were created. Such action was prompted by the fact that only $1,000,000 in preferred stock remained for sale. Original capitalization was $160,000,000, consisting of one-half common and one-half 6 per cent preferred.

# Regulation Discussed in Massachusetts Hearings

### Attwill's Arguments in Favor of Bill to Insure Jurisdiction by Contract Between Commission and Companies—Some Utilities Attacked Because of Rate Policies

CHAIRMAN HENRY C. ATTWILL of the Massachusetts Department of Public Utilities severely criticised the rate and dividend policies of a number of power companies in the state when recently addressing the legislative committee on power and light in support of a bill to strengthen the regulative powers of the commission. The proposed regulative contract with the state which the bill forces upon the companies under penalty of increased municipal competition, loss of the right of eminent domain and estoppal of capital expansion and the summarized arguments for and against this measure presented at the hearings have been briefly outlined in the news columns of the Electrical World. In view of the widespread interest manifested in the industry and by publicists in the regulative situation in Massachusetts as it has been affected by the appeals of the Worcester and Cambridge Electric Light companies to the federal courts against recent orders of the board reducing rates from 7 to 5 and from 8 to 5.5 cents per kilowatt-hour respectively, extracts from Mr. Attwill's argument for the bill are printed below. In a later issue the major points of opposition made by the companies will be published. Mr. Attwill's defence of the bill follows:

> This recommendation is made by the department with no hostility to the conduct of gas and electric companies by private capital, subject to state regulation. Some of the regulated and protected monopolies in this state resent the thought that rates should be made reasonable and that the public should share in their prosperity. All the members of the department, I think, believe that the principle of regulated monopoly as heretofore obtaining in Massachusetts cannot prevail and that the public will be forced into public operation of the electric utilities unless some means can be advanced by which the greed of some of the electric companies can be curbed. To our minds it is obvious that these utilities cannot continue to boast of their ability to serve the public better and to furnish service at cheaper rates than the public can do itself unless at least some of them approach the efficiency of public-operated utilities of like character and furnish service at somewhere near the rates which the publicly owned plants have shown in this state. . .
>
> If there are no companies in this state operated by private capital which can approach a rate which the Holyoke municipal plant is now giving, and making also a handsome return upon its investment, then it seems to me that the field of the private utility is gone in this Commonwealth, or I mistake very much the temper and the character of the people of the state.
>
> Our suggestions are in no way directed at those utilities which try to do the honorable thing, and which recognize that they owe some duty to the Commonwealth and to their fellow man, but we have got to a place here in the Commonwealth where if what they say is true, if the situation in which the Commonwealth and the people find themselves, according to their theories and assertions, is true, then regulation in Massachusetts in so far as rates are concerned is no longer effective. . . . Constitutional law is largely determined in the last analysis by public sentiment. A true doctrine of public opinion, a true economic theory will never be stopped by any decision of any court in this land. . . .

The battle to free the slaves was not stopped by any decision of the Supreme Court, notwithstanding the Supreme Court in the Dredd Scott case said that it was unconstitutional to free the slave.

After discussing various instances, Mr. Attwill said:

Now I think here in Massachusetts, where, as I recall it, the torch was first raised for liberty of opinion, where was first raised the torch of assault on human slavery, we ought not to be timid in asserting the right that when we grant to a monopoly the right and the power to carry on what I believe to be a state and government function, when we grant and farm out that right to some corporation, that we have the right to impose conditions upon that corporation as to how it shall conduct that governmental function which we have intrusted to it. . . . We are asserting here the principle that the time has come when we should tie up the power to regulate rates as the part of the charter of each of these corporations, the same as we have done time and time before, the same as we did when we granted the Elevated Railway the right to build its elevated structures in the city of Boston. We then said, "You shall charge so much, and no more." Many are the instances of toll bridges being erected in this Commonwealth and throughout New England where they have said exactly the same thing.

The first section of the bill provides that the gas and electric companies may readjust their stock so that the premiums and any profits that they have not withdrawn, up to 7 per cent on an average since their existence, may also be capitalized; that by that adjustment and by that rearrangement of stock they agree with the Commonwealth that there shall be an amendment to their charter to the effect that they shall thereafter be subject to such rates and charges as the Commonwealth may prescribe, subject, however, to the condition that the Commonwealth shall never again prescribe rates which will prevent them from paying dividends sufficient and adequate to maintain their stock at par.

When we guarantee, in effect, a public utility corporation—as we do in this Commonwealth, in a sense—against loss, because everybody must recognize that in a way the statutes of this Commonwealth at the present time provide that no stock can be issued except at par, we have got to maintain the credit of that company at all times, so that its stock will sell at par, in order that it may be able to get the capital needed to make extensions and improvements which the public service may require.

Now, as a practical matter we give them a monopoly of operation; we in effect guarantee the integrity of their stock, and it would seem that we ought to receive some consideration in exchange for those wonderful privileges that we give them.

Think of it, under Massachusetts rules, the rules we have had here, the war came on and these companies expected that they would be allowed by the department to increase the tax upon the public to preserve the integrity of their investment. Which was done! In largely every instance relating to gas and electric companies you will find that when they asked for an increased rate to preserve the integrity of their investment during the war it was allowed; they levied that burden upon the public, and they received the privilege of doing that very thing. Now, after the war is over and they are prospering and taking exorbitant profits, they decline to divide with the public, and they intrench themselves behind this alleged right to practice extortion and corporate greed upon the public of this Commonwealth.

Now, I am not saying that this applies to all of the companies. It certainly does apply to some of them. And if the Commonwealth of Massachusetts is to receive no relief otherwise, there has got to be some legislation of this sort or the only recourse is to go into public operation and ownership of these utilities.

That is all there is to the bill. We say to the corporations that are unwilling to do that, "Very well; you cannot, then, expect the Commonwealth to protect you from competition. You cannot expect that the cities and towns and the people of the cities and towns before they can go into business

## *Stock Quotations of Electric Light and Power and Manufacturing Companies*

in competition with you must be required to buy out your plant. You cannot have your cake and eat it at the same time. And if you are going to take that attitude with the Commonwealth, the people may well say, While we have granted you the sovereign power of eminent domain, we are not justified in doing that unless you are performing a state service or a governmental function, and if you take the attitude that you are a private corporation that is not performing any state or governmental function, you cannot complain if you are not authorized to exercise the sovereign power of eminent domain.

### Public Protection Needed

We have no pride in phraseology, but we do say that we ought to have some such legislation or the people of Massachusetts will realize that they have no protection against extortionate charges and corporate greed in the operation of the public utilities; that all they can do is to rely upon the kindness, charity and generosity of these gentlemen who run public utilities in the Commonwealth.

In the first place, it seems to me that we here in Massachusetts are not asking for charity, we are not asking for generosity. We ought not to put ourselves under obligation to these gentlemen who want to make 40, 50 and possibly 60 per cent upon their original investment.

Think of it! Here is a company located in this Commonwealth, amply able to approach and meet the rate which is now charged by the municipal plant in Holyoke, taking the attitude that it ought to receive for its stock in the market, if it sells it, nine times its par value, which means, in order to make the stock worth that amount on a basis of 6 per cent, that it has got to charge the public rates which will produce 54 per cent upon the par value of the stock each and every year. When it does that, do you think the public is going to stand for it? Do you think the public is going to sit idly by, and not go into the business itself, rather than have that sort of situation existing, that sort of burden imposed upon the people of the Commonwealth?

## Radio Corporation Shows Record Net Earnings

Gross income from operations of the Radio Corporation for 1927 has reached the high record of $65,082,074 and net income transferred to surplus, is $8,478,320, against $4,661,397 in 1926. Surplus account shows a write-off of $1,000,000 in the patent account, a reserve of $4,500,000 for plant and equipment and a writing down of $799,310 in sundry, machinery, tools and furniture. Dividends were $1,368,150, leaving surplus at the close of 1927 at $7,029,621, against $6,218,761 a year previous.

Income account shows the deduction of reserves amounting to $3,321,330, against $2,735,090 in 1926. Of 1927 reserves, $2,371,330 has been set aside for federal income taxes and amortization of patents, and $950,000 as a general fund reserve and as reserve against foreign investments, etc.

## Engineers Public Service Earnings Up 12.5 Per Cent

The high lights of the financial statement of the Engineers Public Service system are a 10.7 per cent increase in gross earnings and an expansion of only 9.6 per cent in operating costs, making possible a growth of net earnings amounting to 12.5 per cent. The balance for reserves and for Engineers common stock, after deducting dividend requirements for Engineers preferred stock, increased 26.7 per cent over 1926. The average net return shown by the properties for the year was slightly less than 6 per cent of the net book value.

Operating statistics of the company readily explain the gratifying progress noted above as reflected in the earnings statement. The electrical output of the system is up 17.1 per cent to 746,521,859 kw.-hr. The light and power departments serve a population of 1,314,200, and these departments account for 60.4 per cent gross earnings. The operating ratio in the light and power departments is 46.8, which is considerably better than the average for systems of this type.

Interest, amortization, etc., for the entire system were earned well over three times during the past year, as has been the case since the company's inception. The balance after interest, etc., was $7,921,822, or 26.9 per cent of gross. Balance after subsidiary preferred dividends was $6,312,274. Parent company preferred stock required $2,173,276, leaving $4,034,702 applicable to reserves and to common stock dividends. There are 310,468 shares of no-par $7 preferred outstanding in the hands of the public and of the no-par common about 797,240 shares are outstanding and 200,000 reserved for issue under option warrants. The preferred is currently quoted around 10[illegible] and the common around 34.

HOUSTON LIGHTING FINANCES POWER PLANT ENLARGEMENT.—An amendment to the charter of the Houston Lighting & Power Company, Houston, Tex., increasing its capital stock from $7,000,000 to $9,000,000 has been filed in the Secretary of State's office. The proceeds from the additional stock will be used for enlarging the company's power plant at Deepwater.

## Substantial Volume of New Offerings in February

THOUGH new financing by the electric light and power companies of the country shows signs of easing off this year, the substantial sum of $103,255,500—February's total—is evidence that the electrical utilities will continue to play an important part in the securities market. The figure recorded for February compares with $98,850,000 for January and with $166,000,000 for February, 1927. New securities brought out during the two-month period total $202,105,500, as compared with $389,859,000 during the corresponding period of the preceding year. The Pacific Gas & Electric Company contributed $20,000,000 to the total, as did also the National Public Service Corporation, these being the largest individual issue floated during the month.

Attention is called to the prominent part taken by refunding operations. The public utilities are taking advantage of low money rates by retiring their securities bearing high interest rates in favor of lower interest bearing securities. An interesting feature of the month's financing was the issuance by the Public Service Corporation of New Jersey of 4½ per cent convertible debentures to the amount of $43,689,000 to holders of its common and 8 per cent preferred stock. The average rate of return yielded the investor on the February offerings declined to the 5.20 per cent mark from 5.40 in January.

### *Security Issues of Electric Service Companies in February*

| Name of Company | Amount of Issue (Par Value) | Period Years | Class | Purpose | Interest Rate | Price | Per Cent Yield |
|---|---|---|---|---|---|---|---|
| Pennsylvania Water & Power Co. | $6,000,000 | 40 | First refunding mortgage gold bonds, series B | To retire bonds | 4½ | 99 | 4.55 |
| Pacific Gas & Electric Co. | 20,000,000 | 29 | First and refunding mortgage gold bonds, series E | To retire funded debt of subsidiaries recently acquired | 4½ | 99 | 4.56 |
| Indiana Service Corp. | 5,000,000 | 35 | First lien and refunding mortgage gold bonds, series A | To reimburse for capital expenditures and for additions and improvements | 5 | 99½ | 5.03 |
| National Gas & Electric Corp. | 3,400,000 | 25 | First mortgage collateral gold bonds | To provide funds for purchase of securities of subsidiaries or for other capital requirements | 5½ | 98½ | 5.60 |
|  | 1,800,000 | 3 | Convertible gold notes |  | 5½ | 100 | 5.50 |

# Business News and Market Conditions

## Base Wire Price Indicates Small Differential

*Present Price Lower Than That Quoted at Beginning of 1927 — Margin in Carload Lots About 1½ Cents*

DESPITE the complaint of wire manufacturers that prices are very close owing to keen competition, the year 1927 closed with a base copper wire price lower than that quoted at the beginning of the year. The base price is only 1¾ cents higher than the market price of electrolytic copper and is that figure today. The published base prices for the year 1927 are given in the accompanying table. The figures shown are the same as those printed in the ELECTRICAL WORLD each week in connection with the non-ferrous metal market prices and survey.

PUBLISHED BASE WIRE PRICES

| Date<br>1927 | Copper | Differential | Finished Base |
|---|---|---|---|
| Jan. 4 | 13¼ | $2.00 | 15¼ |
| Jan. 13 | 13⅜ | 2.00 | 15⅜ |
| Jan. 28 | 13¼ | 2.00 | 15¼ |
| Feb. 1 | 13 | 2.00 | 15 |
| Feb. 7 | 12¾ | 2.00 | 14¾ |
| Feb. 8 | 12⅝ | 2.125 | 14¾ |
| Feb. 11 | 12⅞ | 2.00 | 14⅞ |
| Feb. 21 | 13⅛ | 2.00 | 15⅛ |
| Feb. 28 | 13⅜ | 2.00 | 15⅜ |
| April 7 | 13 | 2.00 | 15 |
| April 20 | 13⅛ | 2.00 | 15⅛ |
| May 24 | 12¾ | 2.00 | 14¾ |
| June 22 | 12½ | 2.00 | 14½ |
| July 18 | 12¾ | 2.00 | 14¾ |
| July 25 | 13 | 2.00 | 15 |
| Aug. 2 | 13¼ | 2.00 | 15¼ |
| Nov. 9 | 13¾ | 1.75 | 15½ |
| Nov. 19 | 13⅞ | 1.75 | 15⅝ |
| Dec. 1 | 13⅞ | 1.75 | 15⅝ |
| Dec. 2 | 14 | 1.75 | 15¾ |
| Dec. 7 | 14⅛ | 1.75 | 15⅞ |

NOTE.—Base wire prices are listed only when a change in the price of copper takes place.

In carload lots the differential is about ¼ cent less, making a present differential of only about 1½ cents over the actual selling price of electrolytic copper delivered.

In discussing the situation and to emphasize that wire business is being done on an extremely close and unprofitable margin, manufacturers estimate that the gross business of the whole wire industry is between $150,000,000 and $200,000,000 and the capital investment is over $100,000,000. The return on the capital investment is estimated as probably not more than 5 per cent. In addition to the poor return, it is pointed out that the manufacturer carries a very high business risk when one considers the violent fluctuations in the copper market over the last ten years and the possibility of similar fluctuations at any time.

## *Value and Destination of Electrical Exports for December, 1927, Compared With Corresponding Month in 1926*

(Issued by Bureau of Foreign and Domestic Commerce)

| Articles | December | |
|---|---|---|
| | 1926 | 1927 |
| Generators: | | |
| Direct-current: | | |
| Under 500 kw. | $83,270 | $76,946 |
| 500 kw. and over | 12,150 | 86,026 |
| Alternating-current: | | |
| Under 2,000 kva. | 3,313 | 8,646 |
| 2,000 kva. and over | 198,629 | 77,918 |

## Table of Preferred Numbers Issued by A.E.S.C.

The American Engineering Standards Committee has just published and informally approved a table of preferred numbers which is being recommended to American industry for trial and criticism. This system of preferred numbers with the approval of industry may at a later date be considered for adoption as an American standard. The committee, in discussing the system of preferred numbers, states that its purpose is to eliminate the economic loss involved in the haphazard and often needlessly numerous gradations of size that characterize most of our common commodities. The fundamental elements of the system lie in the proposal to arrange standard size series so that each succeeding model in a series shall be larger than the preceding size, not by a definite amount, but by a fixed percentage. By decreasing the number of sizes within a certain range, while retaining a sufficient number of sizes in all parts of the range, a system of preferred numbers makes it possible to effect savings in materials, labor, storage space, gages, containers, catalogs, sales cost, etc. As an example of the working of preferred numbers, it is pointed out that a difference of ¼ in. in width would be important in a brush ½ in. wide, while in a brush 5 in. wide a difference of ¼ in. would be hardly discernible. Instead of having quarter inch increases throughout the whole range of sizes, therefore, sizes can be increased by a fixed percentage without eliminating any which are necessary and decreasing the total number. It is further added that preferred numbers have been used with success in many European countries, including France and Germany, and their adoption in this country is considered by many engineers to be one of the most important steps in the industrial standardization movement.

# Market Conditions

VIRTUALLY throughout the country activities in the industry are reported at a good level, with some interesting orders placed. In the New England district increasing strength is noted. Small motor sales gained and shipments of pole line hardware, cross-arms and wire to northern New England are recorded in good volume. Industrial electric heating also is active. Large substation equipment orders amounting to nearly $500,000 were placed in the New York district and current inquiries point to a heavy volume of buying at an early date. A Long Island company bought $100,000 worth of switching equipment and a central-station company in northern New York ordered generating equipment amounting to $130,000.

Trade is quiet in the Southeast, but a good deal of industrial business is in prospect. An Alabama steel mill purchased $70,000 worth of motors and control equipment. A new city ordinance in Atlanta has stimulated sign business, and three municipalities purchased $12,000 worth of motors and pumps for water works. Industrial equipment sales are active in the St. Louis district. A manufacturer ordered $25,000 worth of motors and an oil company bought $100,000 worth of apparatus. An order for $175,000 worth of substation equipment also was placed in St. Louis. Sales of small industrial equipment are above normal. Utilities continue active buyers in the Middle West and building construction is increasing. On the Pacific Coast an active week has been reported, many pole orders were placed, and oil field buying was very good. Motor sales in Seattle exceeded those of any one week since the first of the year.

### *Low Prices Stimulate Sales in Metal Market*

At the expense of a decline in price the tonnage sold in the non-ferrous metal market was the best for a considerable period. Copper touched 13.875 cents on some sales on Tuesday, and on Monday 5.40 cents was done for zinc. There has been some upward reaction in both metals since then. Lead is now 6 cents in New York and could probably be obtained in St. Louis at 5.75 cents. Tin has been up and down with little or no net change.

NEW YORK METAL MARKET PRICES

| | Feb. 21, 1928 Cents per Pound | Feb. 29, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic...... | 14 | 13.95 |
| Lead, Am. S. & R. price | 6¼ | 6 |
| Antimony............... | 10⅝ | 10½ |
| Nickel, ingot........... | 35 | 35 |
| Zinc spots............... | 5.80 | 5.825 |
| Tin, Straits.............. | 51.725 | 51⅝ |
| Aluminum, 99 per cent... | 24.30 | 24.30 |

Base copper price Feb. 29, 1928, 15¼ cents.

### *Industrial Prospects Bright in the Southeast*

Trade in the Southeast is quiet, with central-station companies not yet buying in the volume to be expected for this period. There is a very satisfactory amount of industrial business in prospect. The largest order reported was placed by an Alabama steel mill for synchronous motors and control equipment amounting to $70,000, the same mill also ordering $25,000 worth of small motor equipment. A central-station company ordered distribution and small power transformers agrgegating $14,000 and creosoted pine poles totaling $4,200. Another central-station order was for house-type meters amounting to $2,200. Small sign installations are showing a healthy increase, particularly in Atlanta, where a city ordinance has been changed to permit of signs projecting over the sidewalks. One order covered $1,400 worth of sign equipment.

Orders from three municipalities for motors and pumps for municipal water works, amounting to $12,000, were reported by a manufacturer. "Whiteway" equipment continues in satisfactory demand and among the orders for this material was one for $4,400 worth of metal standards and parkway cable for a Georgia town and two orders from Louisiana towns for equipment totaling $3,000. Merchandising activities of central-station companies continue brisk, one of the larger companies having recently sold 1,975 waffle irons in an eight-day sales campaign.

Construction projects are as follows: The Strowd-Holcombe Cotton Mills, Inc., Birmingham, Ala., plans an addition to cost $100,000. Henderson, Ky., plans extensions in its light and power plant to cost $50,000. The Henry Vogt Machine Company, Louisville, Ky., plans an addition to cost $100,000. Louise, Miss., plans a transmission line from Yazoo City, and the installation of a light and power system. Marshall, N. C., plans a hydro-electric power plant on the French Broad River to cost $100,000. The American Tobacco Company, Reidsville, N. C., plans an addition to its plant to cost about $750,000. The United States Corrugated Fibre Box Company, Wheeling, W. Va., plans a new plant unit to cost $125,000.

### *Market Gains Strength in New England District*

Increasing strength in the electrical market is noted in the New England district. While no sales of outstanding interest were reported there was an encouraging activity in many lines. Small motor sales gained and one manufacturer reports that New England motor business is in advance in volume to date as compared with other districts, while another company records a steady demand for fractional-horsepower motors with the weekly volume comparable with that of last year. Shipments of pole-line hardware, cross-arms and wire to northern New England are recorded in good volume, and central-station buying is showing more vigor. Industrial electric heating is active. From southeastern Massachusetts and Rhode Island reports from manufacturers show much encouragement. The demand for special heating types is marked. Street lighting negotiations are numerous. A manufacturer of arc-welding equipment reports February orders advancing over those of January. Electric refrigerator sales are promising and one manufacturer plans for a 100 per cent increase in New England during the coming year.

New projects include an expansion of the Firestone Mills, New Bedford; a new mill will soon be erected for a Keene (N. H.) silk company; the American Electric Manufacturing company, Phillipsdale, R. I. plans the purchase of new equipment, and Middletown, Conn., plans a lighting system on Main Street.

## *Large Substation Equipment Buying in Eastern District*

Substation business features equipment sales in the Eastern district and current inquiries point to a heavy volume of commitments at an early date. One company placed orders for nearly $500,000 worth of substation apparatus. Transformer business is trending upward and a leading manufacturer reports that the volume of sales for the first two months of this year exceeds those for the same period a year ago. While orders are relatively smaller, the broader extent of gross sales gives this showing. Out-door switching equipment is growing in demand. A Long Island company placed an order for about $100,000 worth of switching equipment. A utility operating in northern New York has been an active purchaser of switching apparatus, and also has purchased a 12,500-kva. waterwheel generating unit, with transformers and auxiliary apparatus aggregating $130,000. Orders from one company for motor-generator units for traction service amounted to $70,000. Transmission line business is quiet, although the early prospects appear better.

Industrial business continues at a good rate with motors and control apparatus especially active. Business in that line is advancing, with a call from iron and steel mills, textile mills, pulp and paper mills, and baking plants exceeding those of other basic industries. Baking plants have been prominent consumers in recent weeks. The Bethlehem Steel Company recently contracted with a leading manufacturer for control apparatus to cost about $42,000 for extensions in its limestone quarries at Naginey, Pa., to cost $200,000. A paper-manufacturing company at New York soon will place orders for control equipment for a proposed bag and paper mill at Tacoma, Wash., to cost more than $1,500,000. The Donner Steel Company, Buffalo, has placed an order for a 60-ton oil-electric locomotive, and the American Rolling Mill Company, Middletown, Ohio, has contracted for a unit of 100 tons capacity for service at its local mills. Minor demand and equally minor sales prevail in the electric railway equipment field, inquiries are scattered and business does not hold any promise for some weeks to come.

Construction projects comprise the following: The Signal Corps Procurement District, Governors Island, New York, is asking bids until March 13, for voltmeters, ammeters, etc. (Circular 123); for 38,300 ft. of conduit (Circular 125); for 32,100 ft. telephone cable (Circular 126). The Bayonne Steel Ceiling Company plans a plant at Long Island City to cost $100,000. The Bureau of Supplies and Accounts, Washington, D. C., is asking bids until March 6, for five motor-generator sets, with control panels and spare parts for the Brooklyn navy yard (Schedule 8525); also for spare parts for turbo-generators, (Schedule 8585). Spring Lake, N. J., plans municipal power plant. The Kensington Shipyard & Dry Dock Company, Philadelphia, Pa., plans extensions to cost $500,000. The National Lumber & Creosoting Company, Kansas City, Mo., plans a new plant at Wilmington, Del., to cost $1,000,000. The American Analine Products Company, Lock Haven, Pa., plans a new addition to cost $200,000. The United States Engineer, Pittsburgh, Pa., will soon take bids for a power house at Lock 6, Allegheny River, near Clinton, Pa. The Suburban Light & Power Company, Baltimore, Md., plans transmission lines and a distributing system in Calvert, Charles, St. Mary's and Prince George Counties to cost $750,000. The general purchasing officer, Panama Canal, Washington, D. C., will receive bids until March 10, for motors, transformers, switches and other electrical equipment (Schedule 1860). The chief of engineers, United States Army, Washington, D. C., is asking bids until March 27, for one 200-kw. Diesel engine-generating unit, switchboard and auxiliaries (Circular 15).

## *Utilities Continue Active Buyers in Middle West*

Business in the Middle West is good. Here and there a slight slowing down is noticeable. Building activity is increasing, the railroads are contemplating large expenditures for equipment, and the steel industry is in good shape. The various utility companies are planning a good deal of construction work, and the Illinois Bell Telephone Company anticipates an expenditure for the year of $38,000,000. Considerable puchasing of apparatus is going on among which was an order for a number of oil circuit breakers, another for a total of nearly 27,000 kva. of transformers, and three 20-ton electric traveling cranes with appurtenances. Three construction orders, one for coal storage trackage construction valued at $95,000, duct and furnace insulation at $35,000 and pipe covering and insulation materials valued at $30,000 also were placed. Jobbers' sales are normal. Industrial activity is a trifle spotty but municipal and railroad business is good. Appliances are moving in fair volume.

Construction plans are as follows: The American Zinc, Lead & Smelting Company, East St. Louis, Ill., will make plant additions to cost $500,000. The University of Michigan, Ann Arbor, plans a power plant addition to cost $100,000. Detroit, Mich., plans an addition to its Springwells waterworks station to cost $4,000,000. The Michigan Public Service Company plans extensions at Ludington, Mich., to cost $75,000. Moose Lake, Minn., plans a municipal power plant. The Cudahy Packing Company, Newport, Minn., plans a five-story and basement cold storage and refrigerating plant, to cost $115,000. The Glancy Malleable Iron Corporation, Waukesha, Wis., plans an addition to its plant to cost $200,000 Mundelein, Ill., Carrington, N. D., and Neenah, and Kendall, Wis., plan an installation of street lighting equipment.

## *Active Week Reported on the Pacific Coast*

An outstanding construction item reported on the Pacific Coast covers a 16-mile feeder line near Lisbon for the San Francisco-Sacramento electric line estimated to cost $700,000. Work on this line will begin in April. Many pole orders were placed. Oil field orders also were prominent. A steel company bought a switchboard for $2,500. A San Francisco power company bought a switchboard for $15,000. A lime company is in the market for $2,000 worth of wiring material and five assorted motors, a lumber company in the Sierra pine belt bought $3,000 worth of motors, and another lumber company needs $2,000 worth of wiring supplies. A San Francisco jobber bought a carload of electric ranges valued at $10,000. Snow conditions, while low, probably will not affect power supply but may help pumping plant sales.

The city of Seattle passed a bill appropriating $625,000 and authorizing extensions at the Gorge Creek hydroelectric plant on the Skagit River. Weatherproof copper wire amounting to $15,000 and 100 cedar poles also were purchased by the city. A contract for street lighting in Olympia was let for $17,000 and Oregon City, Ore., and Wenatchee, Wash., are planning additional street lighting installations. The Grays Harbor Railway & Light Company, Hoquiam, plans an expenditure of $60,000 for light and power transmission lines, and the Washington Water Power Company plans installing a second unit of 32,200 hp. at Chelan during this summer. Seattle jobbers report motor sales exceeded those of any one week since the first of the year.

Construction projects are as follows: The Arizona Wax Paper Company, Benson, Ariz., plans a plant at Salinas, Calif., to cost $100,000. A. M. Gilstrap, 3002 Logan Street, Oakland, Calif., plans a fruit-canning plant at Yuba City, to cost $450,000. The Pacific Gas & Electric Company, San Francisco, plans a hydro-electric development on the Mokolumne River, near Jackson; and a 50,000-hp. steam plant at Oakland. The Portland Electric Power Company plans a storage plant at Salem, Ore., to cost $50,000. The Airway Division, Department of Commerce, Salt Lake City, Utah, will receive bids until April 14, for 51-ft. steel towers, beacon lights, underground cable, etc., for the Beacon airport. The Western Cold Storage Company, Wenatchee, Wash., plans an ice plant to cost $500,000. The Union Pacific Railroad Company plans a rock-crushing plant near Grand Canyon, Wyo., to cost $200,000. The San Joaquin Light & Power Corporation, Fresno, Calif., plans three 110,000-volt steel tower transmission lines, to connect with Rio Bravo, Corcoran and Taft substations, to cost $550,000.

The Great Northern Utilities Company plans a transmission line between Coutts and Sidney, Mont. The Utah Power & Light Company plans a transmission line from Echo to Evanston, Wyo., to cost $80,000. Stockton, Willows, Madera, Alameda and Berkeley, Calif., and Great Falls, Mont., plan ornamental lighting systems.

### *Industrial Equipment Sales Active in St. Louis*

Conditions in the St. Louis district are holding to a normal level with signs of early spring business in good volume. A large manufacturing company changing from 25 to 60-cycle operation placed an order for motors aggregating $25,000. An oil company operating in the southwestern part of the district closed a contract for 44 400-hp. induction motors and 14 four-panel switchboards for driving pipe line pumps at a total cost of over $100,000. A large local power company closed contracts for transformers, circuit breakers, control and regulating apparatus for a large substation at a total cost of $175,000. Sales of small industrial equipment throughout the district are above normal.

Construction projects are as follows: The Arkansas Power & Light Company will build a transmission line from Gurdon to Delight, Ark., to cost $75,000. The Eastern Arkansas Compress Company, Forrest City, Ark., plans a new plant to cost $100,000. Trenton, Mo., plans a municipal power plant to cost $50,000. The Oklahoma Gas & Electric Company plans substations at Lexington, Meeker, Healdton and Wynnewood to cost $100,000. The Southern Ice & Utilities Company plans an ice plant at Big Spring, Tex., to cost $100,000. The Southwest Textile Mills, Inc., Dallas, Tex., plans a cotton mill to cost $750,000. The Hidalgo Utilities Company, Hidalgo, Tex., plans an ice plant to cost $50,000. The Texas Utilities Company plans a 60-ton ice plant at Mineral Wells, Tex. Muskogee, Okla., plans an ornamental lighting system to cost $50,000.

# Activities of the Trade

## Stone & Webster Open Office in Paris

Stone & Webster, Inc., Boston, announces the opening of a Paris (France) office at 2 Rue des Italiens, in charge of James F. Case, whose engineering and financial career has covered many parts of the Orient and North and South America. In announcing this new office Stone & Webster point out that this step reflects the rapid growth in American financing and enterprises abroad and the increased activity indicated by this country's loans to foreign governments. Among the recent foreign projects upon which the Stone & Wester organization has reported are the Adriatic Electric Company, Lombard Electric Company and the Italian Public Utility Credit Institute.

## American Electric Motor Part of Splitdorf-Bethlehem

The American Electric Motor Company, Cedarburg, Wis., has become a subsidiary of the Splitdorf-Bethlehem Electrical Company, Newark, N. J. In addition to the American Electric Motor Company the Splitdorf company controls the Splitdorf Radio Corporation, the Splitdorf Company of Canada, the Splitdorf Electrical Company, the Splitdorf Manufacturing Company and the Perfection Appliance Company. The American Electric Motor Company, in its new plant at Cedarburg, will continue to manufacture a self-ventilated polyphase induction motor from $\frac{1}{2}$ hp. to 125 hp. supplied with standard sleeve bearings or ball bearings. W. R. Davis has been appointed general manager of the American company and W. M. Sprinkman will have charge of industrial sales.

## General Electric Company Rewards Employees

Twenty-six awards were made to General Electric employees by the Charles A. Coffin Foundation for achievements during the year 1927. Announcement of the names of the winners and the formal presentation of the honorarium of $300, the certificate of award and the lapel button were made recently. The awards were divided as follows: Workmen, seven; tool designers and expert mechanics, three; foremen, five; construction foremen, one; engineers, six, and commercial employees four.

**The Union Metal Manufacturing Company**, Canton, Ohio, through its representative the Southwest General Electric Supply Company, has received an order from Houston, Tex., for 96 twin-light pressed-steel lamp standards, which will be installed on Main Street. Houston will be host to the National Democratic convention this year. The standards will be installed prior to the opening of the convention in June. The company has also received an order from Houston for 21 traffic standards. These standards are of the same general appearance and design as the lighting standards and will carry a side bracket type signal.

**The Wolcott Manufacturing Company**, 80 Pliny Street, Hartford, Conn., and the Beardsley Manufacturing Company, Waterbury, Conn., will be consolidated as the Beardsley & Wolcott Manufacturing Company. Both companies manufacture a line of household appliances. The new officers are: C. E. Beardsley, president-treasurer; Frank E. Wolcott, vice-president; Rowley W. Phillips, secretary; Elton S. Wayland, Henry W. Adams, Jr., George T. Wigmore, Irvin W. Day and William S. Fulton, directors and officers.

**The Stylograph Company**, Rochester, N. Y., announces that its wax sensitized charts used on different types of recording instruments are now available for general purchase. The manufacturer claims that the use of Stylograph charts instead of pen and ink charts permits the installation of permanent points on the graphic instrument and no attention is required throughout the life of the instrument.

**The Allis-Chalmers Manufacturing Company**, Milwaukee, has appointed R. T. Stafford, for years manager in Seattle, Wash., of the Northwest branch of the company, as assistant manager of the electrical department of the Pittsburgh Transformer division of the company at Pittsburgh, Pa. Mr. Stafford will be succeeded as Northwest branch manager by John Alberts, who has been identified with the Allis-Chalmers company for the past sixteen years.

**The General Electric Company**, merchandise department, announces a reduction in the price of its vacuum cleaner. This cleaner, which formerly sold, complete with attachments, for $49, will now be sold without attachments for $35, the present attachments being sold separately for $10. A special set of attachments also will be sold for $6.50.

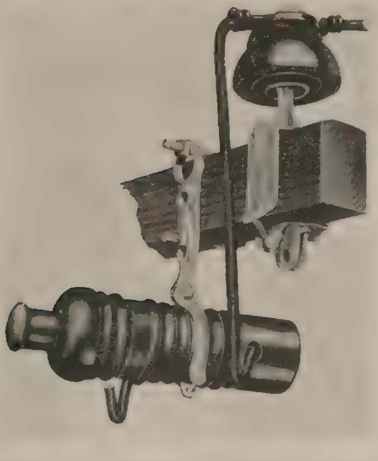
**The Tafel Electric Company**, Louisville, Ky., announces that a fire which gutted the building next to its Louisville house on Feb. 13 only caused damage by water to a portion of its stock of about $40,000 worth of merchandise in its basement. The company states that the majority of its stock on the other four floors of the building was not damaged and owing to prompt shipments of manufacturers and co-operation of local competitors only a half dozen shipments were delayed over 24 hours.

**The Louis Allis Company**, Milwaukee, manufacturer of direct and alternating-current motors, announces the opening of a district sales office in Cleveland. W. F. Glaser has been appointed district sales manager with headquarters at Room 409, Union Building, 1836 Euclid Avenue.

# New Equipment Available

## Fuse and Disconnect Cutout

The Kearney double-duty fuse and disconnect cutout in fuse capacities from 1 amp. to 200 amp. and made of plastic wet process porcelain has been developed by the James R. Kearney Corporation, 4224 Clayton Avenue, St. Louis. The cartridge contacts make direct contact with the machined surfaces of the copper castings to which the line wires are fastened. The contacts are made of spring phosphor bronze. Each line terminal is equipped with two extra heavy screws to eliminate the possibility of the line wire working loose in the terminal block. By interchanging the cartridge with a disconnect blade the unit can be used as a disconnect with a range of capacities from 75 amp. to 300 amp.



METHOD OF MOUNTING KEARNEY DOUBLE-DUTY FUSE AND DISCONNECT CUTOUT

## Spring Clutch

The L. G. S. spring clutch, having only three working parts, the driving member, the driven member and the connecting link, has been placed on the market by the L. G. S. Manufacturing Company, Indianapolis, Ind. Operating within the recesses of the driving and driven members the smooth-surfaced spring-connecting link expands and contracts under friction according to the direction in which the mechanism is turning. Thus a right-hand turn makes a positive connection and the driven member revolves, while a left-hand turn releases the pressure and the driving member runs free.

The clutch is made in three general types. In the ratchet type the clutch may be freely rotated in one direction, but automatically engages when rotated in the opposite direction. With the manual type the clutch is thrown in and out by the operator. In the centrifugal type the clutch is automatically thrown in and out at certain speeds as may be required by the machine to which it is attached. Some of the applications referred to by the manufacturer are as an unloading clutch for electric motors, pumps, air compressors, refrigerating machines, etc.; as a clutch for machine countershafts, washing machines, change feed devices, etc.; as an overrunning clutch for separators, feeding devices, punch presses, etc.; as a reverse mechanism for washing machines, tapping machines, etc., and as a ratchet wrench or for other ratchet tools.

## Line-Start Induction Motors

A line of squirrel-cage induction motors suitable for starting on full-line voltage is being placed on the market by the Allis-Chalmers Manufacturing Company, Milwaukee. These motors are normal-torque, high-reactance machines and will not draw starting currents in excess of limits recommended by the electrical apparatus committee of the National Electric Light Association. They are built in ratings from 7½ hp. to 30 hp., 600 to 3,600 r.p.m., low voltage, and are available with either sleeve or roller bearings. The company states that all the features of Allis-Chalmers construction employed in squirrel-cage motors are maintained in this new line.

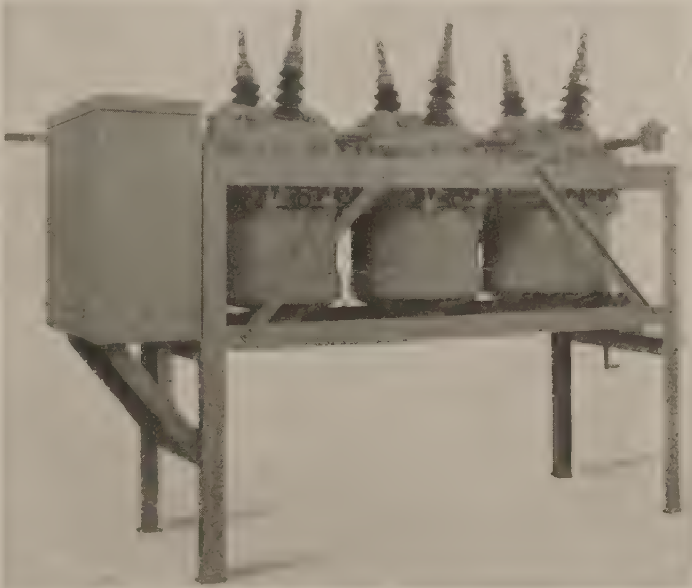
## Subway Sectionalizing Unit

A new type of subway sectionalizing unit for branching underground distribution lines has been placed on the market by the Metropolitan Device Corporation, 1250 Atlantic Avenue, Brooklyn. By its use it is possible to branch main feeders, connect transformers to a low-tension network, connect sub-feeder taps, tie lines and service and to sectionalize safely any section for any reason. The manufacturer states that these units provide a safe, convenient and economical method of branching underground distribution lines and that many combinations and groupings are possible. The units are available in two types, one rated at 250 volts, 500 amp., and the other at 250 volts, 1,500 amp.

## 25-Kv. Circuit Breaker

A high-tension outdoor-type oil circuit breaker for 25-kv. service, known as the type FO-40-25, has been placed on the market by the Condit Electrical Manufacturing Corporation, Boston. The design is based on that of the company's type FO-40 for 37-kv. service and above. The new breakers are furnished for 2,000 amp. or less at 25 kv. and the maximum estimated interrupting capacity is 1,500,000 kva. These breakers may be manually or electrically operated by either alternating or direct-current control, and automatic reclosing service of one or more closing cycles with constant or varying time delay may be added.

The units are mounted on a channel and angle-iron framework, and large porcelain type solid bushings of high mechanical strength extending below the oil line and securely clamped to the pole top with watertight gaskets provide insulation in excess of the A. I. E. E. voltage test requirements. The tanks are cylindrical with rounded bottoms and are built of welded steel plate. The pole top castings are of massive design and are heavily ribbed with a deep extending flange surrounding the tanks to facilitate withstanding gas pressures or secondary explosions incident to rupturing high-powered circuits. Condit laminated brushes are furnished, protected on closing and opening by arcing contacts arranged to provide four breaks in series.



OUTDOOR-TYPE OIL CIRCUIT BREAKERS FOR 25-KV. SERVICE

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued Feb. 14, 1928)

1,658,832. Safety Electric Coupler; L. A. Brown, Uniontown, Pa. App. filed Jan. 5, 1926. For connecting shot firing cables used in mines to a magneto or other source of current.

1,658,848. Theft Alarm; S. M. Kalikow, Brooklyn, N. Y. App. filed Feb. 8, 1926.

1,658,861, 1,658,862. Electrical Outlet Device; H. E. Slade, Glen Ridge, N. J. Apps. filed Dec. 11, 1926.

1,658,872. Electrolytic Apparatus; H. J. Yeager, Lancaster, Pa. App. filed Jan. 16, 1925. For use in the electrolytic deposition of metals.

1,658,884. Electric Knife; M. Cysick, Cotton, Minn. App. filed Feb. 7, 1927. Which can be used most efficiently for cutting warm or hot bread, which if cut by a cold knife will be made heavy.

1,658,887. Duct Grapple; J. F. Dotzauer, Newark, N. J. App. filed Jan. 22, 1926. Used in connection with the placing of cables in underground ducts or conduits.

1,658,900. Time-Controlled Switch; S. Jimenez, San Antonio, Texas. App. filed Sept. 10, 1925.

1,658,902. Electrical Measuring Instrument; R. T. Pierce, East Pittsburgh, Pa. App. filed March 24, 1924. Of the indicating or deflecting type.

1,658,905. Fuse Mechanism; M. J. Sandin, Wilkinson, Pa. App. filed Jan. 23, 1923. Inclosed expulsion-fuse mechanism for outdoor installations.

1,658,906. Phase Balancing System; J. Slepian, Swissvale, Pa. App. filed June 10, 1922. Employing single-phase synchronous condensers for effecting a phase balance.

1,658,912. Electric Circuit Breaker; F. W. Alder, Oakland, and S. N. Baruch, Palo Alto, Cal. App. filed Feb. 24, 1920. Automatic circuit breaker in which all of the separable contacts are submerged in oil.

1,658,913. Switch Mechanism; H. K. Ansingh, Toronto, Can. App. filed Feb. 20, 1923. Circuit breakers of the safety type wherein the circuit breakers and disconnecting switches are inclosed within a metal housing.

1,658,914. Salt for Electrolytic Rectifiers; F. W. Barhoff, Hartford, and W. C. Brooks, Meriden, Conn. App. filed May 26, 1927. A dry salt, needing only the addition of water to form a complete electrolyte for current rectifiers and electrolytic condensers having tantalum or similar filming metal electrodes, which salt is chiefly composed of ammonium bisulphate.

1,658,918. Motor Control System; R. Brooks, Ashton-on-Mersey, and E. H. Croft, Leeds, England. App. filed Jan. 8, 1923. In which the acceleration of a motor by short-circuiting a series resistor is automatically effected by means of electrically actuated switches or contactors.

1,658,926. Selective Overload Trip Relay; F. B. Kniskern, Wilkinsburg, Pa. App. filed Sept. 23, 1924.

1,658,945. Bus-Line Connecter; S. B. Schenck, Wilkinsburg, Pa. App. filed June 5, 1922. A device for connecting up the power line between cars in an electrical railway train.

1,658,948. Phase Balancing System; J. Slepian, Swissvale, Pa. App. field June 10, 1922. Employing single-phase synchronous condensers for effecting a phase balance. A system wherein the respective single-phase components of the delta voltages across three line conductors of a polyphase system are independently regulated in such a manner as to provide an equality or any other predetermined relationship between the magnitudes of the various single-phase delta voltages.

1,658,953. Signaling Apparatus; L. S. Theremin, Leningrad, Russia. App. filed Dec. 5, 1925. For generating sound or producing visual signals for alarm purposes.

1,658,972. Regulator System; O. C. Cordes, Wilkinsburg, Pa. App. filed March 2, 1926. Speed-regulating systems for electric motors. Means for maintaining the speed of an electric motor constant that is easily adjustable to maintain different predetermined speeds and is sensitive in its operation over a wide speed range.

1,658,980. Phase Balancing System; C. Le.G. Fortescue, Pittsburgh, Pa. App. field June 23, 1925. Systems of this character as employ single-phase synchronous condensers for effecting a phase balance. A system wherein two single-phase reactance devices may be utilized to balance the voltage and current in a three-phase or four-phase system or, in general, in any polyphase system.

1,658,983. Signal Wire Hanger; A. J. Gurney, Canton, Ohio. App. filed Nov. 7, 1923.

1,658,990. Electric Heating Unit; A. D. Keene, Pittsburgh, Pa. App. filed March 26, 1925. Embedded electric heating unit.

1,659,013. Spot Lamp; E. G. K. Anderson, Evanston, Ill. App. filed Oct. 25, 1924.

1,659,027, 1,659,028. Clock; F. C. Holtz, Springfield, Ill. Apps. filed Nov. 15, 1924. With a low power electric motor drive.

1,659,050. Storage Battery Charging Apparatus; R. J. Sasseman, Chicago, Ill. App. filed Jan. 30, 1925. For charging the storage batteries of radio receiving apparatus, or for similar purposes.

1,659,058. Thermostatic Switch; R. R. Stitt and C. F. Warrick, Detroit, Mich. App. filed May 1, 1924.

1,659,059. Adjustable Resistance Unit; C. E. Stryker, North Chicago, Ill. App. filed Oct. 21, 1925. As used in railway battery and signal circuits.

1,659,062. Coil Mounting; R. Varley, Englewood, N. J. App. field Nov. 15, 1926. Adapter for the mounting of small coils such as are used in the smaller type of transformers.

1,659,071. Sign Flasher; E. W. Applebaum, Chicago, Ill. App. filed May 27, 1926. For alternating current service.

1,659,091. Portable Oven; R. P. Fabbrini, Chicago, Ill. App. filed May 12, 1926.

1,659,094. Conduit Attaching to Outlet Boxes; F. A. Godfrey, Chicago, Ill. App. filed Oct. 21, 1925.

1,659,102. Electric Water Heater; G. Harvis, Detroit, Mich. App. filed Sept. 24, 1925. Portable type.

1,659,106. Dynamo Electric Machine; F. Hillebrand, Niederschonhausen, Berlin, Germany. App. filed Aug. 22, 1927. Of the split-pole commutator type and has for its object the provision of a self-excited generator of this character in which the voltage may be adjusted over a range from substantially zero to the full voltage of the machine, and in which the terminal voltage for any given adjustment will remain substantially constant.

1,659,110. Continuous Current Transformer; T. C. Lennox, Pittsfield, Mass. App. filed Aug. 20, 1925.

1,659,134. Automatic Electric Water Heater; M. C. Crawley, Groton, N. Y. App. filed Feb. 26, 1924.

1,659,160. Light Extension; A. Richards, Mexico, Me. App. filed June 4, 1924.

1,659,183. Insulator; A. O. Austin, Barberton, Ohio. App. filed Oct. 20, 1921. For high tension use.

1,659,208. Self Winding Clock and the Like; S. Manheim, Bridgeport, Conn. App. filed Dec. 19, 1925.

1,659,256. Clock; M. A. Gerson, Jersey City, N. J. App. filed July 20, 1926. Self-winding electrical clock.

1,659,267. Panel Cabinet for Electrical Connections; J. W. Hooley, Larchmont, N. Y. App. filed Sept. 20, 1926.

1,659,278. Combination Radiant Heater and Curling Iron Attachment; H. E. Meltzer and M. J. Svoren, Racine, Wis. App. filed Aug. 9, 1926.

# New Trade Literature

WIRES AND CABLES. — The General Electric Company, Schenectady, N. Y., is distributing bulletin GEA-905 covering its insulated wires and cables, including data on current-carrying capacities of its paper-insulated, lead-covered cables.

LIGHTNING ARRESTERS.—"Discharge Rate of Lightning Arresters vs. Protection Afforded" is the title of booklet No. 247, the third of a series covering lightning protection and which is being issued by the Electric Service Supplies Company, Seventeenth and Cambria Streets, Philadelphia.

POLYPHASE INDUCTION MOTORS.—Bulletin No. 1118-E issued by the Allis-Chalmers Manufacturing Company, Milwaukee, describes and illustrates its type "AR" squirrel-cage and type "ARY" slip ring poyphase induction motors, with either sleeve or tapered roller bearings.

MOTORS AND GENERATORS. — Bulletins No. 6023, No. 6022 and No. 6025 issued by Engberg's Electric & Mechanical Works, St. Joseph, Mich., describe and illustrate the Engberg constant and adjustable speed, ball bearing, direct-current motors; the type M ball bearing bracket type direct-current generators and motor-generators. Dimension tables are also included in the bulletins.

BEARINGS AND PILLOW BLOCKS.—The Rollway Bearing Company, Inc., Syracuse, N. Y., has issued catalog No. 4-A covering its wide series and utility types of bearings. The company is also distributing bulletins Nos. 53, 54, 55 and 56 covering respectively the self-aligning pillow blocks equipped with Rollway adapter type bearings to fit standard commercial shafting, various precision types of Rollway radial bearings, self-aligning pillow blocks equipped with standard bearings and large Rollway bearings in the recently adopted international sizes.

PLIERS.—A pamphlet issued by the Utility Equipment Company, 1035 East 76th Street, Chicago, covers its high-voltage pliers.

OIL CIRCUIT BREAKERS. — Bulletin GEA-925 issued by the General Electric Company, Schenectady, N. Y., describes and illustrates its types FK, FKO, FHK and FHKO-139 station oil circuit breakers for 7,500 to 220,000 volts and 600- to 2,000-amp. service. Bulletin GEA-926 gives the dimensions of these station oil circuit breakers.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

An agency is desired in Rome, Italy (No. 29,754), for electrical bakery ovens, etc.

An agency is desired in Alexandria, Egypt (No. 29,858), for electric bulbs, fuse boxes, switches and insulated and bare copper wire.

An agency is desired in Berlin, Germany (No. 29,774), for electric dental and medical apparatus.

An agency is desired in Arnhem, Netherlands (No. 29,761), for household electrical appliances.

An agency is desired in Cochabamba, Bolivia (No. 29,840), for household electrical appliances and wiring supplies.

An agency is desired in London, England (No. 29,861), for household labor-saving devices.

Purchase and agency are desired in São Paulo, Brazil (No. 29,871), for farm-lighting sets.

Purchase is desired in Plzen, Czechoslovakia (No. 29,854), of electric planes.

Purchase and agency are desired in Osaka, Japan (No. 29,756), for electric railway equipment.

An agency is desired in Vienna, Austria (No. 29,860), for electric household refrigerators.

Purchase and agency are desired in Magdeburg, Germany (No. 29,856), for electric washing machines.

Purchase is desired in Erfurt, Germany (No. 29,857), of electric washing machines.

Purchase is desired in Magdeburg, Germany (No. 29,855), of electric washing and wringing machines.

The General Engineering Company, 13 Union Bank Building, Apollo Street, Fort Bombay, India, desires to purchase transformers and auxiliary equipment, house service meters and line materials. This company wishes a list of prices and other information in duplicate. A copy of the specifications for this material is available for loan to interested American firms and may be obtained from the Electrical Equipment Division, Bureau of Foreign and Domestic Commerce, Washington, D. C., reference EE 1064.

Carrick Wedderspoon & Company, New Zealand, wishes to get in touch with American manufacturers of electrical equipment with a view to securing agencies. The company is interested in electric ranges, 230 volts; vacuum cleaners; time clocks, 40 days winding, used mostly for hot water heaters, single pole, single throw; electric refrigerators, 230 volts, 50 cycles; electric washing machines, electric sewing motors, domestic heating and cooking devices, electric ironing and washing machines, as well as battery-charging plants for garages. Further information may be obtained upon request to the Electrical Equipment Division, Bureau of Foreign and Domestic Commerce, Washington, D. C., reference EE 1065.

# Business Facts for Electrical Men

Selected Statistics Presented Graphically for
the Use of All Interested in Analyzing the
Trend of the Electrical Business

## Two Homes Out of Three Electrified

With the rapid increase of the number of residential connections to electric power circuits the question has arisen in the electric light and power industry as to the effect of increasing saturation in this respect. It is probably equally pertinent in other lines, notably in the telephone and automobile industries, for by a coincidence the number of telephones, of automobiles and of electric light and power customers are roughly equal, all being in the general neighborhood of 20,000,000, although the distribution between private or residential users on the one hand and commercial or industrial users on the other probably differs.

The total number of electric light and power customers in the United States as of Jan. 1, 1928, was 21,694,100, of whom 17,596,400 were residential, according to figures published in the Electrical World of Jan. 7, 1928.

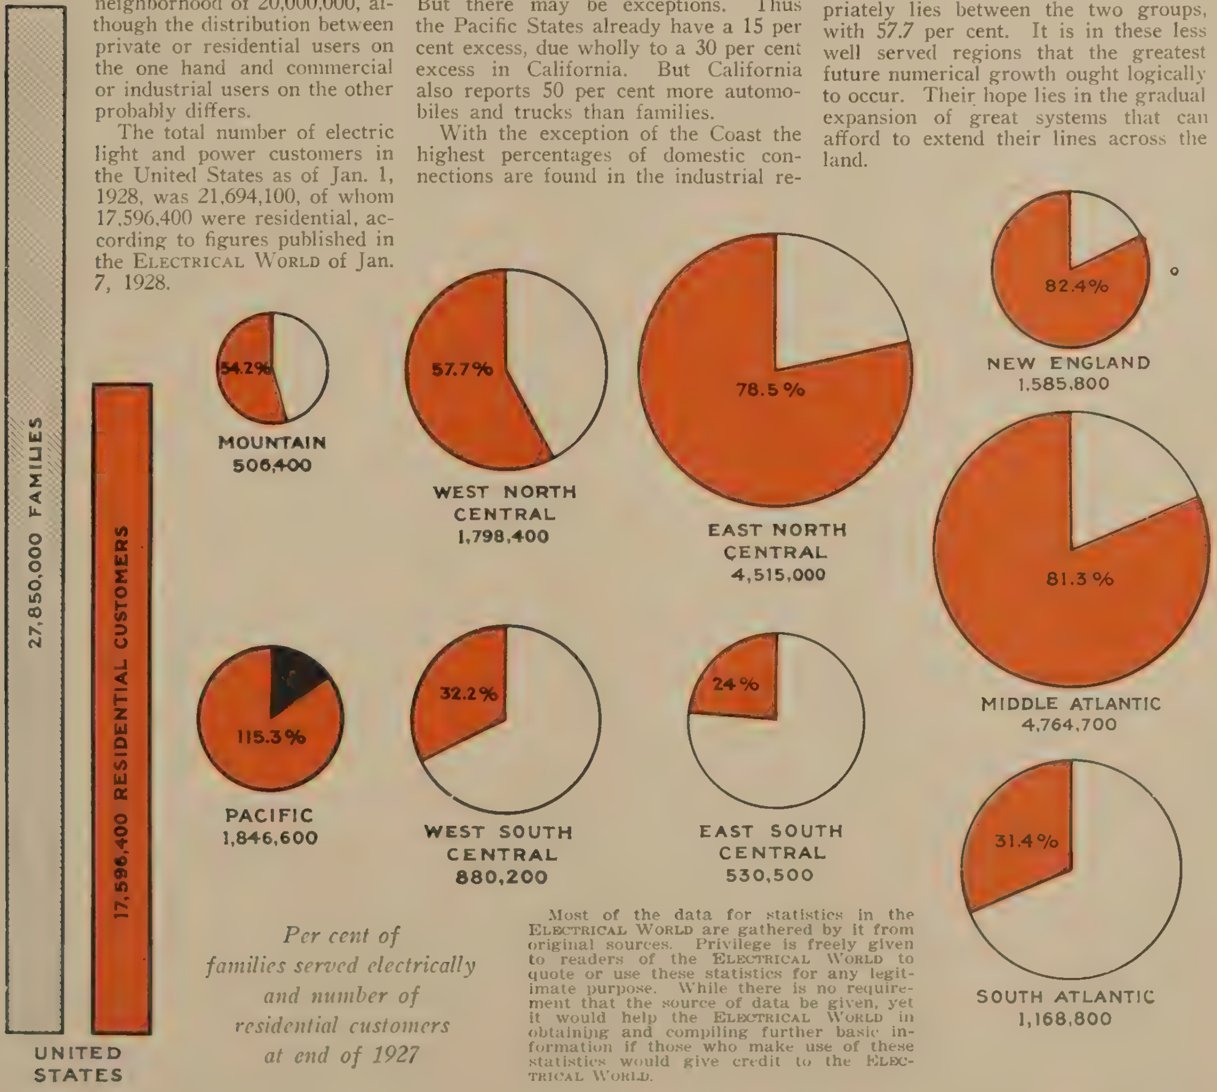
The number of families may be taken approximately at 27,850,000. The number of residential electric customers is thus about 63 per cent of the number of families. It has multiplied tenfold in twenty years.

What of the future? The assumption has been made that the number of residential customers is definitely limited by the number of families. That is probably true in general, and must be seriously considered in future plans. But there may be exceptions. Thus the Pacific States already have a 15 per cent excess, due wholly to a 30 per cent excess in California. But California also reports 50 per cent more automobiles and trucks than families.

With the exception of the Coast the highest percentages of domestic connections are found in the industrial regions; New England has 82.4 per cent; the middle Atlantic States, 81.3 per cent; the East North Central States, 78.5 per cent.

In regions predominantly rural, electrification is far more difficult and has proceeded more moderately. Thus the proportion of residential consumers to families is only 24.0 per cent in the East South Central States, 31.4 per cent in the South Atlantic States and 32.2 per cent in the West South Central States.

The West North Central region, with its mixture of manufacturing industries in large cities and of agriculture with its low population density, very appropriately lies between the two groups, with 57.7 per cent. It is in these less well served regions that the greatest future numerical growth ought logically to occur. Their hope lies in the gradual expansion of great systems that can afford to extend their lines across the land.



*Per cent of families served electrically and number of residential customers at end of 1927*

Most of the data for statistics in the Electrical World are gathered by it from original sources. Privilege is freely given to readers of the Electrical World to quote or use these statistics for any legitimate purpose. While there is no requirement that the source of data be given, yet it would help the Electrical World in obtaining and compiling further basic information if those who make use of these statistics would give credit to the Electrical World.

# Seasonal Increased Production in North Central States

THAT the manufacturing plants of the North Central States witnessed materially increased productive activity during January over those of December is indicated by reports on electrical energy consumption received by the ELECTRICAL WORLD from about 850 large manufacturing plants operating in this section. This increase in operations of about 7.8 per cent appears to be largely seasonal in nature, but is less than the increase recorded during January, 1925 and 1927, but greater than that recorded for January, 1924, and January, 1926. It might be said, therefore, that an average increase in productive operations was recorded during the current January.

The increased operations of general industry during January was due very largely to the materially increased rate of activity recorded by the metal industries, the automobile manufacturing industry and the textile industry, the increased activity of these industrial groups more than offsetting the decreased operations in some of the other industrial groups. During January seven of the section's primary industrial groups—textiles, lumber and its products, automobiles, including the manufacture of equipment and parts; rolling mills and steel plants, metal working plants, food and kindred products, and leather and its products—witnessed productive activities materially over those reported for December, 1927.

*Indexes of Productive Activity in the North Central States*

All Figures Adjusted for Number of Working Days

| | Jan., 1928 | Dec., 1927 | Jan., 1927 | Average for Full Year, 1927 | Average for Full Year, 1926 |
|---|---|---|---|---|---|
| All industries | 116.3 | 107.8 | 105.5 | 114.5 | 114.4 |
| Chemical and allied products | 82.3 | 99.4 | 92.3 | 100.5 | 112.8 |
| Textiles | 126.3 | 110.0 | 141.0 | 126.1 | 106.4 |
| Lumber and its products | 120.2 | 113.2 | 114.2 | 121.5 | 117.6 |
| Paper and pulp | 105.8 | 129.3 | 119.9 | 110.2 | 110.0 |
| Automobiles, including parts and equipment | 135.8 | 106.4 | 78.2 | 110.1 | 113.7 |

## *Limited Dividends*

THE president of the American Telephone & Telegraph Company, Walter S. Gifford, has announced a definite policy of no further increase in dividend rate on the common stock of the world's largest public utility. In adopting this policy he said to stockholders:

"Earnings must, of course, be sufficient to permit the best possible telephone service at all times and to provide a reasonable payment to stockholders with an adequate margin to insure financial safety. Earnings in excess of these requirements will either be spent for the enlargement and improvement of the service furnished or the rates charged for the service reduced. This is the fundamental in the policy of the management."

If the earnings are limited through voluntary rate reductions or adjustments, a stabilizing factor is introduced. This is not a new thought for utility men but is unusual because it has been applied by such a large company. Several chief executives of electric light and power utilities have succeeded in inaugurating a similar policy in their organizations, and possibly more will find it advantageous to follow these examples. The telephone company and the electric light and power industry are outgrowing the speculative age and, as befits the maturity of their development, are settling down to the task of supplying to their customers the fundamental thing that they have to sell—service.

* * * *

## *Apologia Is Not Advertising*

THE man on the curb is not favorably impressed with public utility advertising that resorts to either apologia or braggadocio. Neither appeals to the public. Apologia is not advertising. In the public prints it excites suspicion. "What have these people been up to that they thus sprinkle themselves with sweet perfume?" asks the cynical "Vox Pop." And if he happens to remember his high-school excursions into the classics of our tongue he may add: " 'Methinks the lady doth protest too much' !" Braggadocio is even worse. To publish encomiums on one's own courage, integrity, vision, leadership, consummate skill, unfailing efficiency and splendid zeal arouses not admiration but a species of pity. Men in whom these attributes are inherent do not openly advertise them.

Unquestionably good-will advertising designed to checkmate action which might result in any degree of nationalization of the electric light and power industry is desirable and important. Certainly something should be done to preserve the industry from becoming a political football. But boasting, apologizing and reiterating the high-sounding phrase "freedom of individual initiative" is a wrong and harmful way to go about it. A better way is to tell the public in direct, vigorous and persuasive advertising of the almost miraculous advantages of electric service—in other words, to sell the electric idea. Broadly, this has never been done. It should be done now. When the public are made truly conscious of the blessings which accrue to them from electric service they can be relied upon to protect the source of that service.

## *Temperance and Conciliation Needed in the Bay State*

BAY STATE power companies are under heavy fire on Beacon Hill. The Department of Public Utilities is seeking a guarantee of continued regulation of these properties through company assent to a proposed legislative act which industry leaders assert would abrogate their constitutional rights—guarantee, because the board fears that if the United States Supreme Court should sustain the reproduction-cost rate base on final appeal of the Worcester Electric Light or any other company, regulation in Massachusetts would become a hissing and a byword.

The Worcester appeal to the federal courts apparently brought this matter to a head, although the chairman of the commission maintains that the proposal has been under more or less open consideration for several years and that the board is actuated by a desire to safeguard the consumer against possible exploitation in the form of increased rates on properties lately acquired by nonresidents of the state. This Banquo ghost of rate increases leers horribly across the commission's table, but it is bound to fade from sight when the daylight of promotional rate successes in other jurisdictions sweeps away the shadows of flat-rate limitations from the council chamber of this hard-working but overanxious tribunal.

We do not believe that regulation in Massachusetts is in desperate case because a single company is exercising its legal rights in asking the courts to pass upon the fairness of a commission decision. The Worcester company's rate and dividend policies have been both criticised and defended within the industry itself; but do this and other rate situations in the Bay State call for such a remedy as nullifying the constitutional right of court appeal by signing it away virtually at the point of a pistol? It is difficult to believe that the Massachusetts Legislature will enact such a measure into law at this time, in view of its many objectionable features, including its questionable economic soundness, its dubious effect upon credit and investment values, its threatened impairment of surplus and its repugnant requirement of contract under duress.

Despite confidence that ultimately the situation will be adjusted, just now it is not a pleasant one. Bickering and strife lead nowhere but to confusion, and there is need for some one to take the commission and the utilities by the hand and say, "Come now and let us reason together." Certainly, our highest court does not "promote greed and gluttony," and one who contends for his legal rights is not a "hog." A little more tolerance and consideration on the part of both the commission and the utilities will lead to understanding and to a way out. The issue is too serious and the consequences of hasty action are too great to be decided in any other way. The Commonwealth of Massachusetts, we are sure, does not seek to confiscate property or to deal unjustly with public utility corporations. It has not done so in the past and has hardly become socialistic now. Neither do the utilities, if they are wisely managed, seek to charge rates out of all proportion to the value of the service. What differences exist should be quickly adjusted and composed in keeping with the spirit of regulatory law and to the mutual advantage of consumer and producer.

* * * *

## *Research Not Foreign to Operation*

IMAGINATION allowed to run rampant may seldom be productive of anything commercially applicable, but who can say this of directed, logical speculation on the course that electrical development will take? Successful research requires physicists with imagination. Business is demanding sales managers with imagination to develop new markets. Then why should not every one in a field as fertile for development as electrical engineering stimulate and exercise his imagination? This is particularly needed because of the advances which are being made in electron control—a phenomenon not confined to radio communication by any means. Virtually every electrical problem with which light and power companies are trying to cope involves electron control.

Manufacturers' engineers who are in close touch with research laboratories are not likely to overlook the visualization of ways in which scientific developments may modify present methods of production, transmission and control of electrical energy. But the practical-minded operators of electrical systems are not prone to speculate. As a consequence they may extend systems in such a manner that it will be very costly to adapt them to new and desirable discoveries. If the operators who think in terms of economy and the practical needs of their companies would delve into the results of research occasionally, perhaps they could suggest to manufacturers ways in which present physical knowledge could be combined to serve commercial needs even more than now. At least such studies would prepare them to handle power applications of electron control knowingly when they arise.

For example, who can say that we may not have an electron control device some day that will combine a power rectifier and circuit breaker for feeding Edison systems? Research pointing in this direction has been reported. Again, with a d.c.-a.c. tube working on the electron-control principle and delivering alternating current of adjustable frequency, the speed of ordinary induction motors could be gradually raised from zero to maximum without loss of torque and without complexity of control, opening the field for direct-current transmission and simple motor and control apparatus if they are desirable for train operation. Since arcs involve the discharge of electrons from one conductor to another and since research indicates that electrons can be controlled, would it be unreasonable to expect that entirely different insulators might be developed?

These dreams are just indicative of others that may materialize into commercial realities if engineers outside laboratories and manufacturing plants will study research results and add their ideas to those of the manufacturers and scientific workers.

## *"Shoestring" Tie-ins Challenge Engineering Analysis*

BETWEEN many adjacent utility systems are interconnections whose usefulness is taken for granted when there should be a rigorous inquiry into their justification. A vast difference exists between low-capacity frontier contacts and intersystem ties or interstation trunks that serve for transfer of substantial blocks of energy. In many cases the limitations of low-capacity tie lines are so great that they cut virtually no figure in regional operations. Sometimes they actually prevent territorial load dispatching along the high-grade lines now regarded as standard practice.

Such ineffective "shoestring" tie-ins should be checked regularly by engineering departments and a program outlined providing for their retention, their future development or their abandonment for salvage. The substitution of interplant and intersubstation trunks for such lines has been effective in some quarters in providing adequate channels for transfer of energy and improvement of service continuity and voltage regulation.

* * * *

## *High-Frequency Freaks*

ONE of the byproducts of the development of high-frequency equipment for radio transmission, and particularly of the recent tendency to shorter waves and higher frequencies, is the interest aroused in many unusual and striking physical, chemical and biological effects of high-frequency electric fields. The general character of these effects has been known for many years and was emphasized by the experiments of Sir Oliver Lodge and Tesla, not to mention numbers of others. As the equipment of these early investigators was usually of limited capacity, the amounts of energy associated with the high-frequency phenomena were small and their application was limited to laboratory demonstrations and therapeutic effects.

However, the development of the electron tube has afforded a high-frequency generator of high capacity, and recent reports from the General Electric research laboratories refer to a 15-kw. oscillating tube and circuit in which the energy is radiated into space from a copper bar a few feet long and at frequencies of the order of fifty million cycles per second. This equipment is remarkable and noteworthy because of its high rating and the extreme concentration of energy radiation in the neighborhood of the short antenna. It will undoubtedly be a powerful instrument for the study and development of short-wave radio transmission.

Very striking results are reported from the electrical disturbances caused in proximity to the tube, and particularly such phenomena as standing unipolar electric arcs, the cooking of food and the warming of the blood of persons standing near by. It is suggested that the last-named phenomena may have a useful medical and therapeutic value. It is interesting to note that the phenomenon of high-frequency fields warming the blood was apparently first noted by Wood and Loomis and reported in the *Philosophical Magazine* for September, 1927, using similar equipment and frequencies in the neighborhood of a hundred million cycles, but of very much lower rated output. It is possible that some of the other manifestations of concentrated radio energy may find useful application.

* * * *

## *Appliance Servicing an Obligation— But Whose Responsibility?*

NO CENTRAL-STATION company, regardless of how energetically it merchandises appliances, expects or wants to do all the selling in its territory. In fact, utility companies welcome other dealers and hope to see their sales volume grow. What the central-station companies do not like to see is the failure of dealers in their territory for whatever reason. Such failures act as a damper on all appliance selling. As servicing seems to be the rock upon which many dealers founder, would it not be good business for the central-station companies to act in a standby capacity in this matter of servicing?

If a local power company lets its customers know it can be depended upon to keep their electrical appliances in operation, it will greatly increase the confidence of prospective purchasers. Many companies are already tacitly doing this. The Detroit Edison Company, has organized service departments which answer trouble calls and make repairs on all household appliances regardless of where these were purchased. Such a service need not be extended to substandard equipment. This practice would automatically discourage the sale of devices of questionable merit. It would give the central-station company more effective supervision of the kind of appliances being sold to its customers. It would encourage the responsible dealer to know that he had the local utility company back of him. It should encourage the manufacturer to make a device requiring a minimum of service.

Whether or not and how servicing is to be charged for, it appears that the electrical industry eventually will be obliged to assume the major part of the responsibility. If this responsibility and control were centered in one place — the electric utilities — it would be a long step forward in stabilizing the electric appliance business and reducing the cost of individual services.

* * * *

## *Greenwood's Appointment Is Good News*

THERE is good promise in the appointment of C. Ernest Greenwood as commercial director of the National Electric Light Association. After more than a year of discussion and deliberation, the job has found the man. It was a difficult place to fill. It needs a man who understands the N.E.L.A. and how it works and can establish leadership in harmony with traditions and established practices. Greenwood has had years of active committee work for background. It needs a man who can help carry forward the two pressing commercial objectives that are at the forefront at the moment—the adequate wiring of homes and the development of better trade relations. For, to speed the building of domestic load, facilities must be provided for the use of more appliances in the 17,600,000 incompletely equipped wired homes and for a more effective flow of electrical merchandise into those homes from all the natural neighborhood sources of household supply—department stores, hardware stores, drug stores, as well as electric shops and central-station salesrooms. Greenwood has led the recent movement for better understanding and co-operation between the trades and as chairman of the N.E.L.A. Commercial Section merchandising committee and head of the appliance department of the Boston Edison company has had appropriate training. Fortunately, in Boston he also for a time was in charge of negotiations for service to new buildings and isolated plants, and prior to that he served in the statistical department in rate analysis problems. His experience is, therefore, well rounded and comprehensive.

The establishment of a commercial director at N.E.L.A. headquarters is just another sign of the quickening interest of the industry in the importance of the sales function. It should greatly strengthen and accelerate the work of the Commercial Section, because it will bring continuity of effort to committee activities and the co-ordination of purpose that is only possible when some one with responsibility and initiative carries on from year to year.

* * * *

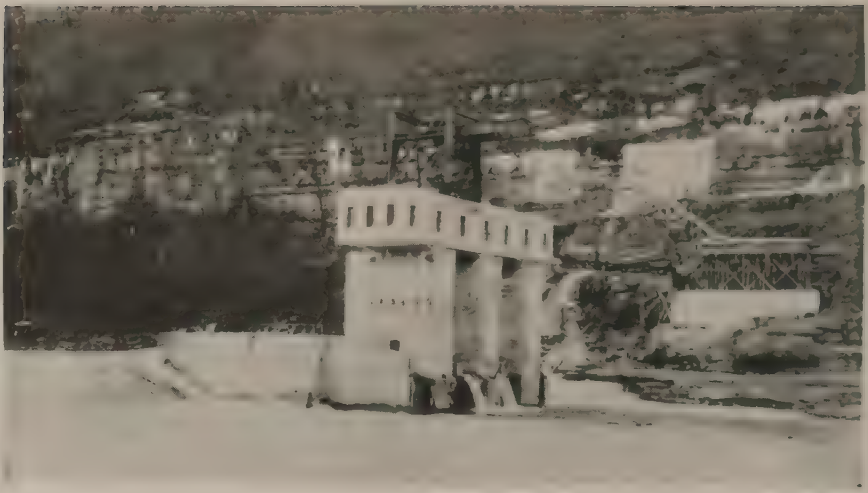
## *"Totin' Together"*

"TOTIN' TOGETHER" means carrying the load together, each one doing his share of the job. Just as it is possible for one man to slack off and make his team mate do more, so is it possible for one of two interconnected electric systems to shirk its portion of the mutual service responsibility. Manifestly it is impossible to cover in an interconnection contract all of the operating conditions that may arise. Any attempt to do so would result only in a contract that would fail in its purpose because of complexity. Unless an interconnection contract represents an agreement between two or more systems that will voluntarily "tote" the load together, the contract is hardly worth the paper it requires. Without this attitude there are plenty of ways in which the spirit of the contract may be encroached upon without transgression of the letter.

Interconnections might better be dissolved than to have the parties to them observe only the letter of the law. For example, what value would written agreements have if, because relay settings were not mentioned, relays were adjusted by one party to free itself of entangling alliances when trouble occurred on the connected company's lines? It would not compensate for failure to give relief merely to express regrets because the system broke loose or to protest most strenuously that the cause of the separation was a mystery. Just because meters at an interconnection point are not equipped with ratchet registers one party is not warranted in trying to trade back off-peak energy for on-peak kilowatt-hours. A few such evasions of moral obligation have regrettably occurred and probably will arise again, but they are not in keeping with the spirit of interconnection.

With all the opportunities for evading written agreements, which an ingenious mind may devise, it is almost futile to guard against them in interconnection contracts. The full benefits of interconnection are more liable to be realized if two systems will join hands with the simple statement that they will be square with each other and will work out their common problems in a spirit of fair play.

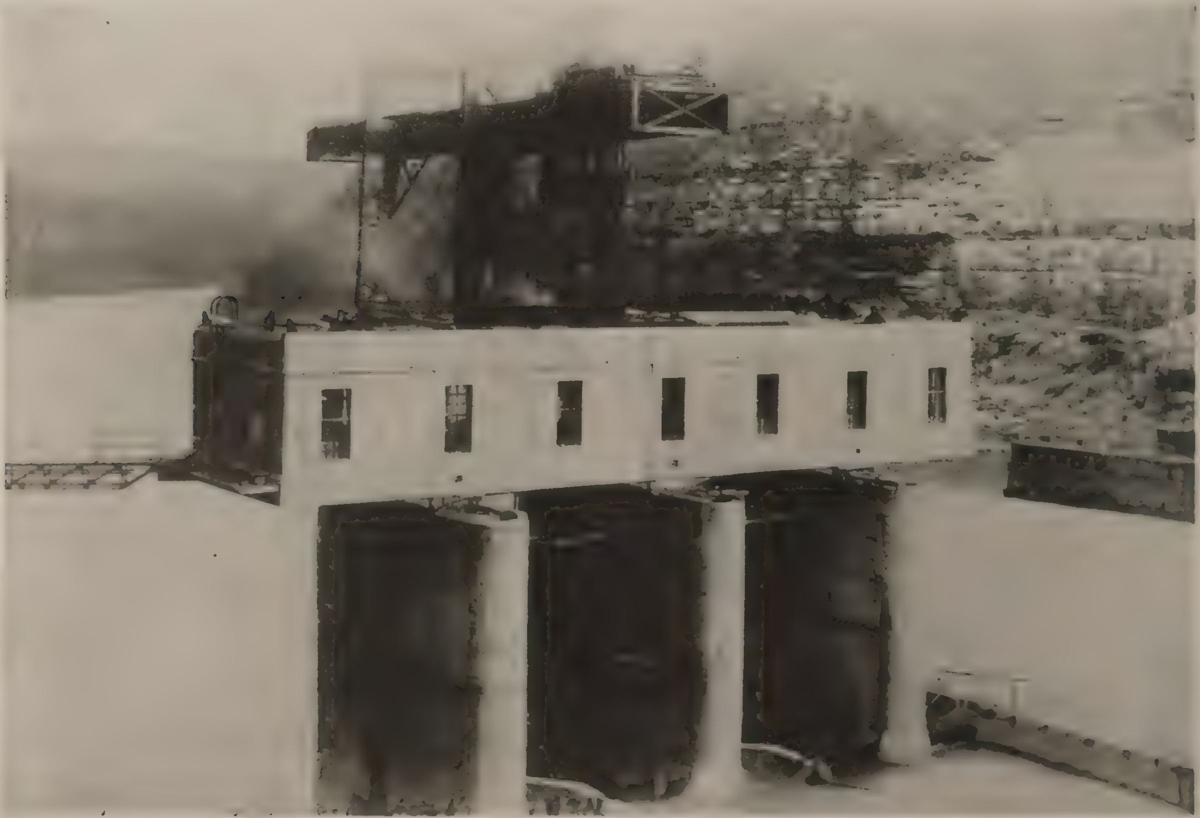
# *A Hydro-Electric Plant on Stilts*



THIS unusual plant, shortly to be completed for the Kentucky Hydro-Electric Company at High Bridge, Ky., was designed to comply with topographical conditions at Government Lock No. 7 on the Kentucky River. The valley is so narrow that there was not room for a plant beyond the end of the dam. Furthermore, the spillway could not be restricted because of the sudden and violent floods which occur.

In the lower part of the plant, over which floodwaters will flow, are the floodgates, draft tubes, etc. The generators and electrical control are in the upper section well above high water. The piers house the shafting and some auxiliary machinery. Equipment is handled through hatches in the roof by the outdoor crane. Transformers and switching equipment will be located on the left bank of the river and connected to the plant by a light foot bridge shown below at left of plant.

The equipment involves three 650-kw. generators driven by 150-r.p.m. propeller-type turbines, operating at a maximum head of 15 ft., and will be controlled from the Dix Dam power house, more than 3 miles away, by supervisory control.



# 220-Kv. Carrier-Telephony

### Southern California Edison Company installation covers over 270 miles of 220-kv. transmission line: Single-frequency duplex system with selective ringing used

By Roy B. Ashbrook* and Ralph E. Henry†

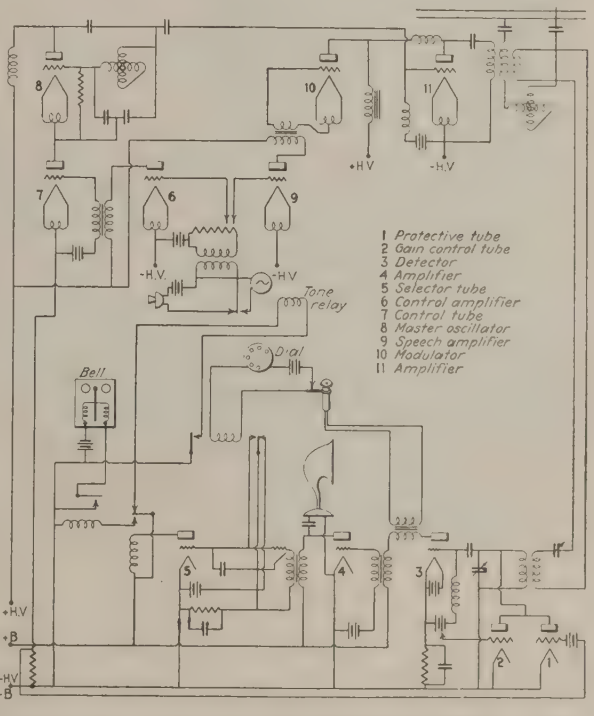
*Southern California Edison Company, Los Angeles, Cal.*

POWER companies have followed with keen interest the rapid development of carrier-current telephony over transmission lines. Interest was further stimulated when the development reached the stage where many of the advantages of wire line communication could be enjoyed. Carrier-current equipment now permits of duplex operation, selective calling, full "party line" communication, wire line extensions and intersystem connections. The method of coupling the equipment to the transmission line has simplified the installation problem considerably; concentrated capacity coupling has marked advantages, in most cases, over the antenna type, and coupling condensers may be installed with the same degree of facility as power equipment. Installation of the radio-frequency line between the capacitors and the equipment has heretofore presented some difficulty at congested stations. This has been overcome by the development of tuning units which permit the use of lead-covered cable run underground. Thus the terminal equipment may be placed in the most advantageous location to meet operating requirements and station or office design limitations.

Having in view the many advantages offered by carrier-current telephony over transmission lines, and for the purpose of studying its operation to determine to what extent it would supplement wire line communication, the Southern California Edison Company placed two General Electric type CC3D sets in operation over its 220-kv. transmission lines. Installation was completed Oct. 1, 1926, and the circuit has been used continuously by the load dispatchers since that time. One set is installed at Big Creek power house No. 3 and the other at the Laguna Bell substation, the latter station being 270 miles from Big Creek and 15 miles from the Edison Building in Los Angeles. A type CC61 extension connects the primary carrier equipment at Laguna Bell to the load dispatcher's office in the Edison Building over a private open wire telephone line and gives the dispatcher remote control of the carrier equipment.

The primary carrier equipment is connected to the 220-kv. system through two General Electric 220-kv. oil-filled capacitors of 0.001 mfd. capacity each. The high side of these capacitors is connected directly to the "A" and "B" phases of the operating bus and the low side through suitable protective equipment to the primary sets. One of the accompanying illustrations shows the condenser coupling installation at Laguna Bell. The carrier equipment of Laguna Bell is temporarily installed in a small steel building approximately 300 ft. from the 220-kv. bus. The location of the capacitors with reference to the bus permits phase connections to be easily shifted. At Big Creek the equipment is installed in the emergency telephone house, some 250 ft. from the 220-kv. bus. The capacitors are connected to the bus in the same manner as those at Laguna Bell.

The primary equipment embodies what is known as "single-frequency" duplex operation with selective ringing." This single-frequency duplex operation can be explained as follows:



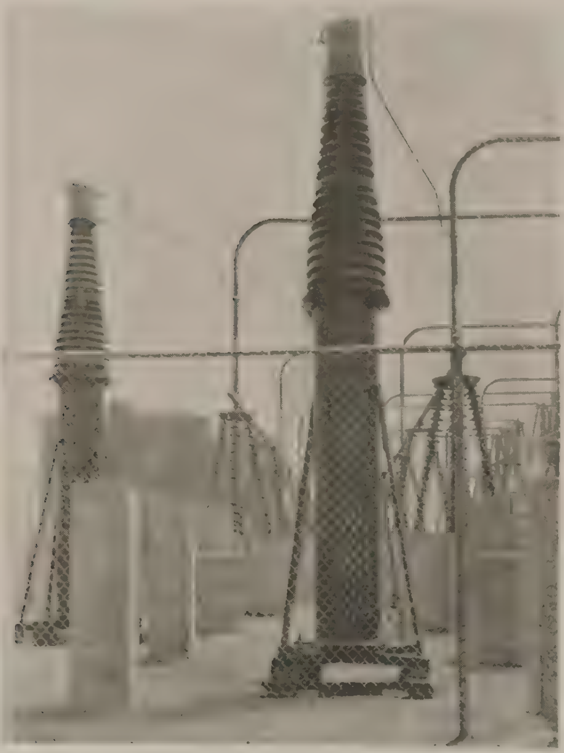
*Condensers couple this carrier-current telephone equipment to 220,000-volt transmission line*

If two stations are arranged to communicate by carrier-current telephony they may, by using different frequencies and each having a receiver tuned to the other's transmitting frequency, carry on a duplex, or two-way, conversation. That system would be called two-frequency duplex carrier-current telephony. With both stations tuned to the same frequency it is evident that the transmitter must be inoperative during reception and that the receiver be disconnected or otherwise protected from the transmitter during transmission. If this is accomplished by manual operation of a switch each time it is desired to change from transmitter to receiver the service would be called single-frequency simplex carrier-current telephony. If by some means the transmitter could be caused to operate whenever an audio signal of sufficient intensity reached the microphone, and to cease to operate at the end of the audio signal, and if the receiver could be made operative at all times except when the local transmitter was actually operating, it would be possible to carry on a two-way conversation, as on any wire phone using one frequency. The system is called single-frequency duplex.

---

*Communication engineer. †Department of engineering design.

The outstanding advantage of the single-frequency duplex system is that a number of stations can enter into a full "party-line" communication. Thus, a dispatcher and several other stations may be in full communication with each other at one time, each being able to talk to all the others and each being able to hear the speaker.



*Capacitators link communication system to high-tension lines*

Specifically, the General Electric Company type CC3D set used by the Southern California Edison Company is designed to give duplex conversation between similar sets, using the same frequency for transmission and reception. It is designed to be a multipower set; that is, the transmitter may be operated at three power levels, namely, 7½, 50 or 250 watts. The power supply is a 125-volt storage battery driving the necessary motor-generator sets.

The transmitter is composed of a master oscillator, control tube amplifier, control tube, speech amplifier, modulator and power amplifier tubes, together with the necessary circuit accessories. For duplex operation the master oscillator must operate with each audio signal above a certain intensity (room noise) and must cease to operate at the end of this sound. This is accomplished by means of the control tube in the following manner:

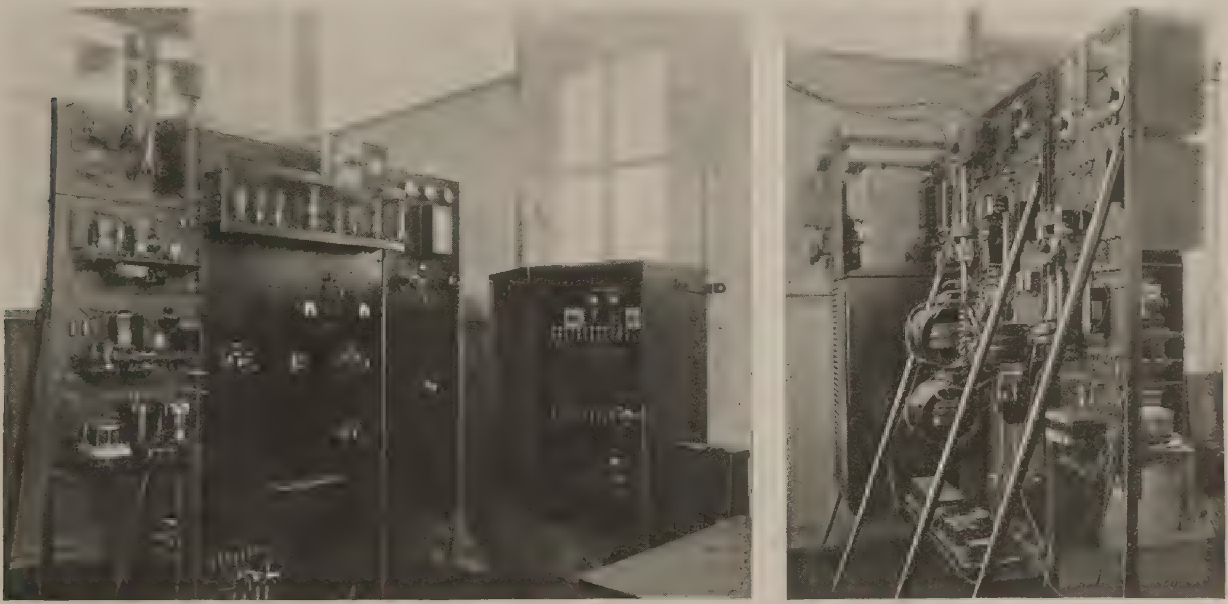
The control tube plate is connected to the filament of the master oscillator and the control filament returns to negative high voltage. There is, of course, positive high voltage on the master oscillator plate. The two tubes are, therefore, in series and a very high bias is normally on the control tube grid. Therefore, while "standing by" practically all of the voltage drop is across the control tube and the master oscillator cannot operate. When an audio signal of sufficient intensity reaches the microphone it is amplified by the control tube amplifier and impressed on the grid of the control tube. This lowers the resistance of the control tube, allowing more current to flow through the master oscillator, which causes it to operate. The audio-frequency signal (voice or "tone") is simultaneously amplified and impressed upon the output by the Heising system of modulation.

### FEATURES OF RECEIVING EQUIPMENT

The receiver is practically a standard two-circuit receiver without regeneration or radio-frequency amplification. Sufficient signal is received from the transmitting station to permit using a detector tube only for the reception of speech, thus avoiding the amplification of noise. The protection of the receiver against the high voltages induced during transmission and the automatic gain control of the received signal are the only uncommon principles involved. Two tubes, known as the protective tube and gain control tube, have their plates in parallel and connected to one side of the secondary inductance of the receiver and their filaments to the other side of the same inductance. The grids are normally held slightly negative by separate bias batteries. The filament return circuit of the master oscillator flows through a 1,000-ohm resistance to negative high voltage. When the master oscillator draws plate current there is a voltage drop across this resistor. The grid of the protective tube is connected to the positive end of this resistor, which means that a positive bias is impressed on it, and the protective tube becomes a very low impedance which shunts and detunes the secondary tuned circuit, thus protecting the receiver from abnormal voltages. The operation of the gain control tube is quite similar to that of the protective tube, except that its grid potential is controlled by the drop across a 3,000-ohm resistor in the filament return of the detector tube to the negative of the plate supply. A separate six-volt filament battery is used on the detector tube to isolate it from the other tubes in the receiver.

For calling, one stage of amplification and what is known as the selector tube are used. The selector tube has a Wheatstone relay in the plate circuit, the plate current being biased to zero. When the 500-cycle dial-interrupted tone is received the plate current is increased, causing the Wheatstone relay to operate a selector relay, which, upon receiving the proper combination, rings a bell.

The type CC61 remote-control extension between Laguna Bell substation and the dispatcher's office in the Edison Building, Los Angeles, is a combination radio and audio channel. If audio, or, in other words, a standard telephone channel, were used, it would require two pairs of wires, since the inherent characteristics of the primary carrier necessitate the keeping separate of the transmitted and received signal. This, of course, could be accomplished by using a hybrid coil and balancing network on one pair. In fact, this method was employed prior to the delayed receipt of the CC61 extension.



*Front and rear views of instrument panels for carrier-current telephone of Southern California Edison Company*

Front view of board shows metal cover removed from four-section panel on left.
Equipment in small cabinet on right is for remote-control extension to dispatcher.

The present extension transmitting unit located in the dispatcher's office is a low-power carrier-current transmitter, employing a 7½-watt oscillator and a modulator tube of like rating. The filaments are lighted by alternating current and the plate supply is obtained from a half-wave rectifier tube. To assure continuous service the 110 volts a.c. for filaments and plate supply rectifier is obtained from a 100-watt, 110-volt alternator direct connected to a d.c. motor operating from a 32-volt storage battery.

The extension receiver unit, located in the same building with the primary carrier at Laguna Bell, utilizes a detector tube and one stage of audio amplification. The detector tube has in its plate circuit a sensitive polarized relay. The plate current is biased down to about 1 milliampere. When the dispatcher starts the extension transmitter unit by lifting his receiver from the hook radio-frequency current is sent over the phone line, which causes the detector to pass more plate current, and the polarized relay operates. Associated relays are in turn energized by the polarized relay and the primary carrier equipment is started. Replacing the receiver on the hook shuts down the set by releasing the relays which function during operation.

### Operation of the Equipment

Over a period of eight months a careful record was kept of all interesting details of the operation of the equipment. Operations averaged 50 per day. Transmission tests were made from time to time, under varying line conditions, covering the entire frequency band of the equipment, i.e., 150 kilocycles. Sixty kilocycles was selected as the optimum operating frequency for the Edison system. As yet by-pass condensers at the various switching points between Laguna Bell and Big Creek have not been provided. However, communication has been maintained under very adverse line conditions. One rather severe test was made, as follows:

The carrier equipment at Big Creek was connected to the east line and the Laguna Bell equipment connected to the west line. The west line was energized and the east line was dead. Proceeding as shown in the following, satisfactory communication after each operation was established:

(a) Opened oil switches in the east line at three intermediate points, namely, Eagle Rock, Magunden and Vestal.

(b) Opened disconnects at the same three intermediate points.

(c) Shorted and grounded each line at each point.

Although under the above conditions it was found that 250 watts put through the best signal, it was possible to communicate satisfactorily on 7½ watts. Results of this test were quite pleasing. The manufacturer had offered no encouragement in the matter of getting through in a case of this kind unless by-pass condensers were installed. It is quite obvious that by virtue of the coupling between the adjacent lines the radio-frequency current was by-passed around the breaks. Should a break occur at the same point in both lines there is no doubt that communication would be interrupted on the carrier system.

Disturbances on the transmission system caused by flashovers, which frequently interrupt wire line telephone service, do not interfere with the operation of the carrier. On several occasions when flashovers have been of sufficient duration the dispatcher has been successful in communicating with Big Creek while the arc was taking place. We feel justified in stating that the carrier phone, because of the inherent strength of the transmission line and the immunity from power line disturbances, offers a very reliable channel of communication. In view of its dependability, the carrier phone adds a valuable supplement to the dispatching and operating communication system and the company expects to expand its carrier facilities from time to time.

# Ice Prevented Along Spillway by Compressed Air

By F. A. Dale
*Hydro-Electric Engineer Indiana Hydro-Electric Power Company, Indianapolis, Ind.*

A COMPRESSED air system for preventing ice formation along spillway flashboards has been in successful operation for two winters on the Tippecanoe River in Indiana at the Norway plant of the Indiana Hydro-Electric Power Company. The flood discharge works at this plant consist of three stony gates and an overflow spillway 225 ft. long. This spillway is a solid masonry dam, the crest of which carries 2 ft. of flashboards supported on conventional steel pins or rods. Pond level is generally carried within 6 in. of the top of these boards, and if ice were allowed to form against the boards they would soon be carried away. In the past an open channel had been maintained along the boards by hand chopping, the men standing on the narrow ledge behind the boards. This work was hazardous and expensive and some improved scheme was sought.

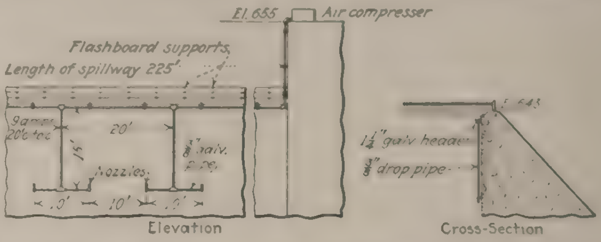
A permanent addition to the top of the spillway was not feasible because of encroachment on discharge capacity and also because the masonry section was insufficient to withstand ice loading at the higher level. Collapsible flashboards set at an angle flat enough to turn the expanding ice were considered, but the cost proved greater than a compressed air system. It was decided, therefore, to keep an open channel in front of the flashboards by means of air discharged under water. Normally no trouble arises from drifting floes of ice because the velocity in the pond is very low and the ice sheet generally melts away in place.

*Ice-prevention system at Norway plant of Indiana Hydro-Electric Power Company*

The average width of the open channel is about 8 ft. The picture was taken immediately after a period when the temperature reached 8 deg. below zero for four days. The ice on the pond was about 6 in. thick. In extreme temperatures of 20 deg below zero the width of channel decreases to about 4 ft.

The location and arrangement of the air piping are shown in the attached elevation and section. The air outlets or nozzles, which are simply pipe caps with proper sized holes drilled in them, were originally spaced 20 ft. on centers, but this spacing allowed ice to form between outlets. The eleven outlets were graduated in size from $\frac{1}{16}$ in. nearest the supply to $\frac{5}{16}$ in. at the farthest outlet. With this graduation too much air was delivered to the far end. The number of outlets was then doubled (making 22) by adding a 10-ft. tee extension at the bottom of each drop, as shown, with an outlet at each end. This placed the outlets 10 ft. on centers. The openings were also decreased in size, with a range from $\frac{1}{32}$ in. to $\frac{5}{32}$ in., increasing away from the source. This arrangement proved satisfactory.

The pressure at the compressor is about 10 lb. per square inch, being equivalent to the hydrostatic pressure at the nozzles plus the velocity and friction losses. It was discovered that a slight slope on the cross tee supplying each nozzle pair would give one nozzle more air than the other. For this reason individual drops to each nozzle would be preferred. Air is supplied by a Worthington-Laidlaw vertical inclosed, self-oiling, feather-valve, air-cooled compressor with 4¼-in. bore and 4-in. stroke. The compressor is belted to a 5-hp., 1,800-r.p.m. motor driving the compressor at 500 r.p.m. and delivers 13 cu.ft. of free air per minute. The outfit is mounted on top of one of the floodgate piers, and although protected from rain and snow by an inclosure no attempt has been made to keep it warm. No difficulty has been experienced with the compressor or air lines due to low temperatures. The cost of compressor and motor amounted to $170, that for the entire installation being $443.



*Open channel maintained above spillway by escaping air*

# Special Alloy Eliminates Erosion of Impulse-Wheel Nozzles

EROSION of impulse waterwheel nozzles, always a problem in high-head plants, seems to have been successfully met by the San Joaquin Light & Power Corporation, Fresno, Calif., by the use of "Stellite," a very hard and tough alloy. At the company's recently completed Balch high-head plant bronze or cast-steel nozzles had a life of from 35 to 40 days only, due to the cutting action of the water.

Although the water is very clean and free from abrasive material it was found that the water passing through the 7½-in. nozzles with a velocity of 360 ft. per second under an effective head of 2,243 ft. had a very decided erosive action on the throat rings and nozzles of the 40,000-hp. double overhung waterwheel. By welding "Stellite" onto cast-steel nozzles no signs of erosion are evident on the main waterwheel nozzles after two months and on the exciter wheel nozzles after six months of operation. The alloy comes in ½-in. rods and is welded onto the steel nozzles with an acetylene torch, after which the nozzles are put into a lathe and ground down with an emery wheel, since the metal is so hard and tough that it cannot be worked with a lathe tool. The work is done by the power company's men on the job at a cost of approximately $75 per nozzle.

# *Simplified*
# Distribution Planning

### Methods of calculating the economic characteristics of electrical distribution systems, particularly transformer spacing and sizes of line conductor

By W. R. Bullard

*Electric Bond & Share Company, New York City*

*The system of planning described by the author was utilized in the rebuilding of an extensive and heavily loaded distribution system in a Southern city. The use of this method permitted the completion of the necessary preliminary calculations in record time, a few weeks sufficing, whereas if other means had been employed the job would have been greatly prolonged. The system has the particular advantage of permitting the inclusion of growth factors, thereby involving another improvement over other similar plans.*

*The primary distribution system of economical design is discussed in this first of four articles by Mr. Bullard. The secondary system will be incorporated in the next two installments. The fourth article will show the actual solution of a specific distribution problem by means of the equations previously developed.*

*As this device may be applied, through the choice of proper values, to any general problem of such character, the development should possess unusual interest.*—Editor.

THE methods of establishing general features of economical distribution system design, with particular reference to conductor sizes and distribution transformer spacing, will be considered in this discussion. Once these features are established for any given system, their application to construction and operation becomes comparatively simple. Furthermore, these features, once properly determined, will usually be applicable for a period of several years without change, unless unforeseen circumstances should arise that would materially change local conditions.

Due to the variable nature of many factors that enter into the problem, it is not possible to reduce economical design to terms of absolutely correct figures. However, if the calculations are based upon reasonably sound general principles and are tempered with good judgment, the application of the results to a particular system cannot result in very great error in the over-all economics. This is particularly true since curves expressing the total annual cost of electrical distribution in terms of the various design factors are generally quite flat in the neighborhood of the point of minimum cost, and therefore small variations from exactly correct characteristics will not result in material changes in the total cost.

The methods described in this article will give approximate results only. However, for the reasons stated, it is believed that by their use sufficient accuracy for all usual purposes can be obtained. The methods given are applicable primarily to radial systems of usual types, but can be applied to automatic low-voltage alternating-current network distribution if the proper assumptions are made.

The writer gratefully acknowledges the assistance of W. T. Hess in offering many valuable suggestions during the preparation of this article, and of Malcolm W. Stumpf and Alfred Hudson in handling the detailed mathematics in the development of many of the equations.

## Preliminary Calculations

The first step in a study of the economics of the characteristics of any given distribution system is the calculation of two factors which will later be used repeatedly in calculations. These are: Copper loss duration factor and unit energy cost.

*Copper Loss Duration Factor.*—By copper loss duration factor is meant a factor that takes into account the shape of the daily and yearly load curves of any particular part of the system and enables the yearly copper loss to be derived from the copper loss at the yearly peak load by a simple calculation. A method of obtaining this factor is as follows:

First, a number of typical daily load curves for the particular territory in question are selected from a complete set of curves representing the whole year. These curves should represent the four seasons of the year and the different classes of days of the week for each season. For instance, curves representing a Sunday, a Saturday and a week day in each of the four seasons might be selected.

After selecting these curves, the next step is to pick values from each curve at equally spaced points of time throughout the day. The values should then be squared, and the squares, thus obtained, averaged for each curve under consideration, each resulting daily average being then multiplied by the number of the corresponding days in the season—that is, the mean square value for the Sunday curve in summer should be multiplied by the number of Sundays in the summer season, etc. The values should then all be totaled and this total divided by the number of days in the year. The resulting value when divided by the square of the peak load will be a fraction which, when multiplied by the copper loss at peak load, will give the average copper loss for the whole year. If the number of hours in the year is then multiplied by this fraction, the result will be a figure which, when multiplied by the kilowatt copper loss at peak load, will give the kilowatt-hour copper loss for the year.

As an example: The load factor in the business district of a large Southern city is approximately 36 per cent. The copper loss factor calculated by the method described is 18.2 per cent, or the figure to be used as a multiplier for the kilowatt loss at peak load to get yearly kilowatt-hours is 18.2 per cent of 8,760, or 1,600. The symbol *f* will be used to designate this latter factor in the equations given in this paper.

This process is rather laborious if a large number of representative curves are used. However, the method is subject to as great or as little refinement as may be desired, this refinement depending upon the number of typical curves that are selected and the number of points taken from each curve. The result is a very useful factor, since it can be used in the solution of many small problems that come up from day to day, as well as in the calculations described in this article.

The load curves of any given district, of course, do not represent exactly the load curves of individual small portions of the district. However, since we are concerned with average conditions and not with individual conditions, the factor derived by the method described will be sufficiently accurate for general application to various individual parts of the system in the district under question.

Since copper loss is a function of current rather than power consumption, the load curves should be reduced to values of kilovolt-amperes rather than kilowatts if convenient to do so. However, if the power factor is reasonably constant, it will be sufficient to use values of kilowatts throughout, since the desired value is a function of the shape of the load curves and not of the absolute values represented by these curves.

*Unit Energy Costs.*—The calculation of energy cost to any great degree of refinement is a laborious process. There are available in published form whole volumes of data concerning the methods and details of making such calculations. In this article, therefore, no attempt will be made to go into minute details of energy cost calculations. A very brief discussion will be given of a method of deriving approximate costs. If greater refinement of calculations is desired, other literature should be consulted.

In a general way it may be said that the costs of energy losses in a distribution system involve something more than bare production costs at the generating station. To obtain the actual production cost of energy losses measured at the point where they occur in the system it is, of course, necessary to increase the amount of these losses to their total value at the generating station, including the losses which they produce while passing through other portions of the system.

In addition to this, however, to obtain the total energy cost it is usually necessary to add a demand charge to the production charge, since in most cases the maximum losses in a general distribution system occur during the peak load of the system as a whole.

### DEMAND CHARGE

The demand charge is in the nature of a charge on system investment in the portions of the system through which the losses have to pass before reaching the coal pile. To be exact, a demand charge should include certain items of operating expense at the generating station and substations. However, it is usually sufficient in calculating the cost of system losses to consider the demand cost as a definite percentage of the capital investment that is necessitated by reason of the additional system capacity necessary to supply the losses. When calculated in this manner, the demand charge should include allowance for interest on investment, maintenance, depreciation, taxes and insurance. To be theoretically exact, the demand charge in such portions of the system as substations, transmission lines, etc., should be calculated on the basis of kilovolt-ampere demand; and in such portions of the system as boilers and turbines should be calculated on the basis of kilowatt demand. However, if, as is usually the case, the power factor of the load in question is high during the peak load, it will be sufficient to use kilowatts as a basis for the entire calculations.

When the production charge and the demand charge have been calculated, these two charges should be combined to form the value for total cost per kilowatt-hour for copper losses and for transformer core losses. This can be done by using the copper loss duration factor in the case of copper losses and by using the total number of hours in the year in the case of transformer core losses.

As an example, assume that the average production cost at the generating station is $0.00665 per kilowatt-hour. The investment in various portions of the system per kilowatt peak load are as follows: Transmission system, $20; generating station, $140; substations, $60; distribution primary, $18. The energy losses at peak load are 5 per cent for substations, 5 per cent for transmission lines and 5 per cent for distribution primary. The yearly energy losses are 5 per cent for substations, 1 per cent for transmission lines and 1 per cent for distribution primary. The total production charges per kilowatt-hour on losses at the distribution transformers are therefore $0.00665 divided by 93 per cent, or $0.00715 per kilowatt-hour. The system investment necessary to serve 1 kilowatt of distribution losses is $18 plus ($60 ÷ 95 per cent) plus ($20 ÷ 90.3 per cent) plus ($140 ÷ 85.7 per cent), or $267.

### FIXED CHARGES

If the fixed charges on investment, including interest, maintenance, depreciation, etc., are 15 per cent of the investment, the demand charge per year per kilowatt loss at peak load is 15 per cent of $267, or $40. Assuming that the load in question has a copper duration factor of 1,600 hours per year, the demand charge for copper losses reduced to cost per kilowatt-hour is $40 divided by 1,600, or 2.5 cents per kilowatt-hour; the cost per kilowatt-hour of copper loss at the distribution transformer is therefore 2.5 plus 0.715, or 3.215 cents per kilowatt-hour. Similarly, using 8,760 hours duration factor, the cost of transformer core losses is 1.17 cents per kilowatt-hour.

These values for investment charges are unusually high due to the geographical location of the system from which they were taken. In the example selected the location of the losses in the system was at the distribution transformers and fixed charges on the primary system were included. For other points in the distribution system the cost of losses would of course be different, depending upon the amount of distribution system through which they would have to pass. Therefore, if a high degree of accuracy is desired, a different cost value should be calculated for the losses in each portion of the distribution system. However, reasonably accurate results can be secured by making the calculations for some mid point in the distribution system and applying the results to all the distribution losses.

In applying the cost of energy to calculations of system economics some engineers consider it permissible to neglect the charges for system investment. The argument is frequently used that the system is already installed and is available for serving load and that the losses form a very small part of the total load. The investment cost of serving losses is therefore assumed to be an imaginary rather than a real cost. Such assumption may be useful if it is desired to hold the distribution system investment down to the minimum consistent with reasonably good service, or, in other words, if it is desired to place a low valuation upon the cost of losses in the calculation of system economics, thereby permitting the installation of a cheap system with correspondingly high losses. Such procedure, however, should be used with great caution, since it may result eventually in increasing the investment in other portions of the system through which the losses have to pass to a greater extent than the investment is reduced in the portions of the system under consideration.

There can hardly be any more doubt that the investment cost of serving, say, 5 per cent of the system load in losses is a real cost than there is that the investment cost in generating station, transmission system, substations and distribution system to serve a 1-kw. customer connected to a large distribution system is a real and not an imaginary cost. The fact that the system may at present have sufficient capacity to take on additional load will not under usual conditions excuse the additional load represented by losses from bearing its share of the investment cost. With the steady growth of main system load additional system capacity must eventually be added and the present addition of any unnecessary load will necessitate the adding of that capacity proportionately sooner than would otherwise be the case.

### PRIMARY SYSTEM

*Spacing of Substations.*—Much has been written about the economics of substation spacing and many formulas are available for the determination of such economics. Therefore no attempt will be made to treat this subject in detail in this article.

*Primary Voltage.*—The primary voltage of existing distribution systems is in many cases fixed by the previous history of the system's installation and growth. Due to the cost of making a change, the original primary voltage is often continued in effect year after year, or if a change is made this is done in such manner as to involve the least cost. However, with the rapidly increasing load densities that are usually encountered under modern conditions, many systems are now being changed to higher primary voltages and the economics of many other systems may demand that a complete change be made in such practices.

The primary voltages now in use for general types of distribution systems (referring particularly to three-phase systems) are 2,300 delta, 4,000 Y, 6,600 delta, 11,000 Y and 13,200 delta and Y.

The 2,300- and 4,000-volt systems are in the great majority and owe their popularity chiefly to the standardization during the past years of 2,300-volt distribution transformers and auxiliary apparatus. The 4,000-volt Y system is a natural outgrowth of the old 2,300-volt system, since by its use the load capacity of the primary conductors of an old 2,300-volt system can be increased 70 per cent merely by reconnecting distribution transformers in Y instead of delta and possibly reinsulating the primary system. For this reason the 4,000-volt system is used extensively in modern distribution practice and in fact during the past few years has almost become standard for three-phase radial overhead systems. However, in some cases economies are now being effected by the use of voltages higher than 4,000.

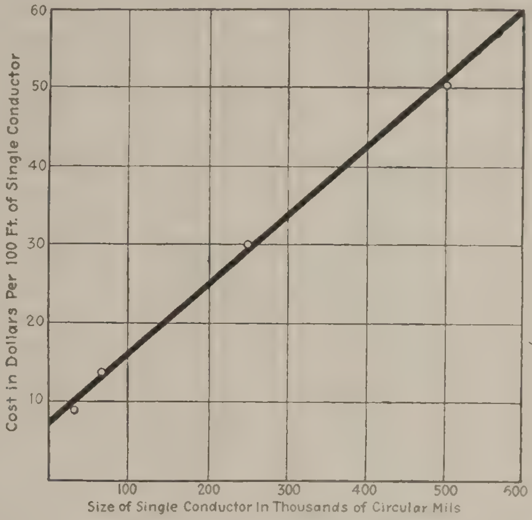


*Fig. 1—Cable costs per conductor based on cost of four-conductor, low-voltage, lead-covered, paper-insulated, armored cable*

The chief advantage of the higher voltages over a 4,000-volt system lies in the fact that generating voltages can be employed and the use of step-down substation can be eliminated (assuming, of course, that the distance of the distribution system from the generating station is not so great as to require a transmission voltage higher than that of the generators). The use of the higher voltages may thus both improve the system efficiency and reduce the investment cost, unless perhaps the higher cost of line insulation and non-standard distribution apparatus should offset the saving made by the elimination of substations. This is seldom the case, however, since the latter saving is usually a very considerable one.

The chief disadvantage of the higher voltages are: First, that under many local conditions it is impracticable to work primary lines of voltages above 4,000 alive, thus necessitating some measure of interruption of service in radial systems when it is necessary to do work on the lines; second, that the natural consequence of the use of higher voltages is the concentration of large amounts of power in individual feeders of the primary system, thus causing interruptions of service to a comparatively large number of customers in radial systems in case of a primary short circuit or other trouble affecting the primary feeder; third, that governmental regulations in many cases prohibit the use of the higher voltages in overhead line construction in the city streets; fourth, that it is sometimes difficult to obtain the proper clearances necessary for the higher voltages in overhead construction, and, fifth, that the communication companies object to joint construction when certain of the

## *Symbols Used in the Development of Equations in This and Following Installments*

**$a$ = Cross-section of each line conductor in thousands of circular mils.**

$b$ = Size of conductor in thousands of circular mils necessary to carry 100 amp. from heating standpoint.

$C$ = Cost of copper loss expressed as a fraction of a dollar per kilowatt-hour. For accuracy the value of $C$ should be different for the different parts of the distribution system. However, sufficient accuracy may usually be obtained by calculating $C$ for some mid point between the substation and the customer's service and applying the value thus obtained to all parts of the distribution system.
NOTE: In systems where it is possible to keep transformers very nearly uniformly loaded and symmetrically spaced, the calculated value of $C$ should be reduced by 25 per cent before insertion in the equations.

$C_1$ = Yearly cost of each transformer installation, including cost of losses and fixed charge on investment in dollars per installation per year. Cost independent of size of transformer.

$C_2$ = Annual fixed charges on investment in line conductors, exclusive of installation costs and including only that portion of the cost which is directly proportional to the size of conductors, in dollars per year per thousand circular mils per 100 ft. of single conductor.

$C_3$ = Annual fixed charges on average total investment costs of primary laterals in dollars per year per 100 ft. of complete circuit.
NOTE: For alternating-current, low-voltage network systems of the full automatic type, the calculated value of $C_3$ should be multiplied by the factor $(3 + x) \div 4$ before insertion in the equations. $X$ equals the number of primary circuits feeding a single network.

$C_4$ = Cost of core loss expressed as a fraction of a dollar per kilowatt-hour.

$C_5$ = Annual fixed charges on cost of transformer installation, including cost of installing, purchase cost of transformer independent of size, cost of auxiliary equipment installed and cost of housing if any.

$D$ = Load density at yearly peak load in amperes per 100 ft. per current-carrying conductor of secondary mains, exclusive of large concentrated loads.

$f$ = Yearly duration factor for copper loss in equivalent hours per year for loss at peak load.

$I_F$ = Current density at peak load in primary feeders in amperes per 1,000 circ.mil.

$I_L$ = Current density at peak load in primary laterals (maximum current or current at end toward primary feeders) **in amperes per** 1,000 circ.mil.

$L$ = Average length of each side of a block in 100-ft. units.

$n$ = Number of current-carrying conductors in secondary mains, assuming balanced current.

$n_1$ = Total number of conductors in secondary mains, assuming neutral conductor to be same size as current-carrying conductors.

$V$ = Maximum volts drop per conductor in secondary mains.
NOTE: In systems where it is possible to keep transformers very nearly uniformly loaded and symmetrically spaced, the value of calculated voltage drop obtained from the equations should be reduced 25 per cent, or the value of estimated allowable voltage drop $V$ for insertion in the equations should be increased 33 per cent.

$W$ = Power loss in kilowatts per 100 ft. per current-carrying conductor of secondary mains.

$W_1$ = Transformer copper loss in kilowatts per transformer installation, independent of transformer size.

$W_2$ = Transformer core loss in kilowatts per transformer installation independent of transformer size.

$X$ = Number of primary circuits feeding a single network in a full-automatic, low-voltage alternating current network system.

higher voltages are used. Both of the first two objections to the use of higher primary voltages can be somewhat offset by the use of a higher factor of safety in line construction and by the installation of sectionalizing devices of both manually operated and automatic types, so as to break up the primary circuits into smaller units, both for purposes of working upon lines and for short-circuit protection. Both the increased cost of the higher grade of construction and the use of additional apparatus, of course, tend to offset the saving effected by elimination of substations.

Assuming that the last three of the five objections mentioned can be overcome, it may be said in general that the selection of high primary voltages in order to obtain the economies afforded by the elimination of substations involves mainly the question of the importance of reliability of service. If a somewhat less degree of reliability of service can be tolerated, then usually it is advantageous to select the higher primary voltages, the result in most cases being a saving in investment and improvement in system efficiency. This statement, of course, applies to radial systems and not to multiple-feed, low-voltage networks. In the latter type of systems reliability of service is assured by the automatic features of the system and the chief objections to the higher primary voltages are thereby eliminated, particularly since low-voltage network systems usually involve underground construction and therefore the last three objections mentioned do not apply.

*Determination of Loads of Individual Feeders.*—The determination of the loads of individual feeders for a radial distribution system is something more than a question of economics. Theoretically the most economical size of feeder would involve concentrating as much load on a single feeder as geographical considerations and distances of feed would permit. However, the question of reliability of service is an important factor in the problem and the requirement for greater service reliability is that the primary system be split up into units of very small size. The actual selection of the loads of primary feeders must therefore usually be based upon a compromise between economy and reliability of service. This becomes largely a matter of judgment concerning the importance of the reliability of service in any given system. If small primary feeders are used, relatively small portions of the system will be affected by a single primary short circuit, but the investment cost in the system will be comparatively great. If large units are used, the cost will be reduced, but larger areas will be affected in case of primary short circuit.

There are, however, certain other factors that enter into the problem—namely, available standards of feeder terminal equipment and local geographical conditions.

By feeder terminal equipment is meant such apparatus as induction regulators, feeder circuit breakers, etc. Such equipment has been fairly well standardized, and in general it will be found that a reasonable compromise between service reliability and economy can be made by the selection of feeder loads to fit existing equipment standards. Such selection will, of course, result in a lower relative cost of the terminal equipment than if non-standard sizes are used.

Geographical conditions may also sometimes play an important part in the determination of feeder loads, That is, in some cases the configuration of the system and the geographical distribution of the system load may be such that primary circuits will fall naturally into certain uniform units of load.

The above discussion of course applies to radial systems of distribution. In the case of multiple-feed, low-voltage networks the conditions are somewhat different. Here the reliability of service is reasonably independent of the number or size of primary feeders and it is possible in many cases to work out mathematically the proper size of feeder from considerations of economics. The mathematical solution of this problem is quite complicated and will not be included in this article.

*Voltage Drop and Current Capacity vs. Economical Current Density.*—The above discussion relates to the determination of the loads for which primary feeders and circuits are to be designed. So far nothing has been said concerning the size of copper which should be used in the primary feeders to handle a given amount of current. In the solution of this problem three factors must be considered—namely, economical current density, voltage drop and current-carrying capacity.

The investment cost of primary lines is made up of two parts, one being a value that is practically independent of the size of copper and which, therefore, does not enter into the problem. In overhead lines this includes poles, hardware, insulators, etc., and in underground lines conduit, manholes, cable insulation, lead sheath, etc. The costs of such things as cable sheath, cable insulation, etc., in underground lines are not entirely independent of the copper size. However, by plotting cost per unit length of line against copper size a curve can be obtained which is usually very nearly a straight line. In Fig. 1 the point where this curve cuts the cost axis represents a cost that is entirely independent of the copper size, and this cost, therefore, does not enter into the calculations of economics. The slope of the curve, however, is a measure of the variation of cost with copper size and is very useful in determining the economical current density.

If $I_F$ represents the current density at peak load in amperes per 1,000 circ.mil of conductor cross-section; $C_2$ represents the fixed charge in dollars per year on the cost of copper per 100 ft. of conductor per 1,000 circ.mil; $C$ equals the cost of copper loss in dollars per kilowatt-hour, and $f$ equals the duration factor previously described, then the total variable yearly cost per ampere of load per 1,000 circ.mil cross-section per 100 ft. of conductor, including fixed charges on investment and cost of copper loss, is given by the expression $C_2 \div I_F + 0.0011CfI_F$, where 0.0011 is a factor determined by the resistance per 100 ft. for 1,000 circ.mil cross-section, a reasonably high temperature of copper being assumed.

In order to obtain the value of $I_F$ for minimum cost, it is merely necessary to use the familiar method of differentiating the expression of total variable cost and equating the result to zero. This gives

$$I_F = \sqrt{\frac{C_2}{0.0011Cf}} \qquad (1)$$

This formula can be used for calculating the economical current density in a primary feeder. It may be, however, that for given system conditions the use of the economical size of copper would give a greater voltage drop than can be permitted. Therefore, after calculating the economical current density, the resulting values should be tested for voltage drop in the individual feeders. If the result of this test is a greater voltage drop than permissible, then the proper current density must be determined by calculation from allowable voltage drop, unless the current-carrying capacity of the copper as limited by temperature should still further limit the current density.

In overhead systems current-carrying capacity is hardly ever the limiting factor in determining current density. However, in underground systems the reverse is sometimes true. Therefore, after the above calculations for economics and voltage drop are made, the resulting current density should be examined to determine whether it would overload the copper. If so, then the current density to be used must be recalculated with the heating of the copper as the limiting factor.

By use of this method the calculation of the proper size of copper for primary feeders is a comparatively simple process. However, in the case of primary laterals, there are other factors that must be considered. In a radial system it is usually convenient to use two or three different sizes of copper in the primary laterals beginning with the largest size directly at the feeder terminal and tapering off toward the smallest size at the greater distances from the feeder. It must be borne in mind, however, that the primary system is continually changing to meet load demands. Therefore too great use of the smaller sizes of laterals should not be permitted. The larger sizes should be extended to form at least a skeleton of trunk lines interconnecting with the trunk lines of other feeders so that the copper of the primary laterals will be sufficient to permit shifting of load from one feeder to another by cutting and splicing or to permit picking up the load of an adjacent feeder in case of emergency.

In a system in which the primary laterals are thus laid out to take care of load growth and to permit emergency operation, the size of copper in a large portion of the laterals usually bears little relation to the load carried under normal conditions, and the losses are usually so small that the economics of copper loss vs. cost of copper do not enter into the problem. The laying out of the primary laterals thus becomes a matter of judgment and careful planning for future system conditions. However, cases may be encountered where it is desired to determine the economics of current density in primary laterals. In such cases a modification of equation 1 can be used as follows:

In a primary feeder the current is the same throughout the entire length. In a primary lateral the current varies from point to point due to the distribution of load along its length. For convenience a uniform distribution of load can be assumed. With such load distribution the power loss in the copper is one-third what it would be if the current at the end toward the feeder were present throughout the entire length. Thus, if $I_L$ equals the maximum current of the primary laterals, or, in other words, the current at the end toward the feeder, we get by introducing the factor $\frac{1}{3}$ in the derivation of equation 1

$$I_L = \sqrt{\frac{3C_2}{0.0011Cf}} \qquad (2)$$

# Transformers on Upper and Lower Floors Save Copper

By T. W. Swartz

*Assistant Engineer Underground Department,*
*Northwestern Electric Company, Portland, Ore.*

STUDY of the distribution problem in the new sixteen-story office building housing the three American Power & Light organizations centered in Portland, Ore., showed that two transformer vaults centrally located with respect to the 750 kva. demand to be served would result in reducing secondary copper expense and add to the reliability of service.

The accompanying schematic diagram shows how the problem was worked out. Two transformer vaults were provided, one in the basement and the other on the sixteenth floor. The latter contains 300 kva. in lighting transformer capacity and a 225-kva. bank for three-phase power service and is fed by two three-phase, 2,400-volt lead-covered cables carried 240 ft. vertically in the building.

*In serving a large office building 2,400-volt feed was carried to a roof transformer vault to reduce total wiring cost*

All lighting and power on the fifteenth and sixteenth floors and a 100-kw. floodlighting load on the thirteenth and fifteenth floors are fed from the sixteenth floor vault. A large saving was made on the elevator feed, which consists of six 750,000-circ.mil rubber-covered cables supplying four 35-kw. motor-generator elevator sets, with provision for a fifth. The wire run was reduced from 250 ft. to 14 ft.

In the basement vault there is 900 kva. in lighting transformer capacity and 150 kva. for three-phase power. The service feed from this vault is indicated by the secondary feeder designations in the diagram. Duplicate 2,400-volt feeders from a ring feeder system serve the building as a whole. A sectionalizing switch was placed between the two building feeders in the street manhole to permit the load to be separated normally.

Two 250,000-circ.mil lead-covered cables were carried up the elevator shaft in conduit to the roof vault, without change in size to avoid fusing at points of reduced size, in compliance with the city code. At the end of each 10 ft. section of conduit was placed a pull box, in which the cable is supported by a woven copper wire strap.

In both vaults the lighting load is supplied by what amounts to a duplicate feed. The lighting transformers are banked in pairs and loaded to 150 per cent of the rating of one transformer. Normally each transformer in a bank carries 75 per cent of rated load, but in case of emergency one transformer can operate at 150 per cent of rated capacity to carry the entire load. All transformer secondary leads are carried to copper buses in the vaults to facilitate connection changes in emergencies.

Further details as to switching arrangement, buses, etc., are shown by the schematic diagram.

# Service Restoration Expedited

A detailed description of how service or trouble dispatching is organized and handled by the Metropolitan Edison Company

By J. E. Shalter

*Chief Service Dispatcher Metropolitan Edison Company, Reading, Pa.*

*Service dispatching office — Under glass cover of center cabinet are maps showing locations of transformers, feeders, arc and incandescent-lamp circuits. Below are feeder boxes, gasoline lamps and storage-battery portable spotlights used for distribution trouble. Pneumatic tube communication is afforded with the system operator's office.*

THE service dispatching department of the Metropolitan Edison Company at Reading, Pa., takes care of all troubles on the distribution system supplying 34,096 customers within a radius of 20 miles, making about 500 calls per month of an average length of 1 hour and 13 minutes. The personnel consists of one chief and four assistant service dispatchers, three linemen and three assistants, two inside service men and one street-lighting inspector. The department provides 24-hour service, with at least one dispatcher, one lineman and one assistant lineman on duty. The shifts of the linemen and assistant linemen are arranged so as to have two of each on duty between 7 and 8 a.m. and 2 and 4 p.m., in order to take care of the most important times of the day. If the dispatcher needs additional help in emergencies during the day, he may draw from any of the line gangs, of whose whereabouts he is kept constantly informed, whereas at night he calls as many men as he may require.

A lap in the shifts of the inside service men is also arranged so as to have two men on duty between 11 a.m. and 5 p.m., with "one-man service" during the remainder of the time from 7 a.m. to 9 p.m. At times when these men are not out on trouble they are employed repairing and calibrating meters in the meter department, which forms a source from which four or five extra men can be drawn in emergencies.

These men take care of service complaints involving meter trouble or blown service fuses which are maintained by the company. Cases of such trouble occurring at night are handled by one of the service linemen. Inside trouble is the only case where only one man is sent; all other troubles must be handled by at least two men. The street lamp inspector is on duty at night and is required to keep all street lights in the city and suburbs working properly. He works in conjunction with the city police department, which receives most reports of outages, and reports hourly to the service dispatcher.

During severe storms all of these men, as well as a large number of line department employees, either report for duty or call in to inquire if their services will be needed.

Four maps, which are kept constantly up to date, are used in the office for the city; similar maps are used for suburban sections, one map shows distribution lines and locations of all transformer banks, with their numbers, different colors being used to indicate if the lines are three phase or single phase, 2,300-volt, 13,200-volt or underground cables Lines and locations of city incandescent street lights appear on another map, with similar maps for arc lamps and for street railway distribution, the latter showing locations of feeder taps, breakers, crossings, etc.

The distribution file uses 4x6-in. plain salmon-colored cards for the location, type and size of line fuses, and yellow cards for transformer banks, giving data on transformer fuses, lightning arresters, etc.; space is also provided for recording the results of load checks. A blue card is used for each unit of a transformer bank to give complete data on the unit, including test results of losses, impedance, regulation and efficiency and a chronological record of locations at which it has previously been in service. All customers, with their addresses, are listed on white cards. These cards are arranged in the file in the order given above according to line numbers, bank numbers and customers on each bank. Transformer banks are numbered consecutively on each line, with the line number preceding; for instance, No. 108-3 means Bank No. 3 on Line No. 108.

Complete up-to-date information is kept on a "transmission line record" of material used on poles, size of the line wire, type construction, etc. Pole records are filed according to number, also according to location, a yellow card being used for Metropolitan Edison Company and a blue one for Reading Transit Company poles. Poles are numbered consecutively, with a distinguishing letter to designate the district if suburban distribution lines and with the line number if a transmission line pole.

Service men are provided with two Chevrolet trucks equipped with hand searchlights, switch sticks, a supply of all makes and sizes of fuses, a quantity of wire and a full set of tools required for any emergency job. One Ford truck is equipped with four portable high-powered searchlights. The inside service man uses a Chevrolet touring car which carries a complete supply of 110- and 220-volt fuses and sealing equipment, as about 40 per cent of the service switches are sealed. For emergency service, when all of the above-named equipment is in use, the service men use standard touring cars and a handbox, of which thirteen are available. Nine of these boxes, about 7x7x20 in., are used for street railway signal trouble and are equipped with five lights connected in series with suitable leads for testing and a supply of lamps, fuses, sockets, etc. For distribution trouble four boxes, 13x20x26 in., are provided, containing a supply of all types and sizes of line, transformer and secondary fuses. In the office a complete supply is also kept of all fuses and fuse holders so as to make it unnecessary to waste time going to the storeroom for such material. Nineteen additional storage battery type searchlights and sixteen two-burner gasoline lamps are always available for immediate service.

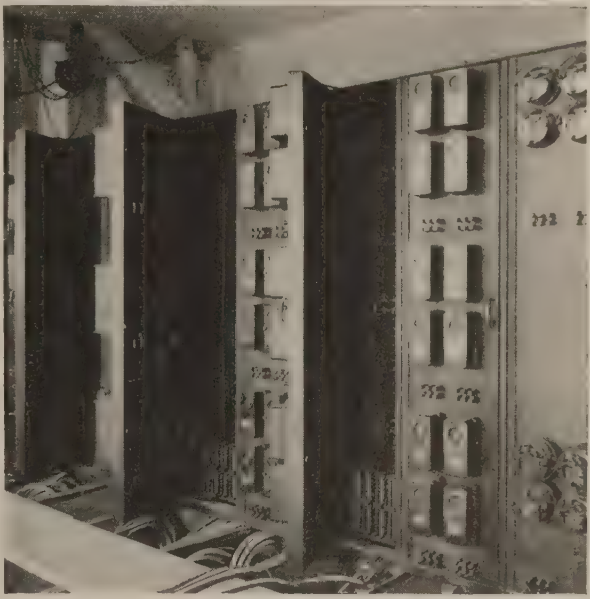
### PROCEDURE FOLLOWED

When the service dispatcher receives a large enough number of "no light" or "no power" calls to indicate that a transformer or line fuse is probably blown, he makes out a trouble ticket in duplicate, giving the name and address of the party and the nature of the trouble reported, and stamps both in the calculagraph. Referring to the distribution map, he obtains the transformer bank number. With this he can ascertain from the distribution file the exact transformer location and type and size of fuse, type, size and voltage of the transformer, and from the list of customers following he has a check on having located the proper bank. All this information, and in addition the type, size and location of line fuse, is noted on the trouble ticket and the original is then given to a service man. Upon his return to the office he notes on the trouble ticket what repairs he has made and whether they are temporary or permanent. The dispatcher again stamps both the original and the duplicate in the calculagraph, thus having a record of the exact time consumed. The original is filed in the office and the duplicate is sent to the engineering department to keep that department's records up to date as regards any changes that may have been made by the service man. In case a temporary repair was made, due to its being too large a job for the service man, the dispatcher makes out a "work order" giving all details of what remains to be done and turns it over to the general line foreman. The duplicate is held in the file as a check on uncompleted work and is given to the foreman as soon as he turns in the original properly made out.

When a report of "no light or power" is received from a customer fed from 13,200 volts, a "trouble ticket" is made as before. This is sent to the local dispatcher through a pneumatic tube connecting the two departments. The local dispatcher, if the line is energized, fills in the transformer and fuse data and returns the ticket to the service dispatcher, who checks this information and dispatches a service man, the procedure thereafter being as outlined previously. When the local dispatcher or system operator has trouble with any of the transmission lines, he makes out the "trouble ticket" and sends it to the service dispatcher, who immediately sends out four or more patrolmen in case the location of the trouble is not known. These men are told to stay clear of the lines at all times and immediately to report from the nearest telephone anything they find. The man locating the trouble is ordered to stay at that point until the repair crew arrives. The service dispatcher refers to the transmission line record file, which gives, as previously stated, complete information on material used on the various poles, and dispatches a repair crew with a sufficient amount of the proper material to make any necessary repairs.

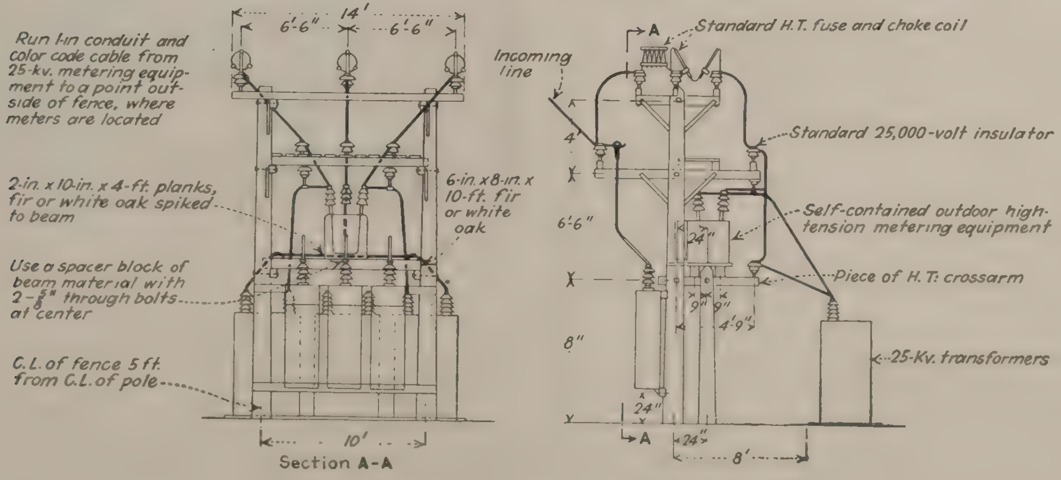
On individual "no light" calls the ticket is merely made out with the name and address and referred to the inside service man during the day and evening or to any available service lineman at night, but the disposition of the completed tickets is the same as in all cases given above.

## Hinged Panels Reduce Space Requirements



RELAY boards in the control room of the ventilating buildings of the Holland vehicular tunnel are provided with hinged panels. This construction permits full accessibility of wiring and minimizes space demands behind the boards. Fishbach & Moore, Inc., was the contractor. Service is supplied by the United Electric Light & Power Company and the Public Service Electric & Gas Company of New Jersey.

## Self-Contained 25-Kv. Metering Equipment



Run 1-in conduit and color code cable from 25-kv. metering equipment to a point outside of fence, where meters are located

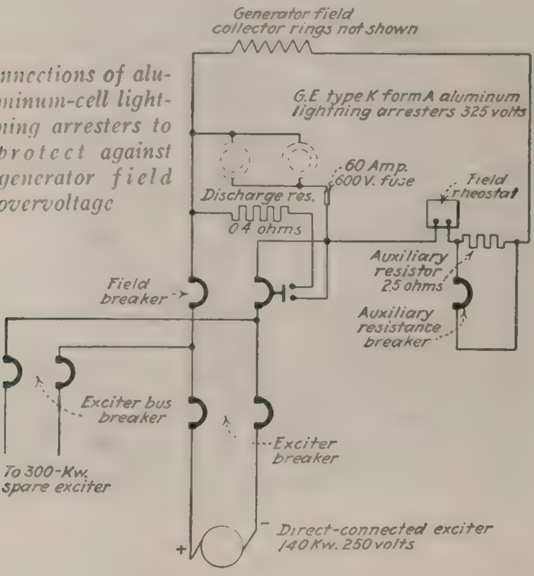
# Protecting Generator Fields Against Overvoltage

By R. B. Greenwood
*Moccasin Plant, Moccasin, Calif.*

THERE are a number of cases on record of severe trouble developing as the result of the field circuit of a large alternator becoming open-circuited. The usual cause of such an open circuit is the failure of a splice between field coils or the opening of a circuit breaker that is not provided with a discharge resistor contact. Suddenly introducing a large block of resistance into the field circuit by the opening of a circuit breaker will also result in overvoltage.



Generator field collector rings not shown
G.E. type K form A aluminum lightning arresters 325 volts

Exciter breaker
To 300-Kw. spare exciter
Direct-connected exciter 140 Kw. 250 volts
+

*Connections of aluminum-cell lightning arresters to protect against generator field overvoltage*

The increase in voltage referred to is due to self-induction. When the number of turns, amperes and area of the magnetic circuit is considered it is obvious that destructive voltages may possibly result from the decaying flux when the field current of a large machine is suddenly and completely opened. Field circuit breakers invariably are provided with extra contacts which connect a resistance of low value across the field leads somewhat in advance of the complete opening of the circuit. The energy that would appear as an arc at the breaker contacts is thus dissipated as heat. Troubles have resulted from discharge clips failing to make proper contact. These parts should be checked as part of the machine's routine monthly inspection.

Protection against excitation circuit overvoltages has been obtained in a few hydro-electric plants by the installation of aluminum cell lightning arresters. An installation of this nature was made in the Moccasin plant of the city of San Francisco a year ago and to date has proved very satisfactory. In this plant car-type aluminum cell arresters are connected across the circuit of each field of the four 20,000-kva. generators, as shown in the accompanying diagram. A 60-amp., 600-volt fuse is connected in series with each pair of arresters to protect the circuit against the possible, although remote, failure of the arresters. The two cells and the fuse are contained within a wooden box provided with hinged door and mounted on the concrete wall near the rear of each exciter breaker panel.

It will be noted from the diagram that the exciters at the Moccasin plant are direct connected. Since there is an exciter breaker and an auxiliary resistance breaker in each field circuit the opening of either breaker will result in overvoltage, and it is largely for this reason that arresters were installed. The auxiliary resistance breaker is opened by voltage relays, and relay action has occurred a few times, also exciter breakers have been opened by accident. The arresters have functioned properly during these abnormal conditions. The exciter voltage varies between the limits of 90 to 205 volts throughout the day, depending on load conditions.

Being continuously connected to circuits that are energized the greater part of each day these arresters do not require charging. As regards maintenance, the electrolyte is changed annually and the plates will be replaced as found necessary, which will probably be every three or four years.

The complete cost of each arrester installation per generator was approximately $50, which is a small sum to invest for the protection secured.

# Electric Locomotives Operated in 1 Ft. of Water

SO GREAT has been the water encountered by the contractor in driving the 7.8-mile Great Northern railway tunnel under Stevens Pass in the Cascade Mountains of Washington that it is often necessary to operate electric locomotives with 15,000 gal. of water per minute flowing through the tunnels, submerging the tracks under 6 in. to 1 ft. of water.

That the 44 six-ton locomotives used in this work are able to operate at all under such conditions seems incredible; nevertheless, comparatively little trouble has been experienced, only six armatures having been burned out in two years.

*Water is no drawback to operation of electric locomotives in tunnel work*

The locomotive shown is of the trolley and reel type. Five hundred feet of cable on a motor-driven reel is used to operate the locomotive beyond the end of the trolley where blasting would tear down the trolley. Several storage-battery locomotives are used as well.

# Opposes Contract to Regulate

Companies declare constitutional rights threatened by abolition of court appeal. Economic weakness of proposal put forth by counsel for companies

CHAIRMAN ATTWILL'S recent arguments, on behalf of the Massachusetts commission, before the legislative committee on power and light in regard to House bill 170, providing for regulation by contract, were summarized in the ELECTRICAL WORLD, March 3, page 479. Fifty-four gas and electric companies represented by Sheldon E. Wardwell, counsel for the Massachusetts Gas and Electric Association, opposed the measure, contending that it would nullify the right of court appeal, confiscate a considerable portion of accumulated assets, dry up the wells of fresh capital and stagnate development. Extracts from Mr. Wardwell's argument against the bill follow:

"During 1927 90 rate reductions by Massachusetts gas and electric companies were announced, and this year numerous others have been filed. Most of these reductions were made voluntarily. As was the case a year ago, I am not here today to attempt to justify all rates. The last few years have been a period of unparalleled business activity and electric companies have been prosperous. Possibly other electric rates should be reduced.

"In justice to the electric companies, however, it is believed that this committee will recognize that every element entering into the cost of electric service has increased in price since pre-war days. Yet in the face of this increase, out of all prices which enter into the cost of living, electric rates alone have been reduced. The electric companies have on the whole paid no excessive return to the stockholders. Most companies have neither earned nor paid an exorbitant return, nor have they charged exorbitant rates. The main reason that the impression of a large return exists is that the return is quoted in terms of an unfair level or base.

### ASPECTS OF WORCESTER CASE

"During the last year there has been a certain amount of agitation and criticism of the rates of electric companies. The department has ordered some rate reductions. Most of those ordered have been put into effect by the companies. In one case, that of the Worcester Electric Light Company, the commission ordered a cut in the lighting rate from 7 to 5 cents. The Worcester company, which was then giving the lowest lighting rate of any company in the state, sought relief from the order of the commission by proceedings in the federal court and obtained an injunction. The trial of its case is assigned to begin before a master on April 15. Three principal points appear to be involved:

"1. That in making their order of reduction the commission took as its justification the wrong rate base and refused to allow a return on the fair value of the company's property.

"2. That in estimating that a 6 per cent return is adequate, as the commission stated in that case and again in the Cambridge case recently decided, the commission assumed too low a rate of return.

"3. That in fixing a rate as low as 5 cents per kilowatt-hour the commission would force the company to serve a very large percentage of its customers at a loss.

"The commission made a flat reduction from 7 to 5 cents in the Worcester rate. The utilities believe that this flat rate method of rate making by the commission is unfortunate; that it produces inequitable results as between different classes of consumers and that establishment of a flat maximum rate at 5 cents compels the company to serve a very large percentage of its consumers at a loss and compels it to hold up rates to other consumers not only now but for the future, and that this is a very bad thing for the industry and for the community. The majority of the Worcester consumers using 15 kw.-hr. or less per month will be paying a total bill of 75 cents or less. It is less than the cost of service and produces no return to the company. It is inequitable to expect the larger consumers to make up the loss, and if the business of a community suffers a period of stagnation the power and commercial lighting customers will show a decrease in demand and the company will be unable to make up its loss.

"It is well recognized throughout the industry and by the regulating commissions elsewhere that the method of rate reduction adopted in the Worcester and other cases produces inequitable results between the consumers and that it is an antiquated and illogical method of rate making. I admit that it has been the custom of the commission for many years to adjust on a flat rate basis, but this was because the commission claimed that it was governed by a provision in our laws which allowed it to deal only with the maximum rate. Last year the commission received power to deal with all rates. I at least had hoped that in future the commission would adopt a practice which exists elsewhere and that instead of dealing with the maximum rate only, and forcing a company to sell a large part of its product at a loss, the commission would adopt the practice of determining a rate reduction by ordering a company to reduce its revenue a certain number of dollars, leaving the company to put in rates which were equitable to the different classes of consumers. I say without hesitation that if the commission adopted this practice there would be a greater probability that its rate reduction orders would be considered acceptable by the utilities, which in this respect believe that they are foresighted and looking for the good of the community as well as for the good of the industry.

### SIX PER CENT TOO LOW

"The second difference between the utilities and the commission is that the board says a 6 per cent return is adequate. 'Very attractive,' it says in the recent Cambridge decision.

"The utilities believe that a 6 per cent return is inadequate, that it will fail to attract the investors' money to the industry. For many years hardly any commission decisions have suggested that a public utility was entitled to less than 7 per cent, and a great many of them have allowed 8 per cent or even higher. If Massachusetts decides that 6 per cent is all a utility is entitled to earn, Massachusetts will cease to attract capital, and capital is essential for growth, and growth is essential if we wish to continue rate reductions, as it is only through mass production that this can be made possible.

### THE APPEAL TO THE COURTS

"Now we come to the more spectacular, though perhaps not more important, part of the controversy between the commission and the utility which produces this attempt by the commission to forestall an adverse decision by the Supreme Court of the United States, by forcing the utilities to agree to surrender all constitutional rights, and hereafter to be governed by whatever form of regulation the commission may choose to enforce.

"The decisions of the Supreme Court of the United States indicate, I believe, and evidently the commission also believes or it would not be so disturbed, that, in general, companies are entitled to a reasonable return on the fair value of their property and that the fair value cannot be determined without consideration of the reproduction cost of the property less depreciation.

"Whether or not this statement is correct will probably soon be decided by the Supreme Court of the United States in the O'Fallon case, which has now been appealed to the Supreme Court and which will soon be on the docket. Now this principle of determining value in the ordinary case by a finding of reproduction value less depreciation is no new thing. It was advocated in 1898 (a period of low prices) by William Jennings Bryan on behalf of the public. To all intents and purposes the principle has been accepted since by practically every commission in this country. The matter becomes important now and the dissent arises because there has been an increase in the general price level above the pre-war level. In other words, the index number is perhaps 40 per cent higher, so that so far as a utility has property which was installed prior to 1917 the utility would on the cost of reproduction theory have a valuation of 30 to 60 per cent in excess of cost of that part of its property. On property installed since 1919, which is the greater part of the existing investment of the utilities today, there has been no material change in the price level, and if conditions and price levels remain as they are and the growth of the utility continues, so far as the gas and electric industry is concerned this whole controversy will practically disappear in four or five years, because with the discarding of old property and the continued growth in new property investment the proportion of installation at pre-war prices is diminishing very fast.

"I will hazard an estimate that most electric companies in Massachusetts would under the reproduction theory receive credit for a rate base today of only between 10 and 30 per cent in excess of actual investment, depending on the amount of new property installed in the last ten years.

"In the opinion of some of the leading economists in the United States the reason for the so-called increases in value economically justifies reproduction cost as a rate base.

"You are familiar with the fact that prices have gone up since before the war, prices of labor and of commodities generally, and the underlying reason is the change in the purchasing power of the dollar. The laborer receives more wages, the apartment house owner receives higher rents; it does not make any difference whether the laborer was born before 1917 or whether the apartment was built before 1917. Is there any justification for saying that the investor in a public utility should have different treatment from an investor in any other form of industry? 'Prudent investment' is a very attractive phrase, but 'prudent investment' without equating to the diminished purchasing power of the dollar merely means that you are depriving the investor of some 40 per cent of his dollar, and the economist can show you that this is so.

"Men like Prof. Irving Fisher, Dr. Arthur Twining Hadley, Professor Cabot* of the Harvard Business School and other leading economists in the country believe that, in so far as property should govern rates, value should be determined on the basis of the reproduction theory, and Professor Cabot points out the dangers to the public of determination on any other theory, which can be phrased in a word, perhaps, by saying that if you pass the commission's bill, and a period of declining prices comes, the people of Massachusetts will be very regretful of this proposed contract. In other words, the commission would now attempt to transfer the risk of the enterpriser to the rate-paying public. I might just as well say tax-paying public, for the personnel are one and the same.

"The utilities believe that they are not only legally but economically justified in their position, and that to recede from this position would be submitting to confiscation of a very material part of the investment of the stockholder. The commission in its report to the Legislature refers to the greed and gluttony of the man who would introduce this principle into Massachusetts regulation, and I assume that the fellow conspirators of these 'gluttons' are the Justices of the Supreme Court of the United States who have apparently approved the reproduction doctrine, some of the leading economists of the United States who advocate it, and the utility commissioners of most other states of the Union who have adopted it.

"It is only recently that the suggestion was made that there is a different rule of rate making in Massachusetts than elsewhere; that suggestion has no foundation in law or in fact.

### PENALTY OF NON-ACCEPTANCE

"Now, passing from the crime for which the utilities are to be punished, the crime of challenging the commission's decision in the federal courts, let us turn to the penalty. If the utility does not enter into a contract by which it submits to any kind of regulation which the commission may hand out municipal competition shall be encouraged, a competition which would be suicidal to both the competing municipality and the utility. The utility shall also be deprived of the power of eminent domain. It got along without the power of eminent domain for a great many years; this power was given it in order to cheapen the cost of service, and this has resulted. It shall be deprived of the power to issue further securities for plant expansion, which of course dries up the utility, impairs service, results in its eventual demise and entire loss to the investor. The bill is intended to prevent a utility from claiming constitutional rights of any description by forcing it at the point of a pistol to agree to give up its constitutional rights. It is

---

**Professor Cabot's argument will shortly appear in the* ELECTRICAL WORLD.—EDITOR.

an attempt to nullify the Constitution of the United States by indirection, and as such it is an unconstitutional attempt.

"The commission's bill confiscates part of the investment and reduces the return. After certifying that its issue price was in the public interest, should the commission take this attitude toward the stockholders? I think any one would agree that the commission never should have made an order to put out stock at a level which it was unwilling to accept as a rate base, and may I suggest that, if this bill is passed, the commissioners in their capacity of regulating issues of securities under the blue sky law ought to investigate themselves in their capacity of regulating the issue price of securities, like the Lord Chancellor in 'Iolanthe,' who was compelled to find himself in contempt of court because he was in love with his ward in chancery.

"In the case of the Fall River Gas Works vs. Gas and Electric Light Comm., 214 Mass. 529, the court said:

> As between the public and the corporation the earnings belong to the corporation.

"The commission has for years recognized the surplus when it ordered issue of stock at a premium.

"The theory now is that if a company paid 7 per cent average and earned anything more it was a robber. Is this so? Was 7 per cent compensatory in the early days, when risks were believed large; was it compensatory during the panic of 1893 and the following years; was it compensatory during the depression in the early part of this century; was it compensatory during the Roosevelt panic in 1907, and thereafter; was it compensatory from 1914 to 1923, a period during a large part of which some of the best industrials in the country were paying 8 per cent and higher for borrowed money; was it compensatory during 1926, when some of the finest public utility securities in the country were selling on an earning ratio basis of over 7 per cent?

"The surplus of the companies is not to be named in cents per kilowatt-hour. It was accumulated in small fractions of a cent per kilowatt-hour, and in every moment of the company's history there has been a commission with power to control rates.

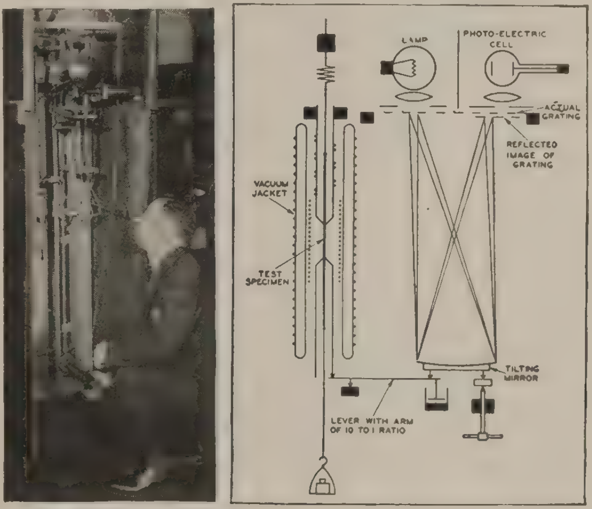
### In Times of Depression

"But even if it is assumed that the assurance of a return sufficient to maintain the market value of stock at par is practical, and if beyond this complete good faith is presupposed and a practical guarantee is maintained, what happens? In times of economic stress and depreciated security values the rate of return will have to be increased to conform to the security market. In order to provide for this return, rates will have to be increased and the financial burden will thus be transferred directly and wholly from the investor to the rate payer, and in this connection it should be remembered that in times of economic stress unemployment is at its peak and the earning power of the average consumer is restricted. Just at the time when in the interest of the larger group of citizens conditions should be maintained with the greatest degree of stability, it will be necessary under the mandate of this bill to increase the rates and thrust the burdens upon incomes which have already been depleted.

"The history of the public utility industry has never presented a condition parallel to this. Rates have always been increased with great reluctance and the investors have never claimed their pound of flesh, but through the exercise of economy and forbearance have postponed, and in most cases avoided, rate increases in times of trouble. They are still willing to do as they have always done heretofore, and the vicious character of this bill is nowhere more apparent than it is in the case of the unnatural and uneconomic condition which it would impose upon the investor and the rate payer alike when adversity threatens."

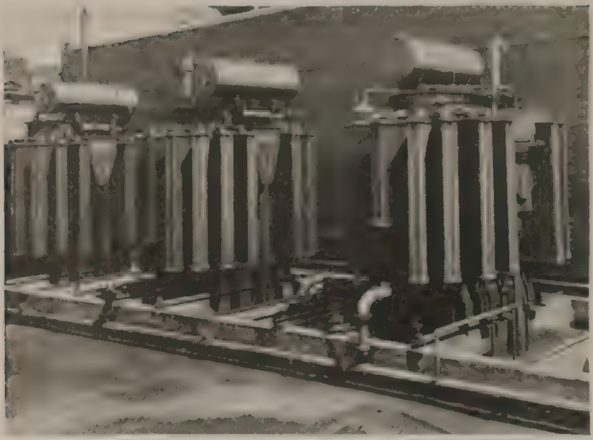
## Measuring Infinitesimal Elongation Electrically

EQUIPMENT to measure changes in length of the order of a billionth of an inch has recently been devised by P. P. Cioffi of the Bell Telephone Laboratories. The need for so refined an instrument arose in studies of magnetic materials. It was designed to measure changes of length in a piece of wire about 4 in. long. One end of the 4-in. section is fixed in position and to the other end a clamp is attached which connects to the short arm of a lever. The long arm of this lever tips a concave mirror as the wire changes its length. Light from an incandescent lamp, after passing through a suitable lens, falls on the mirror at a small angle from the perpendicular and is reflected back to a position somewhat offset from the lamp where a photo-electric cell is mounted. Between the light source and the mirror is a grating with alternate opaque and transparent lines, each $\frac{1}{2}$ mm. thick. The image of this grating falls on the mirror and is reflected back to an extension of the same grating in front of the photo-electric cell. When the images of the transparent lines are reflected back to another group of transparent lines full light will fall on the cell. When, on the other hand, they fall on the opaque lines no light will be transmitted. Only a very small movement of the mirror is required to cause this change from full light to no light. The photo-electric cell gives off a current proportional to the light falling on it, and this current is indicated by a sensitive galvanometer. The galvanometer indication thus serves to divide the width of one bar of the grating into a large number of smaller divisions.



*Arrangement and schematic plan of accurate measuring device*

## Exposed Buses Eliminated in Outdoor Substation



OUTDOOR equipment is reduced to a minimum by the Brooklyn Edison Company in this bank of 27,000/4,600, three-phase, 10,000-kva. transformer units. Three-conductor, underground, lead-covered cables for high- and low-tension connections run to oil-filled potheads on the sides of the transformers. Grounding switches are provided.

## Costs for White-Way Lighting

ACCURATE operating costs for one year's operation of a white-way lighting system were kept by the serving utility to use as a basis for contracting for operation and maintenance on future installations. The system consists of about a mile of two-light standards using modern high-intensity lamps. Like many other cities, lighting installations of this character are paid for by the property owners by establishing an assessment district. Property owners also are permitted to contract for lighting and maintenance for a period of five years.

It is evident that the matter of operating costs is quite important to the central station, since any error in calculating these costs must be carried over a period of years before there is any chance of rectifying matters. Accordingly, the accompanying costs are presented in the hope that they may be of value to other central stations that are developing this type of load:

| | |
|---|---|
| 1. Cost of lamp replacements per light unit per year, labor and cartage only | $0.90 |
| 2. Average cost of lamp replacements per lamp per year, labor and cartage only | 0.30 |
| 3. Cost of glassware replacements per light unit per year, labor and cartage only | 0.05 |
| 4. Average cost of cleaning glassware per light unit per year (material, labor and cartage, six cleanings per year) | 1.46 |
| 5. Average cost of cleaning glassware per light unit per cleaning | 0.24 |
| 6. Average cost of patrolling and inspecting the installation per light unit per year (material labor and cartage) | 0.38 |
| 7. Average cost of maintenance of posts, cut-outs and post base transformers per light unit per year (material, labor and cartage) | 1.07 |
| 8. Average number of hours system was operated per light unit per year, lamp hours (one-third burn all night) | 3,334 |
| 9. Average number of lamp renewals per light unit per year (one-third burn all night) | 2.96 |
| 10. Distribution and transformer losses expressed as percentage of rated wattage of lamps | 25 |

In studying this table it should be understood that the term "light unit" refers to the lamp and inclosing glassware. There are two such light units per post. It should be noted that in items 1, 2 and 3 the cost of lamps and glassware has purposely been omitted, since this factor varies with the lamp and glassware used, and may be accurately determined for any installation.

A very important point brought out by the cost study is the fact that the wattage assessable to each lamp as determined from the kilowatt-hours used by the system is 25 per cent greater than the rating of the lamps. This indicates that line losses and losses in the constant current transformers and series post transformers in this installation are somewhat higher than is generally assumed. This is an item of great importance where the service is sold on a predetermined value instead of on a metered basis.

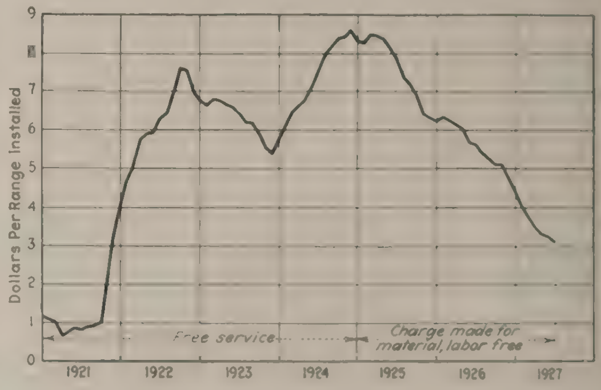
## Range-Servicing Costs Mount Under Free Maintenance

By D. F. McCurrach
*Rate Engineer Northwestern Electric Company, Portland, Ore.*

SINCE the latter part of 1921 the power companies in Portland, Ore., have engaged actively in range sales and have built a large range load. Up to 1925 no charge whatsoever was made for servicing ranges, both labor and material being supplied free indefinitely. The effect of this practice was not fully appreciated until the cost of maintenance per range mounted to a serious figure, when both companies decided upon a change of policy to relieve them of the serious burden.

Under the new policy a range user is charged for all material used in maintenance, but still receives the labor free. A new customer has free maintenance for one year, the materials being furnished by the range manufacturer and the labor by the utility; after that a charge is made for material only.

The accompanying curve shows the average cost of range maintenance of the Northwestern Electric Company over the period covered by the different range-servicing policies. The salutary effect of the present policy as compared to the old is too obvious for reference.



*Effect of range-servicing policies upon average maintenance cost per range*

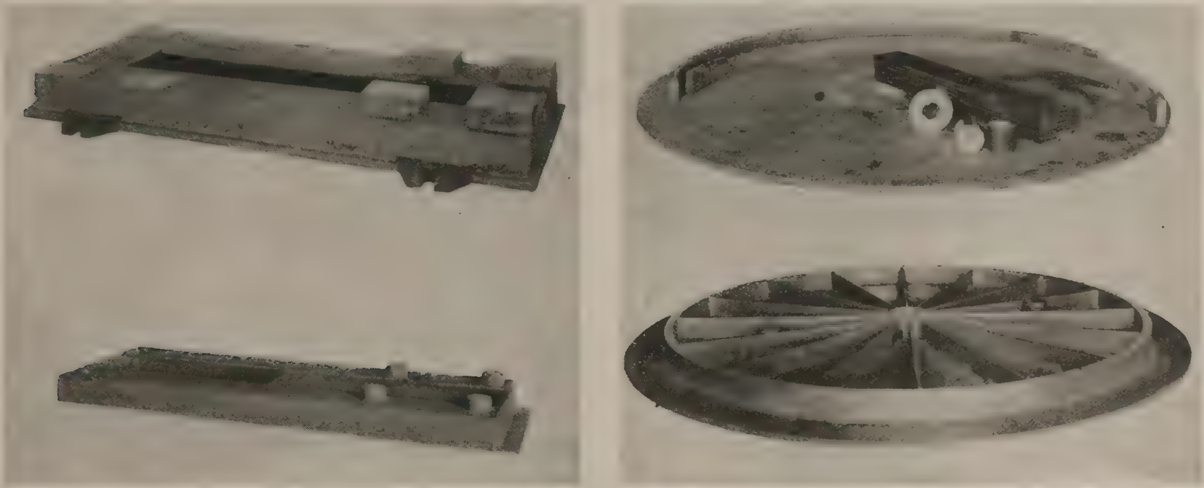
The cost of maintenance per cumulative average range installed is obtained as follows: The moving annual total range maintenance as of any particular month is divided by a figure which represents the cumulative number of ranges installed as of a year preceding the month investigated, plus one-half of the ranges installed in the current year. This method of showing the average maintenance cost has the effect each month of indicating in a general way the trend of these costs, as each calculation covers a year's operation.

# Arc Welding for Machinery

### An analysis of the underlying factors governing the use of arc welding, with some examples of cost comparison with cast iron

By A. F. Davis
*Vice-President Lincoln Electric Company*

LIKE many other industrial processes that have been sponsored by the electrical industry, arc welding has spread into industry as a whole so that its significance to the electrical industry is small as compared with its significance to industry at large. Use of the electric arc for welding purposes was once an interesting novelty; today many people believe that electric arc welding is destined to bring about sweeping changes in American industry. The prophets of the welding fraternity are numerous and frequently make extravagant claims. Examination of the underlying factors that govern the use of welding may be helpful.



*Comparison of costs between welded and cast-iron parts*

| Motor-Generator Set Base | |
|---|---|
| Cast-iron base weight | 560 lb. |
| Cost | $31.70 |
| Welded steel equivalent weight | 233 lb. |
| Cost | $7.45 |

| Machinery Turntable Base | |
|---|---|
| Weight of rough casting | 4,200 lb. |
| Cost | $336 |
| Weight of welded-steel equivalent | 1,740 lb. |
| Cost | $105 |

It is believed by many that the use of welded steel construction in place of castings is a serious threat to the foundry. It is claimed and adequately proved that a number of pieces of welded steel construction have been built that are the equivalent of castings, and cost figures are given to show that the welded steel costs only 25 to 50 per cent as much as the castings.

Does this mean that the foundries of the country are doomed? Engineers and executives who have had wide experience with welded steel construction say that the foundry is not doomed. J. H. Francis, vice-president and general manager of the Kilby Manufacturing Company, Cleveland, gives his view of the situation as follows: "We own and operate a gray-iron foundry. We also build a large amount of welded-steel construction. A considerable amount of the welded-steel construction is done on pieces which we formerly made in the foundry. The type of construction we use depends largely upon the job. Our responsibility to our customers compels us to manufacture our product as well as we can by the most economical process. Welded-steel construction has been built in our plant for thirteen years and we are doing more of it all the time. As yet, however, we see no indication that it would be a good thing for us to dispose of our foundry."

Advocates of welded-steel construction in place of castings have advanced the following as a sound basis for their claim that, where welded steel can be used, it is far less expensive than cast iron: Hot-rolled steel and gray-iron castings are both made from pig iron which costs about $20 per ton. Gray-iron castings cost, on the average, $120 per ton. The additional $100 per ton covers all the charges for molding, pouring and other foundry expense. The same ton of pig iron which cost $20 could have been made into hot-rolled steel for an additional $20 per ton, making a total cost of $40 a ton for hot-rolled steel. It costs five times as much to get a ton of pig iron into the form of a casting as it does to get it into the form of hot-rolled plates, shapes, bars, etc. The next step is to get the hot-rolled stock cut to size and welded into the equivalent of a casting. It is claimed that this cost on simple machinery bases and frames will in most cases not exceed $40 per ton. Thus the welded steel equivalent of the casting may cost $80 per ton, against $120 per ton for the casting.

*This cylinder bracket cost less than a casting exclusive of the wood pattern cost*

| | |
|---|---|
| Weight | 74 lb. |
| Material cost | $5.60 |
| Labor cost | 5.44 |
| Equivalent rough casting cost | 11.84 |
| Wood pattern | 30.00 |

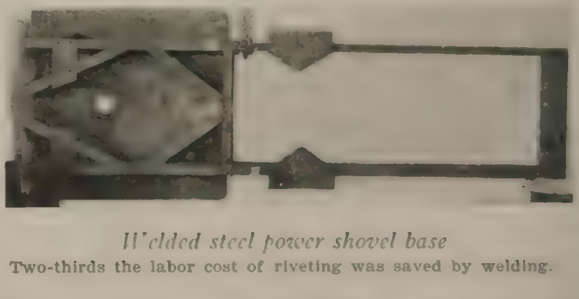
Owing to the superior physical properties of steel as compared with cast iron, it is claimed, usually less than one-half the weight of steel is required as compared with cast iron. The ratio of cost is therefore calculated to be, cast iron, $120; welded steel, $40.

It seems obvious from the preceding discussion that the importance of welded-steel construction and its effect on the foundry as well as industry in general is directly dependent on the percentage of castings that can be replaced with welded steel economically. On this point the testimony of I. T. Kahn, president of the Consolidated Iron & Steel Company of Cleveland, is interesting. The company operates the Republic Structural Iron Company, which, in addition to ordinary steel fabrication, makes welded-steel pieces in place of castings. The Consolidated Iron & Steel Company also owns and operates the Taylor & Boggis Foundry of Cleveland. Mr. Kahn sums up the situation as follows: "Operating, as we do, steel-welding equipment and a gray-iron foundry, we from time to time have to advise our customers the preferable construction for a given article and occasionally to suggest a change. It would seem that the idea of cost would be the determining factor, but this is not entirely so, and it is also true that a cost which may be favorable to welded steel, on a production of ten pieces per day, may be favorable to castings on a production of the same piece of 1,000 per day, or vice-versa. Appearance is important to American machinery manufacturers and users. Which of the two methods gives the better appearance? Generally the saving through the use of welded steel results from a reduction in weight, yet in many cases bulk or weight is essential in a certain member of the machine, which raises the question as to whether weight is essential to the design. Another question, which, however, is one of the components of cost, is the price of patterns for castings and the assembly jigs for welding. When these conditions are answered advantageously as to welded products, we recommend the change. As to the ultimate effect upon our foundry, we have no fear. Castings will not be discontinued and we believe anything that reduces the cost of machinery opens up new fields of consumption at each new level of reduced costs. Thus with a loss of such members as are changed to welded steel, the foundries will be compensated by increased production of the remaining unchanged members."

Present opinion among those who are in a position to judge the situation appears to warrant the belief that increasing use of welded-steel construction may necessitate some changes in the organization of the foundry industry. The foundry will hold the business which it can handle more efficiently than the welded steel department. But if the pieces of simple shape and in general the jobs which furnish the tonnage jobs of the foundry are to be built in welded steel, it means that the foundry will have to be organized to produce this class of work very efficiently. The tonnage jobs in the foundry are frequently looked on as the salvation of the foundry management in keeping the cost per pound of making castings down. Take these jobs out of the foundry and the cost system has to be overhauled and more efficient methods employed.

The machinery builder who operates his own foundry is in much the same position as the jobbing foundry. If he takes the tonnage jobs out of his foundry, he may find that it is more economical to buy the small castings from a foundry which is meeting the new situation with more efficient methods of producing small castings and can actually beat his own cost on the outside on this class of work. Several machinery builders who use welded-steel construction and also operate a foundry already face this situation.

The idea of welding in place of riveting does not carry with it the implication of radical changes in iron and steel business such as may occur should welded-steel construction replace gray-iron castings on a large scale. No one appears to be very much excited about the question of whether steel shall be riveted together or welded together. The novelty of welding has worn off and the matter has become, to a considerable extent, a question of which method costs the more. There are of course, a



*Welded steel power shovel base*

Two-thirds the labor cost of riveting was saved by welding.

number of cases in which the judgment of the engineering profession is against the use of welding because it is relatively new and a great deal remains to be learned about it. High-pressure steam boilers, etc., can be welded but probably will not be welded until more is known about the process. However, this is but a matter of a short time, for we are making considerable progress in our knowledge of the process.

The grounds on which the advocates of welding base their claims to recognition on work which may be either riveted or welded are that there may be a saving of both material and labor. A material saving is claimed and in many cases proved on tanks, steel pipe and similar jobs, due to the fact that the welded joint may be as strong in tension as the members joined. The strength of the joint determines the thickness of material required on work of this kind. The riveted joint, on the other hand, is always weaker than the sections joined, so that an excess of material is required. The labor cost of joining steel pieces by welding is claimed to be less than the labor cost of riveting. The fact that the welding "gang" is one man and the riveting "gang" three or four men gives weight to the argument for welding. In shop welding there is general agreement that the work per day per man is far greater with welding than with riveting.

*This guide link of welded steel costs considerably less than a casting*

| | |
|---|---|
| Weight | 90 lb. |
| Material cost | $5.08 |
| Labor cost | 0.85 |
| Equivalent rough casting cost | 18.00 |
| Wood pattern | 60.00 |

To summarize the whole situation relative to the use of welding, it may be said that in so far as welding may be used to fabricate jobs which were formerly made using castings or riveted steel, and produce an equivalent job at less cost, welding will be used. The conditions in the machinery building field which have been brought about by the application of arc welding are not unusual. The development of high-speed steel necessitated a much greater change in the design of machine tool equipment to meet the new high-speed and high-power conditions than may be expected in the case of introduction of welded-steel construction in place of castings.

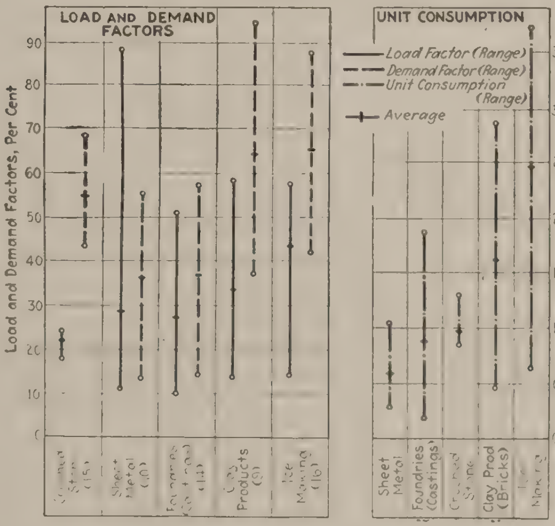
# Characteristics of Industrial Loads

### Performance of individual plants departs widely from averages. Useful data must be based on individual processes

EVERY now and then some one believes that considerable laborious investigation can be avoided in determining this or that factor if certain average electrical characteristics are obtained for different industries. For example, many commercial and engineering decisions could be made if the average load factor, demand factor or energy consumption per connected load for different industries were applied to individual plants in those industries. The question has been raised whether meter size might not be based on a certain percentage of the connected load.

While the general comment is often heard that every case must be considered by itself, it applies particularly to industrial characteristics. To show this fact 50 industrial plants representing five major classes of business were investigated to ascertain whether any average figures can be obtained for specific industries that mean anything.

Sixteen ice-making plants, fourteen foundries, ten sheet-metal factories, nine brick plants and five stone crushers were studied. The results are plotted herewith by group and relativity. Since they do not include small installations and apply to industries in one locality, the individual results should approach the averages if they will under any condition.



*Comparisons of average yearly load factors, demand factors and unit energy consumptions for different industries with departures from averages*

A glance at the charts representing the separate industries indicates how widely the individual factors vary from the average, the departure being greater with some industries than with others. The master chart comparing load and demand factors and unit consumption for these five industries appears on this page and shows the same things a little more clearly than do the charts for each industry.

For example, load factor* (yearly) variation is least for crushing stone and greatest for sheet-metal working, departures from average for foundries, brick plants and ice making being as much as +87, —70: +75, —60: +35, —65 per cent of average respectively.

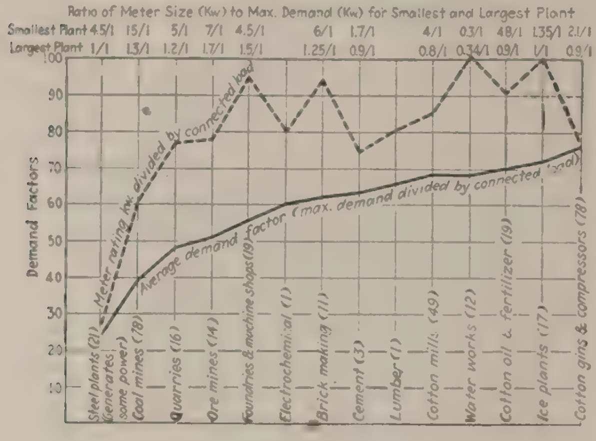
Likewise, demand factor* (yearly) variations are least for crushing stone and greatest for the other industries considered. Similar remarks can be made regarding kilowatt-hour consumption per connected kilowatt per year.

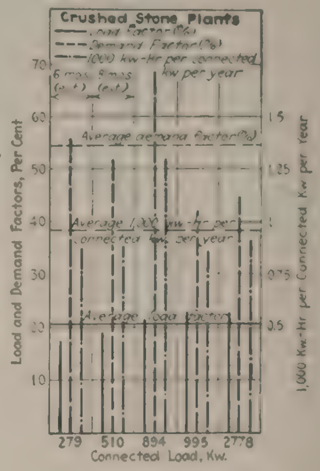
If averages mean anything when the departures are so great as those observed, it can be said that ice making has the highest load factor, demand factor and energy consumption per connected kilowatt. Of the remaining industries, brickmaking, sheet-metal plants, foundries and stone crushing rank in descending order for load factor. Brickmaking, stone crushing, foundries and sheet-metal plants rank in the order named for reduction in demand factor and energy consumption per kilowatt of connected load.

The general conclusion is that average figures that mean anything cannot be derived even for specific industries.

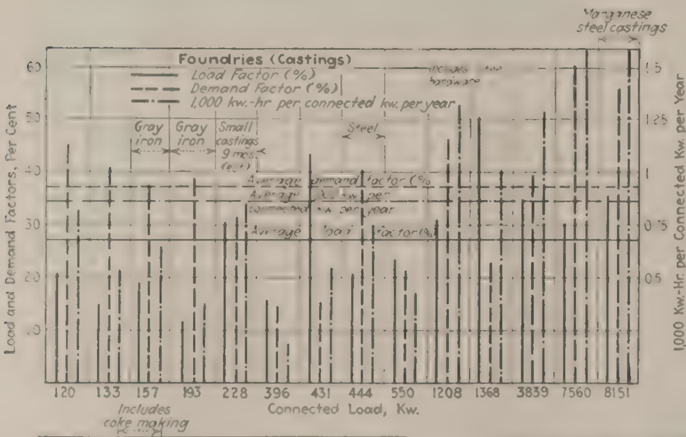
---

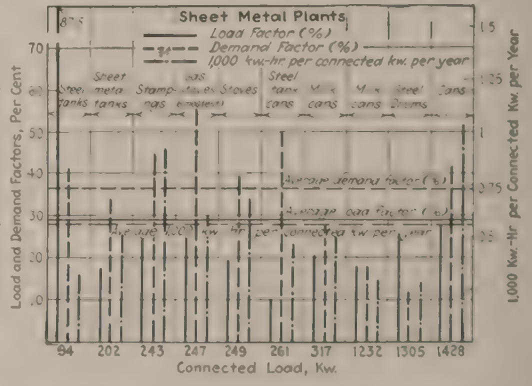
*Load factor and demand factor are loosely used frequently. They are used here with their standard meaning. For example, load factor is the ratio of average power to maximum power. Demand factor is the ratio of maximum demand to connected load.*

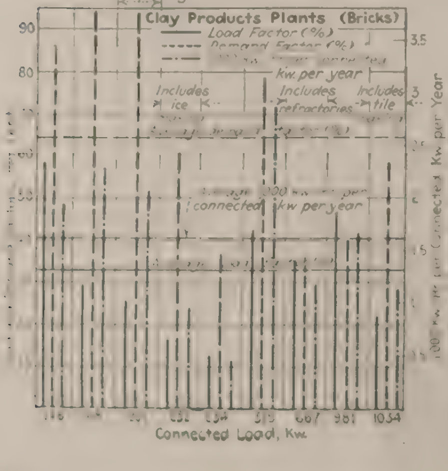


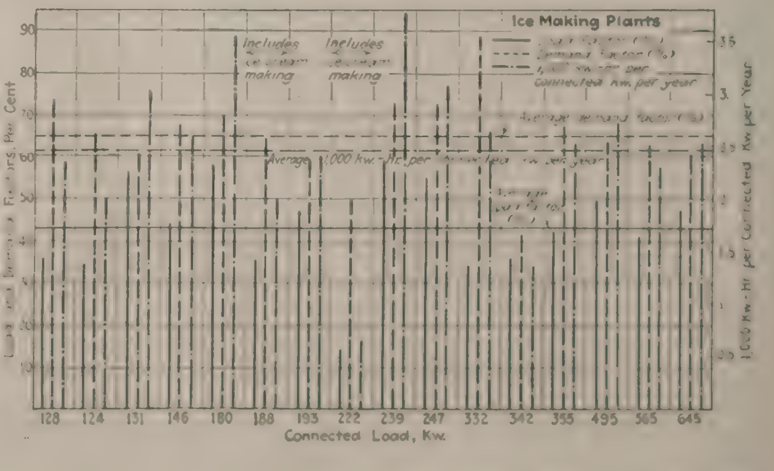


*Comparisons of yearly load factor, demand factor, unit energy consumption and relations of meter size to connected load and demand factor for different installations engaged in similar occupations*









## Unusual Street Lights for Los Angeles

AN ARTISTIC street lighting system has been designed for Wilshire Boulevard, Los Angeles, by the General Electric Company. The lighting units, or lanterns, are larger than previous designs for this type of service. They are, in general, rectangular in shape, approximately 7 ft. high and are mounted on poles to bring the light center 22 ft. above the street. Each lantern contains two incandescent lamps, one 2,500 cp. and the other 600 cp.

A double wiring circuit will make it possible to operate either lamp separately or both together. It is intended to use the brighter lamps from darkness until midnight and the smaller lamps from midnight until daylight, when traffic on the street will be so light as not to require as much illumination. Approximately 400 of the new lights have been installed 120 ft. apart on either side of the street. The poles are of bronze-sprayed cast iron and the lanterns of cast bronze. In accordance with the general popular vogue in southern California of using the Spanish renaissance design for much of its street architecture, this style has been followed in the design of the lanterns and standards.

## Utility Finds Opportunities for Economies in Many Departments

CONVINCED that continuous thinking in terms of economy and adopting a policy of undeviating vigilance will bring results, a public utility supplying a city and suburban community in the East has applied its theories in practice.

The end of the construction, or expansion, period in the territory of this company permitted the reduction in number of workmen in the construction department from 105 to 15. This eliminated a large labor item, and the maintenance work was scheduled and arranged so that a minimum number of workers are now required for this class of activity.

Passenger automobiles formerly assigned to individuals for their exclusive use have been numbered and are now used as taxis—that is, are operated when needed, by any employee privileged to car use. This resulted in a reduction in the number of vehicles needed from twenty to fifteen, with a consequent curtailment of overhead and operating expenses. Standardization of motor vehicles, both passenger and commercial, eliminated a great multiplicity of spare tire, parts and tool requirements and permitted shop storage space curtailments. The value of eliminating assigned cars was believed to be largely psychological, offering a means of inducing employees to think of their activities in terms of economy.

Combination of the functions of the underground forces of the electric and gas divisions made one supervisory organization serve for both. Working crews were consolidated so that any truck can service either class.

Record-department complexity was reduced. Where formerly seven sources of information and records on meters and customers, accounts were maintained, there will be two files for this purpose. A saving in floor space of about 10,000 sq.ft. was realized and a contemplated expenditure for expansion which would have involved $7,000 to $8,000 was avoided.

A recent survey of consumers' homes indicated that about 12 per cent of the fixture outlets were not provided with lamps. A successful campaign for the sale, at an attractive price, of packages containing six lamps resulted in placing more than one additional lamp per customer in the hands of consumers in this territory.

Sales efforts added refrigerators to the lines and the recommendations of satisfied users have led to a market out of proportion to the direct sales efforts. Similar comments can be made regarding other appliances.

Changing from arc equipment to incandescent street lamps to reduce maintainance charges and replacements has converted the net results from a loss per installation per year to a reasonable profit.

Interconnection with adjacent electric light and power systems is considered to have reduced the value, as essential operating units, of the individual power station comprising this company's generating capacity. As the necessity of the individual unit for service continuity maintenance is reduced and some of them are not required for stand-by service in the event of breakdowns, fewer small stations must be maintained. Interconnection has, in addition to reducing the capital investment required for generating purposes, resulted in better service and higher reliability. The number of operators was found to be greater than necessary, after the completion of the interconnection program, and the services of 30 men were dispensed with.

This company has found that there are opportunities in nearly every department for making the invested dollar work harder, longer and more effectively.

# Letters from Our Readers

### *Value of Purchased Power*

*To the Editor of* ELECTRICAL WORLD:

The attention of ELECTRICAL WORLD readers should be called to a miscalculation by Edgar J. Kates in the Feb. 14 issue of *Power,* where he discusses "Guessing Fixed Charges for a Proposed Power Plant."

He assumes an industrial establishment using 17,000 kw.-hr. per month with a maximum demand of 100 kw. and a Diesel engine operating cost of 1.1 cents per kw.-hr. This gives an operating cost of $187 per month. Then he proceeds to say that purchased power costs 2.28 cents per kilowatt-hour, or $476 per month. My arithmetic makes this only $387.60 per month. This is a serious error. Mr. Kates assumes an investment of $15,000 necessary to produce the above results.

If this industrial plant put the $15,000 in a safe investment at 6 per cent it would make $900 per year, or, better still, if put back into its own business probably three or four times this amount. Furthermore, ten years is a long time and this industrial plant will probably have lower power rates before that, or at least it will want to have $15,000 ready to buy a better oil engine; $900 plus $1,500 is $2,400, equaling the amount of the assumed saving. Also, the plant would probably not have maintenance and other troubles to worry about.

It looks as if Mr. Kates has made about a $20,000 error.

L. O. BUCKNER.

York, Pa.

[The rate upon which the calculations of Mr. Kates were based was 2.8 cents; the figure of 2.28 was a typographical error, according to the editor of *Power.*—EDITOR.]

# Digest of Electrical Literature

## *Generation, Control, Switching and Protection*

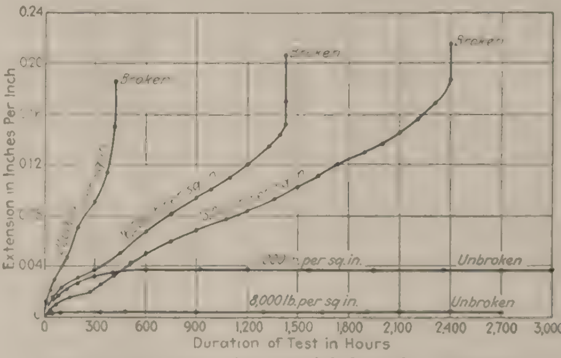
*Transformer Protection.*—V. Wiarda and E. Wilm.—An overwhelming majority of transformer faults are accompanied and preceded by abnormal heating of the oil. Over-current protection cannot function until the fault has developed to such magnitude as to cause a material increase of the normally absorbed current. A gas relay, on the other hand, fails to respond until the abnormal heating is high enough to dissociate oil or to cause an arc. A well-designed temperature relay of high thermal sensitiveness is therefore considered by the authors as superior to either of these two. Two such relays of recent design are described. Both of them utilize the bending of a bimetallic strip. The disadvantage of the slowly moving strip, combined with the uncertainty of making a reliable contact, has been avoided by causing the strip to release a lever, subjected to heavy spring pressure, thereby obtaining a positive snap-action switch. The strip, adjusting screw, spring switch and resetting lever are mounted in a 1-in. insulating tube, which can be screwed oil-tight into cover or tank of a transformer. Adjustment is provided for a range of 50 to 120 deg. C., within an accuracy of plus or minus ½ deg. This relay was adopted as standard equipment on all power transformers of the Berlin municipal power system.—*Elektrotechnische Zeitschrift,* Jan. 19, 1928.

## *Transmission, Substations and Distribution*

*Heavy Traction Substations.*—H. B. Poynder.—A practical consideration of some of the problems encountered in the design of automatic rotary convertor equipment which still await satisfactory solution. The author has considered the circuit breakers, ventilation, thermal relaying and vertical versus horizontal design for rotary convertors. The advantages of high-speed circuit breakers are stated as including the prevention of serious lightning trouble on the track equipment. It is the contention of the author that breakdowns which occur during thunderstorms are in almost all cases caused by surges set up by lightning strokes in the vicinity of the track which do not actually strike the equipment. The initial discharge amounts to only a relatively small number of coulombs, is practically harmless so long as it takes place over the surface of the insulators and does not pierce them, and this can be insured by proper design of the insulators. The damage results from the great heat generated by the power arc which follows, and the high-speed breaker, by limiting the time during which the power arc persists, prevents any damage to the insulators in the great majority of cases. The author is strongly in favor of the development of an overhung vertical machine with a central bearing and a steadying thrust bearing below, the slip-rings being between the two bearings. This is advocated as producing a compact design with magnet ring resting on the substation floor and the slip-rings in the basement. The accumulation of conducting vapor would be impossible, there being in the suggested design a free upward path for all conducting vapors.—*Electrical Review* (*England*), Feb. 10, 1928.

## *Hydro-Electric Development and Steam Equipment*

*What is the Limiting Temperature in Central-Station Operation?*—V. T. Malcolm.—As a result of investigation the author states that at each temperature of a metal under test there is a stress which if exceeded will cause fracture, though equipment may give satisfactory service operating at this temperature with loads greater than the critical stress for many years. The best conclusions indicate that the design of equipment must be based upon the strength of metals at operating temperatures over long periods of time and that other properties, such as thermal expansion, thermal conductivity, chemical stability, resistance to wear and abrasion, etc., must receive greater attention than in present engineering practice. These latter factors will probably govern actual design, but the first and basic requisite is that of physical strength and the proposed temperature. Charts for various alloys considered by the author to be safe for operation at 1,000 deg. F., and which are also satisfactory for such service as requires wear resistance, chemical stability and coefficient of expansion, are given. The physical properties of metal suitable for high temperature service have been reviewed in connection with creep values, chemical stability, thermal expansion and wear and abrasion factors.—*Mechanical Engineering,* February 1928.



*Creep tests on cast chrome-nickel steel, at constant temperature (1,000 deg. F.) and load*

## *Units, Measurements and Instruments*

*Absolute Measurement of Capacitance by Maxwell's Method.*—Harvey L. Curtis and Charles Moon.—The absolute measurement of capacitance by Maxwell's method is based on the assumption that certain conditions are fulfilled by the experimental apparatus. While there are at least seven of these conditions, the most important is that the galvanometer correctly integrates the current. When large capacitances are measured, a galvanometer is required in which the current through the coil does not affect the magnetism of the permanent magnet. By placing the coil in a symmetrical position with respect to the magnet this condition can be fulfilled in most galvanometers. This adjustment is, however, greatly simplified by a proper design of the galvanometers. The method used by the present investigators requires that a condenser shall be charged and discharged at a known rate. This is accomplished by platinum contacts dipping in mercury cups which have been placed on the prongs of a tuning fork driven by an electron tube. This permits the Maxwell bridge to be balanced with the same ease and accuracy as a Wheatstone bridge. It is necessary to determine the frequency of the fork at the time of measurement. The possibility of introducing systematic errors has been guarded against by employing two independent bridges in which the factors have been varied as much as possible.—No. 564 *Scientific Papers of the Bureau of Standards.*

## *Illumination*

*An Investigation of Electric Lighting in the Engineering Industries.*—J. L. H. Cooper.—The modern trend toward standardization in industry has resulted in attaining a degree of workshop efficiency not hitherto available and it is now realized that the prosperity of all industrial establishments depends to a large extent on the adoption of standardized systems for lighting in workshops, and in contrast to the earlier lighting systems much more attention is now given to illumination and the arrangement of lighting units. The author has reviewed the general attitude of employers in Great Britain in regard to lighting, the activities in connection with more progressive lighting policies. The average hours of artificial lighting are tabulated in connection with significant factors of wall conditions and window conditions, and work requirements, the servicing and maintenance of lamps and equipment, the types of lamps employed, glare factors, types of buildings, lighting of machine tools, tabulated values for tool point intensities and general intensity values have been given. The author states that it is not generally appreciated that the cost of lighting in the average workshop represents a very small percentage of other charges when one considers the payroll and capital charges. In general, the cost of good lighting, both in large and small workshops does not exceed 0.86 per cent of the wages bill. The cost, therefore, of good lighting cannot be considered as a burden on industry, but on the contrary is economically sound and efficient.—*Journal of Good Lighting (England)*, January, 1928.

## Motors and Control

*Accurate Control of Rolling Speeds.*—The electrically driven 10-in. merchant bar mill recently installed in an Ohio plant has unusual provisions for close regulation of rolling speeds. As a result, less frequent roll changes are necessary. It is unnecessary to maintain close supervision of roll diameters, as is required with constant-speed drives, because the speed of the stand may be increased to compensate for alteration of the roll diameter. Roll changes are unnecessary for sizes from $\frac{7}{32}$ in. to $\frac{5}{8}$ in. in round bars or equivalent sections in squares and flats, according to this article. Each mill motor has an individual magnetic control panel so that any stand can be started or stopped. When each of the stands is driven at the proper speed the bar passing through it is kept under tension but not stretched or looped. Because of the close centers, speed is controlled by a synchronous tie between the motors, which in reality takes the place of interlocking gears. This control is obtained by individual balance-type vibrating speed regulators which not only maintain a synchronous tie among the four motors but also maintain a correct speed set for each motor within close limits. This speed-regulating equipment may be taken out of service by the operation of a transfer switch and the motor placed under hand control.—*Iron Age*, Feb. 2, 1928.

*Electrically Driven Woodworking Machinery.*—Various aspects of the direct electric drive, with particular reference to high-speed equipment made possible by the application of high-frequency alternating-current motors, have been considered in this discussion. Tabulated recommendations of countershaft speeds and motor sizes and ratings for use in connection with the more common types of woodworking machinery have been included. The use of portable electric tools in certain jobs has also received consideration, with particular reference to the speeds found desirable for standardized specifications.—*Electrical Review (England)*, Feb. 3, 1928.

## Electrophysics, Electrochemistry and Batteries

*Electric Puncture of Two Dielectrics in Series.*—E. Marx.—If two insulating media of greatly different electric strength are placed in series, and are subjected to a puncture test, it will be found that the failure of the weaker material reduces materially the strength of the other, stronger, material. The partial breakdown acts like a sharp point, concentrating the electric field and causing a premature failure of the other insulator. The tests were made first between electrodes immersed in distilled water, with a sheet of Cellon half way between the electrodes. It was found that the polarity is considerably influenced by direct-current tests. Similar characteristics were found with porcelain or glass in oil. For example, a certain oil-porcelain-oil combination failed at 77 kv., while the porcelain piece alone did not puncture until 136 kv. Since such combinations of dielectrics are commonly used in oil switches, transformers and other oil-immersed high-voltage apparatus this phenomenon should be of considerable value to designers. — *Elektrotechnische Zeitschrift*, Jan. 12, 1928.

## Traction

*The Post Office Railway*—A discussion of the underground electric railway for the conveyance of letter and parcel mails between the principal post offices and railway stations in London. This system has recently been opened for traffic and a description of the electrical layout and equipment is included in this article. The total length of the railway as at present constructed is 6½ miles. Operation of the trains is entirely independent of any accompanying motorman and control is obtained through switch cabins at each station. The rolling stock consists of steel cars which are made up into trains of two or three units. Each car is capable of carrying a load of 1,120 lb. The electrical equipment is relatively simple and consists principally of two 22-hp., 440-volt direct-current series motors connected in parallel. A resistance in series with each motor and a set of electrically operated braking equipment and reverse gear are mounted on each car. The motors are energized in the usual way from the conductor rail, which is divided into sections, each section being controlled either by an automatic track circuit on the sections between the stations or by levers working under track circuit control in the station areas. These levers are concentrated in the various switch cabins. The train is started on a falling track gradient under a pressure of 440 volts and attains a maximum speed of 35 m.p.h. When a station is approached and a rising gradient is encountered the conductor rail is dead and the train is brought to rest by the automatic operation of the brakes. After a short interval the conductor rail in this section is energized at 440 volts and remains energized at that voltage for a predetermined time, which is sufficiently long to give the train a good start. At the end of this period the voltage is reduced to 150 and the train runs into the station under these conditions. Here it either enters a dead berth section and is brought to rest by the brakes alongside the appropriate platform or it passes on to a through section if it is not to stop at the station.—*Electrician (England)*, Feb. 10, 1928.

## Miscellaneous

*Physical and Optical Societies' Exhibition.*—Electrical instruments were a feature of the eighteenth annual exhibition of the physical and optical societies recently held in London. Several types of unusual interest were included. An improved oscillograph outfit suitable for potentials up to 75,000 volts includes two electromagnetic vibrators and one electrostatic vibrator, which may be used to obtain voltage records at very high pressures through variation of equipment characteristics. This device requires but one camera and one source of light to which an abnormal voltage is applied for a fraction of a second during the time of exposure. The intense light thus obtained passes through an optical system, which insures that a separate beam is focussed on each vibrating mirror. The reflected beams pass through a cylindrical lens, thereby reducing the images to bright spots of film, which is moved in a vertical plane at right angles to the plane of the vibrating beams. Another exhibit was a low-tension Schering bridge of improved design, which provides a simple and accurate means of measuring the power factor and dielectric constant of insulating materials at audio-frequency. Provision is said to have been made for measuring power factors from 0.001 to 0.5 with test capacities varying from 60 to 1,000 micro-microfarads. The electrodes and leads are screened so that samples may be tested at a controlled temperature and humidity. The bridge is direct reading and easy to operate. A heat-loss gage, which may be carried in the hand and used at the desired point, has been devised for measuring the heat loss from a surface of boiler settings and other hot bodies. The surface of a capsule is exposed to the heat emanating from the surface under test, either by making direct contact with the surface or by holding the instrument at a distance, when the radiant heat is measured. The instrument's heat receiving surface is surrounded by a guard ring.— *Engineer (England)*, Jan. 12, 1928.

# Book Reviews

## *English for Engineers*

By S. A. Harbarger, assistant professor of English Ohio State University. New York: McGraw-Hill Book Company, Inc. Second edition. 300 pages. Price, $2.

"English for engineers, or 'engineering English' as it is popularly called, should mean the presentation of ideas from the engineer's angle, the interpretation of ideas as he sees them with his interest, his training, his ambition and his vision." With this definition, the author, in a manner at once succinct and comprehensive, gives many practical hints concerning the way in which the engineer should approach writing of every description—sales matter, business letters, letters of inquiry and instructions, technical explanations, abstracts, summaries, reports, book reviews, editorials and articles for engineering societies and publications. A chapter is also included on "English for Non-Technical Uses." College students and young engineers should find in the book an incentive to care and pains whenever they put pen to paper. Practice is nine-tenths of style; but great engineering writers are few, and it is doubtless as unreasonable to expect an accomplished engineer to be also a brilliant author as it would be to expect a master of composition to excel as a technician. Every engineer, however, can shun the errors of the illiterate and the jargon of the marketplace. Professor Harbarger's effort is rightly and well directed.

## *Anleitung zur Entwicklung Elektrischer Starkstromschaltungen*

By Dr.-Ing. Georg I. Meyer. Berlin: Julius Springer. 159 pages, 167 illustrations.

The usefulness of this book lies in its affording a basis for building up switching schemes to fit various conditions as they may confront the engineer. It does not offer ready-made solutions, and it is confined to power circuits. As might be expected, the major portion is devoted to polyphase control, with its diversity of possible connections, relays and protective devices. Liberal use is made of schematic diagrams. Bold lines and separate figures to focus attention on one item at a time contribute to the clarity of treatment, which is essentially descriptive, dealing with methods, rather than devices.

## *Der Transformator im Betrieb*

By Dr. Milan Vidmar. Berlin: Julius Springer. 310 pages, 126 illustrations.

The author's avowed object is to reconcile the viewpoints of operating engineer and designer by discussing the economics and the functioning of transformer installations under unusual as well as under normal conditions. Thus, he points out that under pressure of price competition the effect of technical progress is inevitably and progressively to decrease the efficiency. The inclusion of analyses of the functioning of protective devices—e.g., fuses, circuit breakers, lightning arresters and choke coils—in their bearing on thermal and mechanical phenomena within the transformer is commendable. The treatise sums up transformer performance in a readable and authoritative way, somewhat off the beaten path and avoiding excessive use of mathematical language.

## *Wissenschaftliche Abhandlungen der Physikalisch-Technischen Reichsanstalt*

Berlin: Julius Springer. Vol. X, Parts 1 and 2, 363 pages; Vol. XI, Part 1, 336 pages.

The general quality of these reprints of contributions from the Reichsanstalt to various scientific and technical journals is too well known to call for comment. They are not confined to any one branch of physics. Space unfortunately does not permit even a catalog of titles of those relating to electricity or using interesting electrical methods. Photometric and optical studies appear in considerable number; others deal with high-frequency or high-intensity electrical and magnetic measurements, including mention of an oscillograph serviceable up to 50,000 cycles p.s., low-temperature conductivity of metals and crystals and platinum resistance thermometric calibrations, measurement of low thermal conductivities, color methods for temperatures of small coils, a condenser method for measuring bearing lubrication and a unit for Roentgen ray dosage. There is a lengthy report on the calibration of mercury standards of the ohm.

## *Landeselektrizitätswerke*

By S. Schönberg and E. Glunk. Munich and Berlin: R. Oldenbourg. 398 pages, 144 illustrations.

This comprehensive treatise by former associates of the late Oskar Miller deals with superpower systems in general, although the illustrations are largely drawn from the great Bayernwerk. The authors take up in considerable detail various stages in the development of a large regional undertaking, giving due attention to economic as well as engineering considerations. The units are necessarily the local systems, which must be co-ordinated into a single entity. Among the topics discussed are the estimation of the probable demand, the obtaining of data by means of suitable questionnaires, the predetermination of the future lighting, industrial and transportation loads, determination of the sites and magnitudes of hydro-electric and steam stations to be constructed, the securing of an economic balance between the two sources of energy, and finally the working out of the major engineering features. The book contains a profusion of tables, charts and diagrams.

## *Die elektrischen Einrichtungen für den Eigenbedarf grosser Kraftwerke*

By Friedrich Litze. Berlin: Julius Springer. 160 pages, 89 illustrations.

Power plants, both steam and hydraulic, have grown to such magnitudes and in modern practice make use of so many automatic features that a great deal of electrical apparatus is necessary to the plants' own functioning, as distinguished from the main equipment for the generation and control of the outgoing energy. The author states that no unified treatment of this auxiliary equipment has heretofore been published. The book undertakes to make up the deficiency in a descriptive way. While useful as a summary of modern practice, its value would be greatly enhanced by the inclusion of quantitative information.

## *Die Grundlagen der Hochfrequenztechnik*

Br. Dr.-Ing. F. Ollendorff. Berlin: Julius Springer. 639 pages, 379 illustrations, three insert charts.

The author has successfully put into a single volume enough of the underlying theory of high-frequency engineering to serve as an adequate introduction to practice, if combined with a reasonable amount of suitable laboratory work, or if the reader is already familiar with the devices and fundamental circuits. The book was developed for a course in a German technical school of recognized standing. That will suggest the scope and grade of difficulty. The treatment is necessarily mathematical, though not obtrusively so, and the physical significance of the conclusions is pointed out. In general, it follows established lines: the first third devoted to the characteristics of static and dynamic fields and of the parts constituting the usual high-frequency circuit, the next part to circuit characteristics, forced and free oscillations, coupled circuits and related topics, and the final quarter to electromagnetic radiations. To the teacher or advanced student, especially in the field of communication engineering, it should prove useful for both the text and for the copious bibliography. Even so, the latter is not exhaustive, at least in so far as American titles are concerned.

# Books Received

*Hockspannungs freileitungen.* By Dr.-Ing. K. Draeger. Berlin: Julius Springer. 40 pages, illustrated.

*Die Gleichstrommachine.* By Dr.-Ing. e. h. J. L. la Cour. Berlin: Julius Springer. 714 pages, illustrated. Price, 30 marks.

*Radio Engineering Principles.* New second edition. By H. Lauer and H. L. Brown. New York: McGraw-Hill Book Company, 301 pages, illustrated. Price, $3.50.

## Senators Chatter, Chatter as Words Flow

### And Muscle Shoals Debate Goes on Forever—House in a Snarl on the Same Subject—Trade Commission Questionnaire—Boulder Dam "Facts"

By Paul Wooton

*Washington Correspondent of* Electrical World

DESPITE all that has been said in Congress in the past ten years about Muscle Shoals, that subject continues to stimulate protracted debate. A vote on the Norris resolution has been expected in the Senate for more than a week. As this is written, there are indications that the debate may continue for another week. It is very apparent, however, that the Norris resolution, modified by the Harrison amendment, stands a good chance of passage. In the Lower House, Muscle Shoals is in a worse snarl than ever, with the prospects against any legislation.

The Harrison amendment puts the government in the fertilizer business on an experimental basis only. While there is objection to even a small commercial production, it comes apparently from a minority. On the other hand, there is some objection from those who want to see the government become a large producer of commercial fertilizers. The majority, however, seems to think the Harrison amendment does everything for fertilizer that reasonably can be expected. The strength of the amendment lies in the fact that it removes the undesirable feature of government operation from the disposition of the power output. Under it the power must be distributed under state regulation, without discrimination among states and municipalities. Moreover, it prevents municipalities from securing power under conditions that would permit discrimination against the users of power who make their purchases through ordinary commercial channels.

The Federal Trade Commission is making its final arrangements for its hearings in the investigation of the electric and gas industries. It is stated at the offices of the commission that the utilities are co-operating to make the investigation a thoroughly efficient one. So as to obtain certain fundamental data which will aid in the conduct of the hearings, it is understood that the commission is about to send out a carefully prepared questionnaire to the industry. All the subpœnas now have been issued to take care of the initial hearings.

Instead of the private conference at first planned, preliminary hearings were held by the commission on Thursday morning of this week to examine certain officers and representatives of the National Electric Light Association and the American Gas Association. Testimony was to be taken with a view to identifying and putting in the record certain documents of the two associations relating to their organization and personnel. No announcement was made as to when other public hearings in the investigation will begin.

### Boulder Dam "Facts"

A detailed examination of the Swing-Johnson Boulder Dam bill, with suggested changes, is made by the Secretary of the Interior, Hubert Work, in a letter to Senator Phipps, chairman of the committee on irrigation and reclamation. It concludes:

> To sum the matter up, it is my opinion that the entire $125,000,000 proposed to be authorized to be appropriated from the Treasury for this project should be reimbursed, with interest. The information available to the department seems conclusive that the entire expenditure can be paid out of power and other receipts without imposing any undue burden on any feature of the project or those to be benefited thereby. Apparently, the only effect of any donation of a part of such principal or interest would be to increase the suggested contributions to the States of Arizona and Nevada. The plan set out in Section 16 for the construction of a so-called retainer dam for flood control with foundations sufficient to permit the later construction of a dam 550 ft. in height, I do not regard as feasible. In my judgment, the sum mentioned would not be sufficient to construct a dam sufficient to afford flood protection of material value.

The eleven members of the California delegation in the House of Representatives have issued and signed a "statement of facts" regarding the Boulder Dam project. It is as follows:

> 1. There is a serious and ever-increasing flood menace existing along the lower reaches of the Colorado River, both in Arizona and California, threatening the destruction of lower basin communities, the largest and most important being the fertile and productive Imperial Valley, with its 65,000 inhabitants, all below sea level.
>
> 2. A high dam at Boulder Canyon will hold back the floodwaters of the Colorado River and prevent a recurrence of the disasters of the past. This remedy has been worked out by the government engineers after thorough, exhaustive investigations and studies and has been favorably recommended to Congress by the Secretary of the Interior. Eminent engineers outside of the Interior Department have concurred in and approved the works, plans and cost estimates of the Reclamation Service engineers.
>
> 3. As an incident to this development sufficient hydro-electric power can be generated at the dam to repay the government all money advanced in the construction of the project, together with interest, well within a period of 50 years. Secretary Work in his report on the project estimates that the repayment can be made in 25 years.
>
> 4. Under the provisions of the pending bill, before a dollar of federal money can be appropriated or expended the local interests to be benefited must put up with the Secretary of the Interior valid and binding contracts, agreeing to take water and power at the rates to be fixed by the Secretary, which in the aggregate will guarantee the return to the United States government of the entire cost of the project, estimated by government engineers at $104,000,000, together with 4 per cent interest. Through the taxing powers possessed by the interested municipalities, irrigation and water districts, more than $4,000,000,000 worth of property will be placed back of these contracts.
>
> 5. An unfortunate international complication exists, due to the fact that the entire water supply for 65,000 American citizens in the Imperial Valley, after being diverted from the Colorado River in the United States, flows for approximately 60 miles through Mexico, where the water is subject to diversion and use. It is necessary for the protection of American water rights in all the basin states against the initiation of new rights by water users in Mexico, by an enlarged beneficial use there, that the All-American Canal be authorized to take the place of the present canal.
>
> 6. The magnitude of the project, the fact that the Colorado River is an international as well as interstate navigable stream, the urgent necessity for flood-control works beyond the means of local communities to build, the necessity for an impartial agency to make an equitable distribution of the benefits of the project to meet the legitimate demands of the interested states for water and power, all make the federal government the logical agency to construct this project.
>
> 7. The Swing-Johnson bill now pending before Congress embodies the matured plan of the government engineers.

### Tennessee Valley Report

In connection with the exhaustive survey being made of the Tennessee Valley the Chief of Engineers has submitted to Congress the final report on the Tennessee, Clinch and Powell Rivers and a progress report on the remaining portions of the study. The cost of the Cove Creek dam is estimated at $37,540,000. If it is built, it should be tied in with the Clinton, Melton Hill, and Kingston dams, the report says, which will cost an additional $24,900,000. When property damages are added, the entire project would cost $86,016,000. To develop the maximum power resources of the river, the report continues, nine dams should be built between Knoxville and Colbert Shoals. Dam No. 3 at Muscle Shoals being one. All this would cost a billion dollars.

## Conowingo Goes on Lines

*Power from Two of the Seven Hydro-Electric Generating Units Which Will Form the Initial Installation Is Transmitted to Philadelphia*

ONE minute after midnight on Thursday morning, March 1, power was transmitted to Philadelphia from Conowingo over the 65 miles of wire that already connect the great hydro-electric plant on the Susquehanna River, just across the Maryland boundary, with the system of the Philadelphia Electric Company. The energy thus received was put to use to supply its fraction of the demand. At 12:10 a.m. the recorder showed that 30,000 kw. was coming into Philadelphia from Conowingo. Simultaneously there was a sharp dropping off in the production of two of the company's main steam stations, the Delaware, in northeastern Philadelphia, and Chester station, at Chester, Pa. Operations of the generators at these plants were gradually reduced as the Conowingo turbines came into service.

There was no formal ceremony. Roger Taylor, superintendent of the Conowingo plant, directed the operation, and the flowing of the energy into the Philadelphia system was recorded in the load dispatcher's office at the headquarters of the Philadelphia Electric Company, at Tenth and Chestnut Streets. William H. Taylor, president of the Philadelphia Electric Company, issued a statement, in part as follows:

"The great Conowingo hydro-electric project of the Philadelphia Electric Company is virtually completed, three months ahead of schedule. Thus is inaugurated an engineering project of major importance in the electrical industry, a project that was completed in record time—a hydro-electric project which is the second in importance in the United States and one which will be of the greatest value to the Philadelphia district."

Work on the Conowingo plant was started March 8, 1926. It is expected that its initial installation of seven 54,000-hp. waterwheels will provide about 1,150,000 kw.-hr. of electricity annually from water power. When the transmission system is completed the power will be sent to Philadelphia over two 220,000-volt, three-phase lines. The total cost of the project will be around $52,000,000.

Stone & Webster constructed the plant at Conowingo, subletting part of the work to the Arundel Corporation of Baltimore. The hydraulic machinery now in place was manufactured by the Allis-Chalmers Manufacturing Company (see ELECTRICAL WORLD for March 3, page 475) and the generating units by the General Electric Company. These two firms will each furnish four of the generators and the waterwheels respectively, and three are to be supplied by the Westinghouse Electric & Manufacturing Company and the I. P. Morris Company respectively.

Full-page advertisements announcing the operation of the plant were printed in Philadelphia and New York newspapers by the Philadelphia Electric Company, the General Electric Company and Stone & Webster.

## Excitement Over Radio Legislation at Washington

Geographic equalization of radio zones without regard to great centers of population, the principle embodied in the Watson amendment to the 1927 law, has aroused great opposition in territories threatened with the loss of much of their "air" power, and prophecies are made that passage of such a bill will kill the broadcasting industry. The Radio Corporation of America, the American Telephone & Telegraph Company, Commissioner O. H. Caldwell of the Eastern district and others have come in for attacks from Senator Dill of Washington, Representative Davis of Tennessee and other congressional critics. The House was to consider legislation on Thursday. Last year's provisions expire on March 15, and unless new legislation is enacted or the term of the commissioners, two of whom have not yet been confirmed, is extended, chaos will return.

## Cleveland Electric to Have 59 More Miles of 132-Kv. Line

Announcement comes from the Cleveland Electric Illuminating Company that it will on April 1 begin the construction of a 132-kv. steel-tower transmission line, 59 miles in length, to supply additional electric power in northeastern Ohio. Within the past two years the company has rehabilitated various properties acquired in Lake, Geauga and Ashtabula Counties and has made many improvements and extensions, including 125 miles of 33-kv. lines connecting with Lake Shore and Avon stations. It recently began construction of a second 28-mile 132-kv. line connecting Avon station with the Clinton Road substation, which distributes power to the westerly portion of the Greater Cleveland area. This line will be finished about Aug. 1, at the same time that a new unit will go into operation at Avon station increasing the company's total generating capacity to more than 400,000 kw.

The new northeastern Ohio line will connect with the present 132-kv. system south of Cleveland and will follow a route across Lake County to a substation to be erected in Saybrook Township. There it will be connected with the present 33-kv. system. The line will consist of approximately 450 steel towers, supporting six copper wires strung in spans averaging 700 ft. The right-of-way will be about 100 ft. wide. With its completion the company will have 137 miles of 132-kv. transmission.

The new transmission project brings the company's 1928 budget for improvements and extensions up to $11,600,000. The new line will take several months to complete and will call for an investment of approximately $1,800,000.

## Truck Users Relate Experiences at Conference

An unusually good program was carried out at an electric truck conference in New York City, March 6, 7 and 8, held under the auspices of National Electric Light Association committees and in conjunction with the eighth annual electric truck exhibit in the New York Edison-United Companies building. Talks by users of electric truck fleets were the feature of the conference. The speakers were Matthew J. Gory, United Dressed Beef Company; George Ford, American Railway Express Company; F. P. McDaniels, Western Electric Company; Joseph Husson, Electo Company (Lord & Taylor and McCreery & Company, department stores); Charles S. Morris, Metropolitan Fireproof Warehouse Corporation; H. A. Currie, New York Central Railroad; Charles F. Wark, Pilgrim Steam Laundry, and Henry Fallerius, Bloomingdale Brothers (department store).

Utility representatives from New York, Newark, Boston, Cleveland, Chicago, Indianapolis and Pittsburgh outlined their electric truck sales programs. J. C. Boyers, Ward Motor Vehicle Company, and C. B. Cook, Industrial Truck Manufacturing Company, presented addresses from the manufacturer's angle. At a session of the truck-operating committee of the Metropolitan Section, N.E.L.A., reports of experience in the maintenance and servicing of trucks in New York, Baltimore, Chicago, Detroit and New Jersey were presented.

## New York Assembly Rejects Smith's Power Bills

The New York State Assembly last Monday, after a sharp debate, rejected, by a vote of 85 to 60 motions to bring both Governor Smith's water-power measures out of committee. One of the Governor's measures would create a state Power Authority to bring to the next Legislature a comprehensive plan for the development by the state of its hydro-electric resources. The other bill would submit the question of power development to the voters of the state this fall through a referendum. The Republican leaders now are planning to rush through their own water-power proposal, providing for a commission to investigate and report back to the 1929 Legislature. Governor Smith intends to veto the measure.

## "Inverted Speech" by Telephone Demonstrated

Before the New York Electrical Society on Wednesday evening of this week, Sergius P. Grace, general commercial engineer of the Bell Telephone Laboratories, demonstrated a process for "inverting" or "scrambling" words or sentences spoken over the telephone so that they are incomprehensible to any "listener in" and then reconverting them to their ordinary sound for the intended recipient. This is accomplished by the manipulation of sound frequencies at the transmitting end and their retranslation at the receiving end. Mr. Grace worked the device also in the reverse way, enunciating meaningless or imaginary words which the loud speaker used gave forth as proper ones. Possibilities of a commercial use for this process, where secrecy is desired, suggest themselves, but these have apparently not yet been worked out. Any intention to apply the method, which can, of course, be used with music as well as words, to radio transmission to enforce the purchase of patent "unscramblers" is emphatically denied by telephone officials.

## Quebec Authorizes Beauharnois Power Project

The private bills committee of the Quebec Legislature has placed the seal of approval on a bill whereby the Beauharnois Light, Heat & Power Company is authorized to build a power canal between Lake St. Francis and Lake St. Louis, developing 500,000 hp., half of which may be exported to the Province of Ontario on conditions fixed by the provincial government. A feature of the vote on the bill was that all the ministers of the government voted for it, a fact which in itself meant the success of the measure, though it was not a government bill. Premier Taschereau had previously pronounced himself in favor of the project as being one for the general benefit of the province, and particularly beneficial to the district of Montreal, which would have 500,000 hp. developed at its very doors. The federal government must also give its sanction. Doubt exists whether this sanction will be given until the courts decide the question of federal and provincial jurisdiction of water powers developed on navigable waterways.

When the engineers who investigated the St. Lawrence scheme submitted their report, they favored a route on the north side for the waterway in the district in question, although also commending the southern route where the proposed Beauharnois canal is to be located. With the interests behind this concern the names of prominent financiers like Frank P. Jones and E. R. Wood are associated. They are understood to have offered to build the canal and present it free for navigation as part of the St. Lawrence waterway if they receive compensation in the form of the power rights incidentally developed. Opponents of the bill contend that it means drying up the St. Lawrence River between Lake St. Francis and Lake St. Louis and thereby putting an end to existing power plants on the St. Lawrence, including those of the Canadian Light, Heat & Power Company and the Cedars Rapids development of the Montreal Light, Heat & Power Company. The first-named company has a development of 30,000 hp. at St. Timothée, having used the old Beauharnois canal under lease.

## Voltage Up to 3,600,000

*New Record Set in the Production of Artificial Lightning at Pittsfield Is Reported by F. W. Peek at St. Louis Regional Meeting of A.I.E.E.*

ARTIFICIAL lightning of 3,600,000 volts, the highest ever obtained and about seventeen times greater than that of any transmission line in this country, has been produced in the high-voltage engineering laboratory of the General Electric Company at Pittsfield, Mass. F. W. Peek, Jr., in charge of this work, announced the achievement March 7 in speaking before the regional convention of the American Institute of Electrical Engineers in St. Louis. The new generator is unique in operation. The electricity is gradually stored in artificial clouds just as electricity is stored in real thunder clouds, Mr. Peek said, and is then discharged in a blinding flash.

*A 3,600,000-volt artificial flash*

"Lightning sparks produced by these voltages, lasting but one ten-millionth of a second, can be seen as a blinding flash. However, as light travels about 100 ft. in that time, the phenomenon is all over when a person standing but 100 ft. away sees it or when the light reach him, Mr. Peek explained.

The Pittsfield laboratory has pioneered in the development of power transmission and high voltages since it supervised the construction of the first 15,000-volt line in 1891. Seven years ago this laboratory was first to announce 1,000,000 volts, four years later 2,000,000 volts was announced, and now come voltages almost twice as great. Although these voltages frequently have a duration of less than a millionth of a second, their rate of rise and fall or wave shape has been accurately measured by the cathode-ray oscillograph developed by the general engineering laboratory of the General Electric Company at Schenectady.

"The object of the study is to secure scientific information on the nature of electricity and to obtain further engineering information on the protection of life and property against lightning, to build transmission lines, transformers and other electrical apparatus to resist lightning voltages," Mr. Peek said.

From direct voltages of 3,000,000 voltages of more than 5,000,000 of very short duration were observed by reflection from the open end of a line in the experiments, Mr. Peek said. Mr. Peek and his associates have been experimenting with these voltages for many months, and he laid emphasis on the fact that his success was in a large measure due to the assistance of his associates.

A report of the St. Louis meeting of the Institute will be printed in next week's ELECTRICAL WORLD.

## Seattle Lighting Department Records Progress

In its report for 1927, just available, the Seattle Lighting Department chronicles the beginning of the work on Diablo Dam designed to give the Gorge plant a dependable peak capacity of 40,000 kw., says that machinery for Cedar Falls unit No. 6 has been ordered and may be in operation for next winter's peak, and urges the immediate construction of a second Skagit transmission line at a cost of $2,218,000 and the immediate installation of a third unit at the Gorge, to develop 25,000 hp. and operate in 1928, and of the first two 40,000-hp. units of the Diablo plant, to operate in 1929. This 105,000 additional horsepower is to cost $3,620,000—$600,000 for the Gorge and $3,020,000 for Diablo—or only $34.48 per horsepower. Later on another 40,000 hp. at Diablo is to cost $760,000. The report condemns the proposed Hanging Rock dam as uneconomical—"a financial and engineering blunder."

The report, after recording a substantial gain in earnings and output, makes the following reply to the argument for taxation of municipal plants:

> The average rate throughout the country for electric current for lighting during 1927 was 6.6 cents per kilowatt-hour as against 2.73 cents per kilowatt-hour for city light. The electric company sells approximately $3,400,000 worth of current in Seattle per year and the city $4,300,000 worth, making a total in the neighborhood of $7,700,000 per year in Seattle and vicinity. If this current were sold at the average rate prevailing throughout the country, it would cost the consumer $17,000,000, which indicates a saving from municipal competition of $9,300,000 per year. When we consider that the total amount of taxes for the city of Seattle for 1927 was $8,500,000, the argument that the city is losing a great deal of revenue because city light is not taxed entirely loses its force. As a matter of fact, the tax paid by our competitor for the year 1926 amounted to only 0.82 mill per kilowatt-hour of current sold.

The City Council has passed a bill appropriating $625,000 for the third unit and other equipment of the power plant and system at Gorge Creek. It is designed for completion in the winter of 1928-29.

## Political Echoes Resound in Public Utility Field

Charles M. Hay of St. Louis, a Democratic candidate for United States Senator from Missouri, in opening his campaign condemned public utility holding corporations that apparently are outside the regulation of the state public service commissions, indorsing the investigation proposed by United States Senator Walsh of Montana. Mr. Hay advocated rigid regulation of the sale of securities of such holding corporations and declared that Congress should conduct an honest and thorough investigation into the operations of the holding companies and then act promptly if remedial action can be taken.

Attorney-General O. S. Spillman of Nebraska is a candidate for the Republican nomination for United States Senator, contesting with Senator R. B. Howell, who won the place six years ago with a record as a municipal ownership man. In his statement to voters asking for support, Mr. Spillman makes much of what he terms his successful effort to curb "the power trust" by the injunction secured in Cedar County restraining the Interstate Power Company from cutting rates below cost to destroy a plant erected by the Hord company under a contract to sell the same to the city. He claims that it was an important victory because it established that in law electrical energy is a commodity, thus making it possible to prevent discrimination in prices as between communities.

Olin R. Holt, an attorney of Kokomo, Ind., has announced he will seek the Democratic nomination for Governor of Indiana on a platform pledging himself if elected to work for the abolition of the Indiana Public Service Commission. The law creating the Indiana commission was passed at the 1913 session of the Legislature.

Ex-Senator Frederick W. Hinckley, South Portland, Me., who is a candidate for the Republican nomination for Governor, is sponsor for a plan to bring electric light service to more rural sections of Maine. He declares: "I believe the time has come for the State of Maine to give financial aid toward the construction of transmission lines into these localities, and at the next Legislature this matter should have most serious consideration, with a view of putting it into practical effect. I know of no greater service the Legislature can render than this."

## Power Commission Interested in Herminghaus Decision

The Federal Power Commission has asked the Railroad Commission of California to defer its decision on the application of the East Side Canal & Irrigation Company for approval of the transfer of riparian lands and rights owned by that company on the San Joaquin River to the Southern California Edison Company. The Federal Power Commission's plea is based on the fact that the East Side company case is the outcome of the California Supreme Court's decision in the suit brought by the Herminghaus estate against the Southern California Edison over the matter of riparian rights in connection with the California Edison company's development of water power. The Federal Power Commission says that the United States, not having been a party to the suit, did not have its rights adjudicated and is not bound by the decision and that the Attorney-General is now considering a suit to establish the rights of the United States.

### Electrical Service in England Under Flood Conditions—Submarine Cables Versus "Beam" Radio—Electrical Contractors as Retailers—Rural Supply of Energy

By Bernard C. Holding
Editor of *The Electrician*

London, March 1, 1928.

When the Mississippi River so disastrously stepped out of its course a year ago very few people in this country could visualize what appalling disaster such an event can create. In January Londoners experienced for themselves, though on a very much smaller scale, its baneful effect. In that month the overflowing Thames burst through an embankment into a congested city area and within a few minutes drowned numbers of sleeping residents. The inundation took place in the night, but although a number of the power stations in the affected area were partly flooded, there was no single case of a failure to supply electricity, though one badly affected station had to requisition a supply from an interconnected plant. In many cases a supply was maintained only by the unremitting efforts of the power-station staffs, and in one instance an assistant charge engineer, at great risk to himself, remained waist-deep in water for five hours regulating the steam-driven rotary boiler-feed pumps, as the governor by which they were normally regulated had been put out of action by the flood. Although the damage done to the generating stations was comparatively slight, damage to substations, feeder pillars and other parts of the systems was considerable. A good deal of damage was done to consumers' installations, and one plant in an industrial area reported a drop of 100,000 kw.-hr. in its weekly demand.

The submarine-cable communication companies, which have long professed indifference to the growing competition of the "beam" radio system, have suddenly changed their views, and the government has been asked whether it will take steps to bring about co-operation between the two methods of communication. The chief obstacle in the way of the realization of such a proposal lies in the fact that it would be very difficult to formulate a scheme which would give the cable companies what they want without entailing considerable sacrifices on the part of the wireless interests. Meanwhile two eminent chartered accountants, one representing the cable companies and the other Marconi's Wireless Telegraph Company, are preparing a joint report on the whole situation. Pending the issue of this report, it would be unwise to anticipate any closer relation between the rivals.

The electrical contractors, who have not as a class shown particular interest in the retailing of electrical goods through a shop, are now beginning to pay attention to this side of the business. Many of them hold that an electric shop, unless supported by a flourishing installation business, is not a paying proposition, in view of the present state of domestic electrification in this country. Be this as it may, many hardware men, druggists, garage keepers, musical-instrument dealers and other retail traders have been quick to see the possibilities for the extensive sale of domestic electrical appliances and are planning to develop this trade. As an instance of the extent to which retailing has got away from the electrical trade, it has been stated by the sales manager of a company selling electric tools that only 2 per cent of his total sales of these appliances goes through the electrical trade. Realizing the coming competition, the electrical contractors are now actively discussing the potentialities of electrical shopkeeping.

The doubts that have long been expressed as to the ability of the national electricity scheme to give supplies to the "truly rural" areas, which now depend on oil and other primitive methods of illumination, were strengthened by a recent statement by the Minister of Transport, in which he said that after long and careful consideration he had evolved a plan for submission to the government whereby in certain rural areas electricity would be available for all who wanted it. Those who remember the promises—made while the new electricity act was before Parliament—that the scheme would "save British agriculture" are beginning to wonder whether they heard aright!

On the personal side, January saw the bestowal of a knighthood upon J. R. Brooke, the secretary of the Central Electricity Board, while W. T. Leech, director of telegraphs and telephones at the General Post Office, has been made a C.B. (civil division). As you have very likely already noted, the seventh award of the Faraday medal has been made to Prof. J. A. Fleming, F.R.S. Death has removed several important members of the electrical community. Among those whose loss will be widely felt are Leon Gaster, the founder of the Illuminating Engineering Society; Charles Vernier, probably the most prominent of our mains engineers, who was responsible for the laying down in County Durham of the first large 20,000-volt cable system in the world; Charles Day, a well-known lift engineer and a director of Waygood-Otis, Ltd., and James A. Harris, who at one time occupied important positions with the Westinghouse Electric & Manufacturing Company, Pittsburgh, and at the British Westinghouse Company's Manchester works.

## Louisville's 100,000-Kw. Automatic Hydro Station

WHAT the manufacturer calls by far the largest automatically controlled hydro-electric station in the world will soon be in regular operation on the Ohio River at Shipping Port, just below Louisville. This station was recently completed for the Louisville Hydro-Electric Company and will generate 100,000 kw. In design, construction and operation it represents a complete departure from conventional practice. The present installation consists of eight 12,550-kva. vertical-shaft generators operating on a terminal voltage of 14,000. Space is provided on the dam for two more generators in the future, which will bring the ultimate capacity of the station up to 125,500 kva. All generating and control equipment was manufactured by the General Electric Company.

*Shipping Port automatic station has unusual features*

The principal unique feature of the station resides in the electrical layout. The conventional switchboard has been entirely eliminated and has been replaced by individual control panels installed in cabinets or "cubicles" alongside of each generator. Each cubicle contains relay mechanisms for starting, running and stopping its generator, together with protective equipment for emergency conditions. A synchronism and voltage checking device makes it possible to connect a generator to its bus until electrical conditions are correct. In normal service the station is under the management of a supervisor centrally placed at his controlling cabinet. When the load demand increases the supervisor indicates by means of a signal light on a generator cubicle that this machine is needed on the line. The floor attendant immediately operates the starting button on this cubicle, and the gate-operating mechanism is put in motion, bringing the generator up to speed. As soon as the machine is in rotation the automatic control devices come into play and the incoming machine is placed on the bus as soon as its electrical conditions are correct.

The extremely erratic behavior of the Ohio river produces a head of water on the station varying from zero to 37 ft. The high-water low-head season lasts about three months of the year, and during this time the station will be shut down. When the effective head has reached 9 ft. it is possible to carry a light load on the generators, and this load is increased until a maximum head of 37 ft. permits the station to generate its full capacity. A peculiarity of the station is that there are no windows within 25 ft. of the generating room floor, as the station is virtually half under water during the flood season.

The dam and building, of which a bird's-eye view is shown above, were designed and constructed by the Byllesby Engineering & Management Corporation. The power generated is sold to the Louisville Electric Light Company, after transmission at 66,000 volts over two miles of line to the steam station of the company in the city of Louisville.

## Purchases and Mergers

*Stone & Webster Announce Another Group Organization of Large New England Companies — New Holding Company Has Plants in Five States*

STONE & WEBSTER have announced the formation of a voluntary Massachusetts association to be known as the Eastern Utilities Associates for the merging of New England public utilities which have gross earnings of $8,500,000. The companies immediately involved are the Blackstone Valley Gas & Electric Company, the Edison Electric Illuminating Company of Brockton and the Electric Light & Power Company of Abington and Rockland. They are already physically connected.

A new holding company to be known as the Atlantic Public Service Corporation will, besides water and ice concerns, take over six companies giving electric service and formerly controlled by the Atlantic Public Utilities, Inc. They comprise the Caribou (Me.) Water, Light & Power Company; the Shenandoah River Power Company of Meyer's Falls, Va.; the Potomac Valley Power Corporation of Petersburg, W. Va.; the Indiana Light & Power Company of Defiance, Ohio; the Ohio Northern Public Service Company of Bowling Green, Ohio, and the Provincetown (Mass.) Light & Power Company.

All necessary preliminaries having been complied with, the Delaware Electric Power Company (formerly the Wilmington & Philadelphia Traction Company) became a part of the United Gas Improvement Company system on the first of the month, in accordance with announcement.

The Dowagiac (Mich.) Light & Power Company has been taken over by the Middle West Utilities Company. The properties, consisting of the electric and gas distribution systems serving the city of Dowagiac and the village of Cassopolis, will be operated by the Michigan Gas & Electric Company.

The Central Power Company has purchased the distribution system from the municipality of Brock, Neb. The Village Board of Palmer, Neb., has agreed to sell its municipal distribution system and electric light plant to the Central Power Company, provided the voters approve in April.

The Wisconsin Power & Light Company has purchased a number of small electric lines in the vicinity of Prairie du Sac. These purchases embrace the Sauk-Prairie Light & Power Company, Sauk County Utilities Company and part of the lines of the Prairie Electric Company.

The Missouri Public Service Commission has authorized the Central States Edison Company of Delaware to purchase the common stock of the Gasconade Power Company, operating in Gasconade, St. Aubert, Bonnet's Mill, Osage City and other towns in east central Missouri. The company will pay $186,200 for the stock, which has a book value of $173,779.

Ownership of the electric light plants of Mansfield, Ava, Seymour, Norwood and Mountain Grove, Mo., has been transferred to the Interstate Power & Light Corporation of Chicago, which has purchased the systems from the Central States Power & Light Corporation of Davenport, Iowa.

The Indiana Public Service Commission has approved the purchase by the Interstate

Public Service Company of the Midway Electric Company of Shipshewana for $20,000.

The Suburban Power Company has been authorized by the Ohio Public Utilities Commission to sell its property in Erie, Sandusky, Wood and Lake Counties to the Erie Power & Light Company for $75,000.

Three Iowa towns sold their electric distribution systems in February—Jolley to the Iowa Public Service Company, Waukee to the Iowa Power & Light Company, and Halbur to the Iowa Public Service Company.

Stafford, Kan., has lost its fight before the Kansas Public Service Commission to prevent the sale to a private company of the municipal distribution system of Sylvia, an adjacent town which has been served for a number of years from Stafford's municipal power plant.

The M. B. Light & Power Company, operating in Morrisville, N. Y., and near by, has made application to the Public Service Commission for authority to transfer its franchises and system to the New York State Electric Corporation.

Eight million dollars is announced as the price paid by the Oklahoma Power & Light Company for the Charles Page utilities at Sand Springs (Electrical World, Feb. 25, page 423).

## Missouri Has 600,000 Hp. in Undeveloped Water Power

A survey of the undeveloped water resources of Missouri completed in 1927 by H. A. Buehler, State Geologist, showed approximately 600,000 hp. susceptible of profitable commercial development. Virtually all of the sites included in the list are now under permit, various corporations and individuals having obtained rights from the Federal Power Commission, and many of these permits are now being offered to public utility companies. The chief sites listed in the Buehler survey are:

White and James Rivers in Barry, Stone and Taney Counties, 220,000 hp.; under permit to the Empire District Electric Company of Joplin.

Black River, near Piedmont, in Reynolds and Wayne Counties, 30,000 hp.; under permit to W. H. Meridith of Poplar Bluff. The Black River Hydro-Electric Company took bids on construction of this project on June 24, 1927, but no further action has been taken, pending financing and arranging contracts for sale of energy.

Current River, in Carter, Ripley and Shannon Counties, 100,000 hp.; permit held by the Missouri Hydro-Electric Company of Kansas City.

Osage River, 6 miles above Bagnell, in Miller County, 100,000 hp.; permit held by the Missouri Hydro-Electric Company under option to Stone & Webster of Boston; Union Electric Light & Power Company of St. Louis considering taking over this project.

Gasconade River, in Pulaski and Phelps Counties, 100,000 hp.; permit held by the Central Missouri Power & Water Company.

The White River Power Company, through Hugh L. Cooper and the North American Company, has applied for a federal permit for the use of White River in Taney County, while the Gasconade River Power Company has applied for a permit to use Gasconade River in Osage, Maries and Phelps Counties.

## Briefer News

**Texas City Plant Will Generate 6,000 Kw.**—Construction of the Texas City electric power plant announced by the Texas Gulf Power Company will be started soon, according to P. J. Hayes of Galveston, district manager. The plant will cost approximately $350,000 and will have a capacity of 6,000 kw. From it there will be constructed a system of wooden-pole transmission lines to towns of the Gulf Coast section.

**North Carolina Town to Build Hydro Plant in Agreement with Mill Company.**—The town of Marshall, N. C., and the Marshall Mill & Power Company have entered into a contract whereby, on the approval of the voters, the town is to take over the company's water-power site on the French Broad River and rebuild and enlarge the mill plant. The mill will purchase power at $5,000 a year. The new plant will be rated at about 1,800 hp. and will, it is estimated, cost $175,000 besides $90,000 for the site.

### Coming Meetings

[A complete directory of electrical associations, with their secretaries, is published in the first issue of every volume. For latest list see Electrical World for Jan. 7, page 80.]

Northwest Electric Light and Power Association — Accounting Section, Portland, Ore., March 12. Berkeley Snow, 1208 Spaulding Building, Portland, Ore.

Oklahoma Utilities Association—Mayo Hotel, Tulsa, March 13-15. E. F. McKay, 1020 Petroleum Bldg., Oklahoma City.

Illinois State Electric Association—Hotel Abraham Lincoln, March 14-15. R. V. Prather, 205 Illinois Mine Workers' Bldg., Springfield, Ill.

National Electrical Manufacturers' Association—Policies Division, Edgewater Beach Hotel, Chicago, March 14-16. S. N. Clarkson, 420 Lexington Ave., New York.

Maryland Utilities Association—Emerson Hotel, Baltimore, March 23. G. S. Williams, 1005 Continental Bldg., Baltimore.

Southwestern Division, N. E. L. A.—Edgewater Gulf Hotel, Biloxi, Miss., April 3-5. S. J. Ballinger, San Antonio Public Service Company, San Antonio, Tex.

Nebraska Section, N. E. L. A.—Omaha, April 4 and 5. T. E. Browne, 1527 Sharpe Bldg., Lincoln.

Southeastern Division, N. E. L. A.—Miami, Fla., April 11-14. C. M. Kilian, 207 Bona Allen Bldg., Atlanta.

American Institute of Electrical Engineers — Baltimore regional meeting, April 17-19; New Haven regional meeting, May 9-11. F. L. Hutchinson, 33 West 39th St., New York.

American Welding Society—Engineering Societies Building, New York, April 25-27. M. M. Kelly, 29 West 39th St., New York.

American Electrochemical Society—Bridgeport, Conn., April 26-28. C. G. Fink, Columbia University, New York.

Missouri Association of Public Utilities—Jefferson City, April 26-28. F. D. Beardslee, 315 North Twelfth St., St. Louis.

Southwestern Public Service Association—Dallas, Tex., May 2-5. E. N. Willis, 403 Slaughter Bldg., Dallas.

Middle West Division, N. E. L. A.—Hotel Statler, St. Louis, May 9-11. T. A. Browne, 1519 O St., Lincoln, Neb.

American Society of Mechanical Engineers—Pittsburgh, May 14-17. Calvin W. Rice, 29 West 39th St., New York.

National Electric Light Association—Atlantic City, June 4-8. P. S. Clapp, 420 Lexington Ave., New York.

**European Tour for Engineers.**—Engineers associated in the Midwest Power Conference are planning to go abroad on an "international power tour," sailing from New York on Aug. 18. While in Europe they will visit large power plants and new developments in various countries. The tour will last six weeks and there will be time for sightseeing and scenery. Headquarters for the tour have been established at Suite 656, 25 Broadway, New York.

**A. W. Burchard's Aid to Arbitration to Be Theme of Memorial Luncheon.**—The American Arbitration Association is to hold a luncheon on March 15, at the Astor Hotel, New York, to signalize its appreciation of the contribution to arbitration made by the late Anson W. Burchard of the General Electric Company, first president of the association. The speakers at the luncheon will be Owen D. Young, Lucius R. Eastman and Julius H. Barnes.

**Philadelphia-Suburban Counties Gas & Electric Cuts Rates.**—A rate reduction to consumers of electricity in Philadelphia suburbs embracing a territory of about 1,400 square miles, with a population of more than 600,000, is announced by the United Gas Improvement Company, which says that the cut will result in a large saving to customers of its subsidiary the Philadelphia-Suburban Counties Gas & Electric Company. Under the new schedule the rate will be 10 cents a kilowatt-hour for the first 50 hours instead of 11 cents.

**About $2,500,000 Asked from Legislature for Ontario Hydro This Year.**—Hydro requirements bulk large in the Ontario government estimates for the year 1928, which were tabled in the Legislature on March 1. The total requisition for hydro purposes is $2,470,000. Of this, $400,000 is for transmission and distribution lines and rural distribution in connection with the Niagara system. The largest single item is for the St. Lawrence and Ottawa Hydro system, $1,250,000 being set aside for transmission lines and $350,000 for transformer stations on this system.

**Modesto-Don Pedro Transmission Line Ready in Spring.**—Construction work on the Modesto Irrigation District's direct transmission line from Modesto to Don Pedro, under way for ninety days against adverse conditions, is progressing rapidly, and completion in the spring is assured, according to B. W. Creim, chief electrical engineer of the district. This line, on the north side of the Tuolumne River, is to be 40 miles in length. It will insure the district against interruption in service, according to Mr. Creim, who further believes that it will pay for itself in from five to six years through reduced cost of transmission, even though the rate of consumption does not increase.

Missouri Commission to Inquire Into St. Louis Energy Rates.—The Union Electric Light & Power Company of St. Louis having shown in its annual report a net income above all expenses and interest charges of $5,214,479 for 1927, an increase of $927,142 over 1926, certain newspapers are agitating for a decrease in rates, and the Missouri Public Service Commission, with this object in view, has requested the company for additional data. The residential rate is the one where a cut is thought particularly desirable by the commission if it proves feasible.

Specifications for Mackenzie River Plant at Eugene, Ore.—Bids have been advertised for a portion of the equipment to compose the first 9,000-hp. unit of the 18,000-hp. Leaburg development of the city of Eugene, Ore., known as hydro-electric power plant No. 2 of that city. The Leaburg development requires a diversion dam on the Mackenzie River, 20 ft. high, with three 100-ft. gates and a 30-ft. sluicegate. Tie-in with the present system will be effected by 10 miles of 44,000-volt transmission line from Leaburg to plant No. 1 at Waterville.

Birmingham's Street - Lighting System to Be Tripled in Two Years.—It is the ambition of James Jones, Jr., president of the City Commission of Birmingham, to make that city the best-lighted in the South. He announces that the city is about to complete two new "white ways," one on Fourth Avenue North and the other in the West End on Tuscaloosa Avenue. The first "white way" includes about 100 new lamps and the second 126. In December, 1926, Birmingham had just 501 street lamps; in December, 1927, it had 927, and it plans to have 1,527 by December, 1928, Mr. Jones states.

Permits Sought for Arizona Sites on Colorado River.—Application has been filed with the Federal Power Commission by the Arizona State Board of State Institutions for the development of a hydro-electric project at Grand Wash on the Colorado River. It is stated that 400,000 hp. may be obtained at this point by the construction of a 383-foot gravity dam. The board will also file similar applications for hydro-electric plants at Pearce's Ferry, Flowersack Rapids, Devil's Slide and Bridge Canyon. Applications for hydro-electric plants at these places have also been filed by the Arizona High Line Canal Association.

Oswego, N. Y., to Negotiate for Further Water-Power Rights on Canal.—Oswego, N. Y., wishes to acquire the riparian rights at the east end of Dam No. 6 in the Oswego River so that the city may use the full flow of the river at the dam. Both the Battle Island Power Company and the State of New York claim ownership of these rights, and the city will probably open negotiations with both while awaiting a judicial decision on ownership. The Battle Island company, it is stated, has asked on previous occasions $100,000 for its rights. The municipal power plant at the west end of Dam No. 6, now nearing completion, contains two extra wheel pits for use if the city obtains the rights to the power at the east end.

Indianapolis Church Adopts Floodlighting as Permanent Attraction.—So pleased were the members of the Broadway Methodist Episcopal Church in Indianapolis with the result attained by floodlighting their new building during the week set aside for dedication exercises that they decided on a permanent installation which is now in operation. The Robbins Electric Company placed four 1,000-watt floodlamps on the four sides of the tower, and the Indianapolis Power & Light Company supplies the electrical energy.

Gould Street, Baltimore, Will Soon Raise Consolidated Company's Rating to 260,000 Kw.—The increase in the Consolidated Gas, Electric Light & Power Company's generating capacity provided by the completion of the first unit of the new Gould Street power station and the rapidly approaching completion of the second unit is noted in the company's annual report, just issued. Completion of the new unit will bring the company's total rating to approximately 260,000 kw., to which is added an available hydro-electric supply from the Pennsylvania Water & Power Company's Holtwood plant amounting to 80,000 kw. With the close of the year a new agreement was made with the Pennsylvania Water & Power Company covering a period of 43 years, making it co-extensive in time with the 50-year contract between the Consolidated and the United Railways & Electric Company of Baltimore for the supply of power to the last named.

Maine's 66,000-Volt Line Nearly Completed.—The Central Maine Power Company is finishing its high-voltage transmission line from Gulf Island to Maxcey's, a distributing center. An interesting feature of this line is the crossing over the Kennebec River at Brown's Island. In order to maintain the clearance for shipping required by the United States government it was necessary to erect five steel towers, the two largest of which are 190 ft. high. They provide for jumping the river in two spans of 825 ft. and 95 ft. each. At Gulf Island an addition to the present substation has been built of 15,000 kva. capacity, stepping up the current from 33,000 volts to 66,000 volts, which can be raised later to 110,000.

Convention of American Oil Burner Association.—Plans for co-operation between oil producers and electric light and power companies in serving the users of oil-heating apparatus will be an important topic at the annual convention of the American Oil Burner Association, to be held at the Hotel Stevens in Chicago on April 3-5. A representative of one of the large electrical companies will speak on the relation of the central station to the oil-heating industry, and the interest of the oil producers in the utilization of oil fuel by owners of homes and commercial buildings will be discussed by an official of one of the large oil companies.

Zilwaukee Plant Extension on the Saginaw Three-quarters Completed.—Work started by the Consumers Power Company last May at its Zilwaukee steam plant on the Saginaw River, near Saginaw, Mich., is more than three-quarters finished. The extension consisted of a 30,000-kw. Allis-Chalmers turbo-generator, four 1,234-hp. boilers, a 3,500-kw. General Electric house turbine and 45,000 kva. in additional transformer capacity. The original installation at Zilwaukee was 40,000 kw. in two units. In addition, the greater part of the 41,500 kw. generated on the Au Sable River and the 13,000-kw. output of the plants of the Wolverine Power Company on the Tittabawassee feed into the outdoor substation. When the new unit is on the line there will be about 125,000 kw. concentrated at the Saginaw River plant.

Radio Standardization Furthered by the A. E. S. C.—An effort to stabilize the radio industry through the establishment of national standards of construction and quality of radio apparatus is being made by the American Engineering Standards Committee, which announces the election of Dr. Alfred N. Goldsmith, president of the Institute of Radio Engineers, to the chairmanship of its committee on radio standardization. The radio committee includes in its membership representatives of the departments of War, Navy and Commerce as well as of the radio industry and interested national associations and groups. Other radio committee members just elected are Dr. Clayton H. Sharp of the Electrical Testing Laboratories, vice-chairman, and C. B. Jolliffe of the United States Bureau of Standards, secretary.

Quebec's Revenue from Water-Power Rights.—A report presented to the Legislative Assembly of the Province of Quebec by the Minister of Lands and Forests shows that revenue from water powers in that province is growing large. For the year ended June 30, 1927, it totaled $802,010. The still incomplete development of the Duke-Price Power Company at Ile Maligne has just come into the revenue-paying class, paying the province $9,775. Of the $802,010 mentioned, $468,103 came from the five big dams constructed by the Quebec Streams Commission, which can furnish a flow for many additional developments.

Mr. Blackwell Talks on Prevention of Accidents.—Plans for the prevention of accidents to workers in the public utility companies of Ohio, West Virginia and Kentucky were discussed at Cincinnati last week as part of an open conference of the accident prevention committee of the East Central Division, N.E.L.A. H. C. Blackwell, president of the Union Gas & Electric Company, Cincinnati, asserted that accidents are nearly always due to carelessness on the part of the men injured and their disregard of the instructions laid down by the management. "We have found that the only remedy for carelessness is either to discharge or to lay off," he said. "All work should be done under predetermined specifications couched in the language of the men who are to obey them." He urged that responsibility in the case of a large utility organization be centered in one man, but that that man have committees of the various departments working under him.

Interconnection in Minnesota.—Speaking before the annual convention of the Minnesota Federation of Architectural and Engineering Societies, held at Minneapolis Feb. 17 and 18, on "Local Electric Power Stations Versus Interconnection," Oscar Gaarden, sales engineer Northern States Power Company, reported: "As nearly as can be determined, there are in Minnesota today 860 communities receiving central-station electric service. Of these, 746 receive service from interconnected systems and 114 have isolated plants. Of the 860 communities, 230 are served on the retail basis by the largest system, 155 by the second largest, 83 by the third largest, 44 by the fourth largest, 35 by the fifth largest, 114 by small transmission networks and 43 by isolated private plants. Of the 156 communities served by municipal distribution systems in the state, 85 purchase energy from transmission lines and 71 have isolated plants. Of the total number of communities served, 18 per cent are owned by the municipality and 82 per cent by private companies."

Oregon Officials Oppose Further Permits for Hydro Plants on Intrastate Streams.—Oregon's fish and game authorities have announced a definite stand against the further construction of any hydro-electric plant along any state stream or river with exception of locations in the vicinity of headwaters. The fish commission assumed this attitude following a hearing before the State Engineer which involved applications filed by the city of Eugene for authority to establish additional hydro facilities on the Mackenzie River. State Engineer Luper has taken the Mackenzie River dispute under advisement.

# Commission Rulings

Public Notice of Consolidation in Nebraska a Condition Precedent.—The Nebraska Railway Commission, by a two-to-one decision in a telephone merger, has determined that a constitutional provision regarding the giving of public notice covering at least 60 days to stockholders of the contemplated consolidation of competing public utilities is mandatory, not directory, and is a condition precedent to its approval of the consolidation. The minority of the commission held that since that body has no authority to settle disputes between stockholders and no power of management, its duty in the matter of approving consolidations ends when it finds that the proposal is in the public interest. It will assume that the officers of the corporation will obey the constitutional mandate and is without power to make such obedience a condition of approval.

Utility May Be Compelled to Serve Below Cost.—In refusing the Lincoln Telephone & Telegraph Company permission to raise rates at its Endicott exchange to a level where a return on the investment would be insured, the Nebraska Railway Commission held that public utilities may on occasion be required to continue the operation of portions of their property which may be unprofitable, and even though such operation involves a loss, it is not confiscation of property. The commission held that the proposed rates in the case under notice were greater than the service was worth, would result in depriving a number of patrons of telephone service and enable the company to do indirectly what it has not been able to do directly, bring about the abandonment of the exchange. The law requires a 60 per cent petition of patrons for abandonment, and this the company was unable to obtain. The commission maintained that the test of whether the service is worth the rates is what subscribers on adjoining exchanges pay without protest. It pointed out that, while charged with the responsibility of authorizing rates which are not confiscatory to the utility, it must also provide a rate which is fair to the rate-paying public and not in excess of the value of the service.

# Recent Court Decisions

Right and Wrong Charges to Jury on Negligence of Company.—A judgment for the defendant in Iron City Grain Company vs. City of Birmingham—a suit for damages for destruction of plaintiff's place of business by fire because of alleged negligence by the city in furnishing electricity and maintaining equipment—has been reversed by the Supreme Court of Alabama. This court found erroneous a charge that if the jury could reconcile the evidence with a theory that the defendant was not negligent, it was the jury's duty to do so, and a charge that before the jury could find for the plaintiff it must be satisfied that the facts were inconsistent with the theory that defendant was not negligent was declared confusing and misleading. There was, however, no error in charging that the law did not presume the defendant negligent or that defendant had no duty to maintain wires inside plaintiff's building, there being evidence that the city installed the wires without compensation. A charge that proof which showed only that a thing could have happened in a given way did not warrant the conclusion that it did happen that way was not a reversible error, though it might have been refused. (115 So. 99.)*

"In the Public Interest" Means "Not Detrimental to the Public."—In remanding the case of the Electric Public Utilities Company vs. West to the Maryland Public Service Commission (Electrical World, Feb. 25, page 422), the Court of Appeals of Maryland defined "the public interest" as conceived by it. The commission, as before chronicled, had refused to permit the Electric Public Utilities Company to purchase from Thomas O'Hara the stock of the Home Electric Light Company of Lonaconing, the Emmitsburg Electric Company, the Antietam Electric Light & Power Company and the Midland Electric Light Company, four Maryland corporations, because it could not "see wherein the public will be benefited in the slightest degree." The Court of Appeals on this point said: "In the case of an owner of the stock of such a company is it within the rule of reason to hold that he may not sell his stock to a corporation unless it can be shown that the public will be benefited by the sale? Or may permission be refused merely because the only consideration moving the parties is one of financial investment which the parties believe to be for their mutual advantage? We think not. If public utilities could be owned only by people whose primary purpose is to benefit the public, few of them would be privately owned. Until human nature changes, enlightened self-interest as the moving cause of enterprise is about the best that can be expected. To prevent injury to the public in the clashing of private interest with the public good in the operation of public utilities is one of the most important functions of public service commissions. It is not their province to insist that the public shall be benefited as a condition to change of ownership, but their duty is to see that no such change shall be made as would work to the public detriment. 'In the public interest,' in such cases, can reasonably mean no more than 'not detrimental to the public.'"

# News About Men of the Industry

**Rufus E. Lee**, formerly president of the Continental Gas & Electric Company and at the present time an investment banker with headquarters in Omaha, has been made head of the Tax Research Association of Nebraska. This association concerns itself with the task of scientific study of taxation with the idea of making recommendations to the Legislature for reforms. Mr. Lee was a pioneer in Nebraska's electrical development.

**Carroll G. Bennett**, formerly chief engineer of the Illinois Commerce Commission, has been appointed chief engineer for the Public Service Company of Northern Illinois. Mr. Bennett's early experience was with the Allis-Chalmers Manufacturing Company and with L. B. Stillwell, consulting engineer, New York. He spent some time with the department of water supply of New York City before removing to Springfield, Ill., in 1921, as assistant chief engineer of the Illinois commission.

**William W. Trench**, assistant secretary of the General Electric Company, has been elected secretary of the company to succeed Myron F. Westover, who retired March 1. Mr. Trench has been associated with the General Electric organization since 1915, when he was appointed assistant to Owen D. Young, who at that time was a vice-president. One year later he was named assistant secretary. Mr. Trench is a graduate of St. Lawrence University and the Brooklyn Law School and was admitted to the bar in 1916.

**Abel Reynolds** has been elected treasurer and general manager of the New England Water, Light & Power Associates, with headquarters in the Hospital Trust Building, Providence, R. I. This organization was recently formed under the presidency of Arthur B. Lisle to operate and control the Central Connecticut Power & Light Company and various water companies in eastern New England. Mr. Reynolds was in the employ of the Narragansett Electric Lighting Company, Providence, for 29 years and was not long since appointed superintendent of the Bristol County Gas & Electric Company, Rhode Island.

**Myron F. Westover**, who for almost 40 years has been actively identified with the electrical industry, retired March 1 as secretary of the General Electric Company, the office he had held for 34 years. In 1888 Mr. Westover became secretary to Charles A. Coffin, who at that time was treasurer and manager of the Thomson-Houston Electric Company. Thus began a close friendship and business association which lasted nearly 40 years and was brought to a close by the death of Mr. Coffin less than two years ago. In 1893 Mr. Westover was elected assistant secretary of the General Electric Company, which had been organized only the year before. The following year he was elected secretary, the office he had since that time held.

## *F. D. Mahoney Now with Electric Bond & Share*

F. D. Mahoney, whose resignation as vice-president of the West Penn Power Company was announced in the Feb. 11 issue of the Electrical World, has assumed his new duties with the Electric Bond & Share Company with headquarters in New York, where he will engage in the expansion of that company's interests in foreign countries. Mr. Mahoney's resignation as vice-president of the West Penn Power Company brought to a close an affiliation which dates back to June, 1922. From that time until 1927 he was commercial manager in charge of the department that developed new business, formed the distribution engineering department, stressed the merchandising of appliances and in other fields made itself an active part of the organization. In 1927 he was named vice-president.

*F. D. Mahoney*

A graduate of the University of Wisconsin, Mr. Mahoney began his engineering career as lineman's helper, and after serving in various capacities with central stations in the Middle West he joined forces with the electrical engineering department of the American Gas Company at Philadelphia. Here he secured a wide and varied experience in the construction and operation of public utilities. After the war Mr. Mahoney joined the Alabama Power Company as commercial manager, where he remained until his connection with the West Penn system.

---

**J. E. Aldred**, president of the International Power Securities Corporation, and J. A. Walls, vice-president and chief engineer, sailed for Europe March 3, aboard the *Leviathan*. They will visit the properties of the companies in Italy and France in which the International is interested.

**T. F. Manville, Jr.**, a director of the Johns-Manville Company, has been elected a director of the Morison Electrical Supply Company, New York.

# Obituary

**George McQuaid**, director of public relations for the Central & Southwest Utilities Company, an Insull property, died suddenly March 5 at his home in Dallas, Tex. Mr. McQuade was one of the best-known newspaper men in Texas and Oklahoma, having been identified with various newspapers in those states for 30 years. He was a native of Alexandria, Va., and a lawyer by profession, but soon after opening an office at San Antonio he relinquished his legal practice to enter upon a journalistic career. He served on the staff of such papers as the Kansas City *Journal*, the Guthrie (Okla.) *Capital*, the *Daily Oklahoman*, the Galveston *News*, the Dallas *News*, etc., in capacities that ranged from reporter to managing editor and editor. In 1922 he took charge of the Texas Public Service Information Bureau, which issues weekly news regarding the utilties operating in Texas and about public utilities in general. Subsequently he affiliated himself with the Insull interests.

**Alexander Siemens**, who for many years was associated with the famous engineer and inventor Sir William Siemens and until the World War was the chief representative in Great Britain of the great Siemens electrical interests, died Feb. 16 at Milford-on-Sea, England. The deceased, who was 81 years of age, was a Hanoverian, but became a naturalized British subject in 1878. Settling in England in 1867, he entered the shops of the telegraph factory then recently established by Siemens Brothers at Woolwich, and in the two following years he was engaged in the erection of the Indo-European telegraph line in Persia and in laying cables in the Black Sea. Later he spent seven or eight years in assisting Sir William Siemens with the design and application of the latter's regenerative furnaces. After the death of Sir William, in 1883, he assumed a more important position in the firm of Siemens Brothers, and ultimately he became its chief permanent director resident in England. Alexander Siemens was twice president of the Institution of Electrical Engineers, in 1894 and 1904, and in 1910-11 he was president of the Institution of Civil Engineers.

# Financial and Statistical News

## *Utility Stocks Move Up*
## *Bond Redemptions Heavy*

IN THE face of general market weakness power and light stocks have recovered substantially and many have established new high points. American Gas & Electric has touched a new high of 142½ after a run up of twenty points. Public Service of New Jersey common is up four points to 133. Gains are recorded also by Electric Power & Light, Brooklyn Edison, Commonwealth Edison, Pacific Gas & Electric, etc. The average of fifteen representative power and light common stocks is again at 130, which is the high point for all time for this group of stocks.

Bond redemptions continue at a high rate. Nearly $195,000,000 of bonds and notes were called this month for payment in advance of maturity. Although figures are not yet complete, it is understood that utilities are responsible for a large proportion of the total. Obviously, this means a big reduction in interest charges through the substitution of lower coupon obligations and, in some cases, stocks.

## Record Monthly and Yearly Energy Output

As has been usual in the past, electrical energy output of public utility plants in January almost equaled that of December, when all records were broken and production for the first time exceeded 7,000,000,000 kw.-hr., according to data collected by the U. S. Geological Survey.

January production was 7,179,000,000 kw.-hr.; for December it was 7,218,000,000 kw.-hr. In each of those months the output was greater than in the entire year 1903. These figures are an indication of the tremendous increase in the use of electricity in recent years.

The average daily output in January was 232,100,000 kw.-hr., a trifle less than the revised figure for December of 232,800,000 kw.-hr., but 6.5 per cent greater than in January, 1927. The total production of electricity by the use of water power amounted to 2,719,952,000 kw.-hr. and closely approached the December figure, the highest ever attained. It constituted 38 per cent of the total in each month.

The total production of electricity in 1927 by public-utility power plants was 79,723,000,000 kw.-hr., an increase of about 8 per cent over the total output for 1926. The accompanying table gives the monthly figures of output for 1926 and 1927, including street railways and other utilities as well as electric light and power companies.

| | 1926 | 1927 | A | B | C |
|---|---|---|---|---|---|
| January | 6,159 | 6,730 | 9 | 32 | 35 |
| February | 5,629 | 6,080 | [illegible] | 34 | 36 |
| March | 6,178 | 6,717 | 9 | 37 | 38 |
| April | 5,812 | 6,416 | 10 | 40 | 40 |
| May | 5,849 | 6,582 | 12 | 40 | 41 |
| June | 5,920 | 6,475 | 9 | 38 | 39 |
| July | 5,955 | 6,455 | [illegible] | 34 | 38 |
| August | 6,175 | 6,684 | 8 | 34 | 36 |
| September | 6,221 | 6,607 | 6 | 33 | 33 |
| October | 6,594 | 6,929 | 5 | 33 | 34 |
| November | 6,482 | 6,874 | 6 | 35 | 36 |
| December | 6,817 | 7,218 | 6 | 35 | 38 |
| Total | 73,791 | 79,767 | 8 | 35 | 37 |

Column A shows percentage of increase in 1927; column B shows percentage of output produced by water power in 1926; column C the percentage so produced in 1927.

New York Central Electric Changes Set-Up.—The New York Central Electric Corporation has filed a certificate in the office of the Secretary of State increasing its number of shares from 50,000 preferred stock, $100 par value, and 200,000 common, non-par value, to 100,000 preferred stock, $100 par value, and 200,000 common, non-par.

## Associated Gas & Electric to Create $50,000,000 Issue

Stockholders of the Associated Gas & Electric Company at a meeting to be held March 12 will vote on the creation of a fifty-million-dollar issue in the form of 4½ per cent debentures dated March 1, 1928, and maturing March 1, 1948. The company wishes to provide funds for the retirement of certain of its 5½ per cent and 6 per cent convertible debentures, for the acquisition of property and for other corporate purposes. The directors of the company voted on the plan at a meeting held Feb. 16.

# Attwill Replies to Critics

### Massachusetts Commission Chairman Defends Contract Plan of Regulation—Reproduction Base Assailed

A DEFENSE of the so-called regulation by contract bill (House 170) before the legislative committee on power and light in Massachusetts was recently presented by Chairman Henry C. Attwill of the Department of Public Utilities in rebuttal to arguments against this measure by Sheldon E. Wardwell, representing the Massachusetts Gas and Electric Lighting Association, and by others. The opening argument of Mr. Attwill on behalf of the bill was abstracted in the ELECTRICAL WORLD March 3, 1928, page 479, and the gist of Mr. Wardwell's address is printed on page 509 of this issue. In his rebuttal the chairman of the Massachusetts board maintained that the bill's chief objective is to insure a continuance of past standards of regulation in the Bay State, declaring that the credit of the companies would not be impaired by its acceptance and defending the measure's constitutionality. He spoke in part as follows:

The attitude of the Department on this bill is a sincere desire to advance the interests of the public utilities and the public alike. The suggestion, I think, was made first about 1922 in a report to the Legislature, in relation to the so-called premium law. Since then we have discussed it more fully, and we believe that it is in the interest of the public utilities; that is, those who desire to do real public service to the Commonwealth, and of course it is hostile to those who do not desire to do real public service for the state.

The reproduction theory involves the value of the property by adding absurd factors of cost. We concede that probably in dealing with the situation in the West, the Supreme Court at Washington, after it had once determined that the fixation of rates in any way was a judicial question, found that there was not much of anything that it could have done because no one knew the real investment in the utilities in the West, on account of the tremendous inflation of capital there.

The trouble with the reproduction theory is that it is extremely difficult to operate it, so difficult that it practically negatives regulation. Under that theory of regulation the department cannot hope to treat with more than two or three rate cases in a year, and so it is obvious that the whole power of regulation of rates is paralyzed.

Moreover, these gigantic holding companies and associations, buying up our local companies, owned and controlled by gentlemen living out of the state, who have no interest in Massachusetts traditions or ideals, cannot be expected to do anything but to get every dollar that it is possible for them to get out of the utilities, because they have no interest in Massachusetts other than the amount of money that they can make out of the state. It is to their interest to continue this method of regulation, because they usually furnish the management of the companies and usually have another company that furnishes the management of the local company under contract agreement. Furthermore, in every rate case it appears that they furnish the experts, the accountants, all the paraphernalia, to make the reproduction study and cost, and furnish the witnesses to testify.

Now, we believe this bill is constitutional; if it is not, very likely the present railroad act is not constitutional, because if a state cannot make a contract except a contract which ceases to be good, except so long as the corporation can make a return upon the property, 8 per cent on the reproduction value of the property, it is obvious that the state never can enter into any contract except that it guarantee to pay the other fellow, but the other fellow is never bound to pay it.

I do not believe that can ever be the law in the United States of America. If it is, then it is time that the people of the United States had a constitutional amendment to take care of that situation. Now, the savings institutions of Massachusetts are the wonders of the world. They have attracted capital into them far more readily and far more quickly than these public utilities have ever attracted capital, and yet back of them is nothing to guarantee the investor except the integrity of the officials of the institution and the examinations by the Commonwealth from time to time to see that their investments are proper. Despite this, in the past century, I doubt if the interest charges in relation to the savings banks of Massachusetts have varied 1½ per cent. There is enough money in the savings banks today on deposit to buy practically every public utility in the state and not disturb a mortgage.

What I would like to do is to so operate the public utilities that I could divorce banking control from the utilities, and I would attract the money of these savings bank depositors readily into these public utilities and give them a better rate of interest than the savings banks do, and equally safe security.

If we can attract money readily into the state treasury on public loans at 4 per cent, with people relying upon the good faith of the Commonwealth of Massachusetts, do you have any misgivings that the public utilities, regulated under Massachusetts traditions and under Massachusetts ideals as they have been for a century, cannot attract capital enough to carry them on at low rates of interest? Why, how absurd!

Our opponents seem to think that our proposition commits the state to guaranteeing a return sufficient to make the stock stay at par. No, it does not do that, but it restrains the state from doing anything which would prevent it earning the dividends which would sustain it at par, and, on the other hand, it in no way commits the state to any hard and fast standard or rule upon which it can earn its dividends and its interest.

Efficiency has not come usually from the stockholders. They are efficient in shouting for dividends, not a doubt about that; but the ones who are entitled to praise for efficiency are usually the operating officials of the utilities, and there are many instances which have come to my attention where the operating officials were efficient in their duties, but were denied adequate compensation by these hungry stockholders.

All this bill does is to seek to insure the regulation of the past, regulation built up on the ideals and traditions of Massachusetts, and not borrowed from the wild and woolly West. And let me say to you that I doubt if there are any utilities in the country whose credit stands better than those in Massachusetts, who heretofore have been content and satisfied to operate under the rules and under the views and under the ideals and traditions that have obtained here in Massachusetts.

The companies have the temerity to come up here and say, if we continue the policy and the system that has pertained in the past we will ruin all the utilities, and that they will not be able to get any cash to finance their undertakings.

It has been my feeling for years that one of the greatest drawbacks to this so-called United States doctrine is that it creates hostile camps between the consumer on the one hand and the stockholder of the corporation on the other hand, where, as a matter of fact, if the corporation is fair, their interests are identical. The consumer gives the surplus; he donates to these gentlemen his streets; he gives them a monopoly. He ought therefore to have in return rates as reasonably cheap as they reasonably can furnish them.

Now, if the corporation is reasonable upon its part, his interest and the stockholders' interest are identical because he needs the service. He knows that there can be no extensions and additions to the capital plant unless he is willing to put the corporation in position to get a fair return upon the stock, which will make the stock attractive as an investment to the investor. Both their interests are conserved. Consequently, when we limit their operations to a fair and reasonable dividend, we assure any additional earnings being held in the treasury and employed in the public service. And by that operation we relieve them from being in hostile camps and we march them side by side, together in that interest of the Commonwealth and the welfare of its people.

I do not believe that we have got to such a stage in Massachusetts that we no longer have public-spirited citizens who are willing to work, and willing to work in the interests of the general public, at fair and generous compensation. This bill in no way contemplates a fixed return. It fixes the minimum return, but it permits the commission to allow any return above that which may be required to protect the financial integrity of the company and allow it to perform its public functions in the interest of the public.

We never will sustain the doctrines, traditions and ideals of men by sitting supinely in a chair and allowing these foreign interests that are coming into Massachusetts and gobbling up our utilities to ride roughshod over us.

If these gentlemen are right, this bill, if passed, will do them no harm. Moreover, it will put the Commonwealth in no worse position than it is now. Consequently, in my judgment, there is no sound reason why it should not be passed, and we will see what the result of its passage is.

## December Customer-Ownership Sales Exceed $16,600,000

December sales of stock directly to customers consisted of 290,300 shares, valued at $16,603,000 and involving about 18,130 transactions.

The total value is somewhat below the monthly average for the year, but exceeds that of February, July, August and September and is less than 10 per cent below November sales. But it falls short, by more than 40 per cent, of the figures for the peak months, March and October.

The average value of the transactions was unusually high, being nearly $920. Three companies reported sales exceeding $1,000,000 for the month, the actual amounts being, respectively, $1,560,500, $1,544,300 and $1,400,000, and in addition one company had sales exceeding $3,800,000 in value.

The preceding estimates are based on returns from companies serving somewhat over 12,000,000 customers at the end of the year and thus accounting for about 87 per cent of all customers served by companies in the United States making it a practice to sell securities locally.

WINNIPEG ELECTRIC REPORTS UNUSUAL INCREASE IN OUTPUT.—During the year 1927 the combined output of the Winnipeg Electric and its associate, the Manitoba Power Company, amounted to 511,103,200 kw.-hr. and the peak load for the system was 112,000 kw. These figures mark an increase in output of 80 per cent over the previous year, and an increase in the peak load of 70 per cent over the previous year.

## Industrial Development by New England Companies

The power committee of the New England Council recently reported on its survey of the activities of New England electric service companies in attracting industries to their respective territories. These companies were asked what they had done to attract industries to New England, what concrete results had been obtained and what plans were entertained for the future.

Of 53 New England companies reporting, only eleven claimed to have done any industrial development. None claimed to have obtained new industries solely through their own efforts. Their parts in industrial development included co-operation with chambers of commerce or railroads, advertising in newspapers, advertising in trade papers and magazines, listing available sites, issuing booklets, lending financial assistance and purchasing stock, purchasing and remodeling of buildings for industrial uses, solicitation by letter and in person of concerns interested in a particular territory, maintenance of exhibits at the various fairs and expositions, assignment of an industrial engineer or a sales department executive to industrial development activities, co-operation with industrial real estate brokers, and assisting communities in developing industrial survey programs. All of the reporting companies plan to continue such industrial development as they now conduct; all believe the work beneficial, but few have definite plans for additional efforts in the future.

## Capital Set-Up of New Stone & Webster Group Announced

The new association formed by Stone & Webster, Inc., known as the Eastern Utilities Association, as announced elsewhere in this issue, will be capitalized at 2,000,000 no-par common shares and 2,000,000 no-par convertible shares. The companies immediately involved are the Blackstone Valley Gas & Electric Company, Edison Electric Illuminating Company of Brockton and Electric Light & Power Company of Abington & Rockland.

One share of Blackstone Valley $50 par common stock will be exchanged for 2½ shares of common stock in the association and 3¾ convertible shares. One share of Edison Electric $25 capital stock will be exchanged for one common share of the association and 1¾ convertible shares.

The association's common shares are entitled to dividends of $2 annually before any dividend is paid on convertible shares. When $2 common dividends have been paid the convertible shares will be entitled to annual dividends of $1. Thereafter each convertible share will receive one-half the amount received by each common share. When net earnings for two consecutive years have been not less than $2.40 a share on common and $1.20 on convertible shares, the latter may be converted into common at the rate of two convertible shares for one common share.

## Undeveloped Water Powers in North Carolina

It is evident from the rate at which the production of electrical energy in North Carolina has increased during the past decade that new power sources must constantly be developed for many years in the future. In the past ten years the installed water power in North Carolina has increased from 325,000 hp. in 1918 to nearly 610,000 hp. at the end of 1927.

The Department of Conservation and Development estimates that undeveloped sites now controlled by public utility companies in North Carolina total about 400,000 hp., in addition to the 295,000 hp. which they now have under construction. In addition, sites are known to the department which have been the subjects of engineering examination sufficient to indicate that some 505,000 hp. of undeveloped water power is available from them. If this be added to the preceding 695,000 hp. estimated as controlled by the public utilities, there is at least a total of 1,200,000 hp. in undeveloped water power available in North Carolina. In this estimate numerous undeveloped powers known to exist have not been included because they are at present not economical to develop.

Portland Electric Pays Special Dividend.—Directors of the Portland Electric Power Company have declared a special dividend of $10.80 a share on the second preferred stock, payable 80 cents in cash and $10 in second preferred stock.

Illinois Power & Light to Issue Debentures.—To raise funds for the acquisition of certain properties the Illinois Power & Light Corporation will issue, subject to the approval of the Illinois Commerce Commission, $2,000,000 principal amount of notes or debentures, maturing in twenty years and bearing interest at the rate of 5 per cent per annum. The officers and directors have also arranged to bring $5,000,000 of new money into the fixed capital of the company by the sale of additional common stock.

## Company Reports

## New Capital Issues

First mortgage and refunding 4½ per cent gold bonds, series F, of the Interstate Public Service Company to the amount of $12,554,000 were offered during the past week at 94½ and interest, yielding about 4.85 per cent. These securities, dated March 1, 1928, are a direct obligation of the company, and are secured by a mortgage covering as a direct lien all fixed property now owned or acquired in the future. Proceeds will be used toward reimbursing the company for refunding bonds bearing higher coupon rates and for other corporate purposes.

The Oklahoma Power & Water Company issued first mortgage 5 per cent twenty-year gold bonds, series A, at 96½ and interest, yielding about 5.30 per cent, a piece of financing involving $4,500,000.

Six-dollar cumulative preferred stock was issued by the National Power & Light Company at $102 per share and accrued dividend, 101,126 shares being offered. Another offering of six-dollar cumulative preferred stock (no par value) was made by the West Texas Utilties Company at 96 per share and accrued dividend to yield 6.25 per cent.

Iowa Power & Light Company this week sold an issue of $6,000,000 first mortgage 4½ per cent bonds, series A, due 1958, at 95¼ and interest to yield 4.80 per cent. Proceeds will be used to retire $5,000,000 of 5½s and 6s due May 1, 1928, as well as for additions and extensions.

---

American Gas & Electric Increases Capital.—The American Gas & Electric Company, New York City, has filed a certificate in the office of the Secretary of State increasing its number of shares from 2,850,000, non-par value, to 4,600,000, non-par value.

---

Massachusetts Utility Increases Capital.—Greenfield (Mass.) Electric Light & Power Company at its recent annual meeting voted to increase preferred stock from $300,000 to $375,000, the new stock to consist of 3,000 shares of par value of $25 each. Proceeds from this issue will be used to reduce the company's floating indebtedness.

---

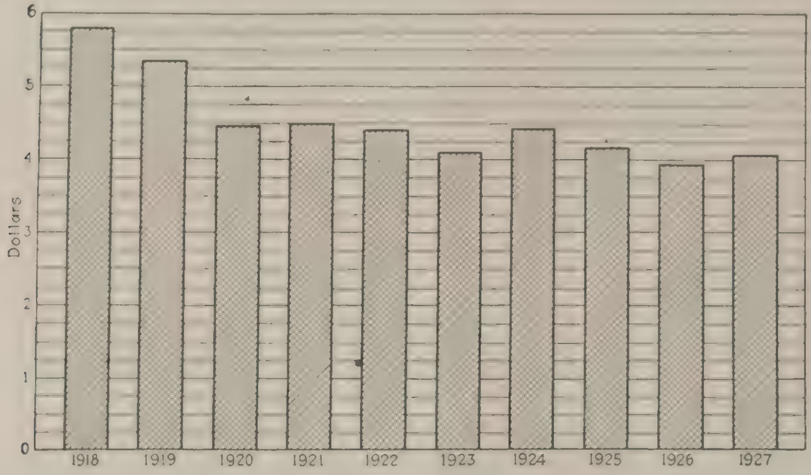
Lynn Gas & Electric Petition Approved.—The Massachusetts Department of Public Utilities has approved the petition of the Lynn Gas & Electric Company for the issuance of 19,500 shares of additional stock at $25 per value to be offered to stockholders at $75 per share.

# Western Massachusetts Companies Gain 10 Per Cent in Kilowatt-Hour Sales

ANTICIPATION of an excellent showing by the Western Massachusetts Companies and constituent properties during 1927 have been realized in the first annual report of this organization. This voluntary association came into being Jan. 15, 1927, and the properties embraced in the report consist of the Turners Falls Power & Electric, Greenfield Electric Light & Power, Lee Electric, Agawam Electric, Ludlow Electric Light, Amherst Gas, Easthampton Gas, Pittsfield Electric and United Electric Light (Springfield) companies. On Jan. 1, 1928, there were 940,528½ shares of common stock without par value in the association, or 96.4 per cent of the total outstanding shares of common stock in the constituent companies. The common shares were held by 4,781 stockholders and the present dividend rate is on the basis of $2 per share annually. There are no bonds or other evidences of indebtedness outstanding. The operating utilities controlled have combined assets of $36,082,403 and did a gross business in 1927, eliminating intercompany sales, of $8,189,877. They serve a population of about 400,000 and supply many diversified power requirements. Total energy sales after intercompany transactions were 403,814,360 kw.-hr., an increase of about 10 per cent over 1926. The total generating capacity of the plants of this group is 64,000 kw. in hydro and 71,500 kw. in steam power. During the past decade the business of these companies has increased 147 per cent.

The consolidated earnings statement of the operating companies for 1927 shows operating expenses of $3,270,926 and taxes of $1,295,757, net of $3,623,194 and total earnings (including other income of $136,694) of $3,759,889. Interest deductions were $256,977, leaving a balance of $3,502,911. The retirement reserve was $1,002,274, set aside by constituent companies in 1927 to meet the cost of plant and equipment replacements. Dividends of constituent companies totaled $2,829,415, leaving after balance $673,496. Other charges deducted were $182,070, leaving as addition to surpluses of constituent companies $491,425. The statement of the voluntary association itself showed total income, $1,036,160; dividends paid, $1,022,164, and balance to surplus, $13,996.

Since 1918 the investment in the combined constituent companies per dollar of gross income has fallen from about $5.80 to $4 and the total investment has increased from about $18,000,000 to $33,000,000. Gross income has risen from about $3,250,000 to $8,189,877 and accumulated reserves and surplus from $1,800,000 to $9,950,000 in round numbers. Sales of permanent power have increased from about 125,000,000 to 295,000,000 kw.-hr. The number of employees has increased from approximately 550 to 720. During the past year the affiliated companies expended $2,355,700 for additional electrical equipment and other plant items, and at present the United company, Springfield, is building a $900,000 main receiving substation in West Springfield and is increasing the capacity of its Indian Orchard hydro plant by 2,600 kw. at a cost of about $260,000.



*Investment per dollar of gross income*

---

## Norway Enters American Market

Oslo Gas & Electricity Works (Oslo Gas og Elektricitetsverker), Norway, made an offering during the first week of March of 5 per cent external sinking fund gold bonds, totaling $6,000,000, at 95½ and interest to yield 5.30 per cent. The Oslo Gas & Electricity Works was organized in 1920 by resolution of the Municipal Council of the city of Oslo for the purpose of combining under one management the gas and electric producing and distributing systems formerly operated by municipal government. The issue was oversubscribed.

---

## Continued Improvement in Utilization of Fuel

Revised statistics of the total annual production of electricity by public-utility power plants in the United States, compiled by the U. S. Geological Survey, indicate an output of 79,767,000,000 kw.-hr. in 1927, an increase of 8 per cent over the output for 1926. Of this quantity 37 per cent was produced by the use of water power, an increase of 1.6 per cent over the proportion for 1926. In kilowatt-hours the electricity produced by the use of fuel increased about 5½ per cent, and the electricity produced by water power increased about 13 per cent. It would have required about 27,000,000 tons of coal to generate the electricity which was produced by the use of water power. These figures cover not only energy for light and power, but include the output of other public utility plants as well.

The improvement in the average utilization of fuels that has been brought about by improvements in plant design and operation during the last few years continued in 1927. The operators of public-utility power plants performed the remarkable feat of generating about 2,500,000,000 more kilowatt-hours of electricity by the use of fuel in 1927 than in 1926 by the consumption of about 150,000 tons of fuel less than was used in 1926.

From 1919 to 1927 the average quantity of coal required to produce a kilowatt-hour of electricity has decreased from about 3.2 to about 1.8 lb. This is a notable performance, not only in the total amount of the reduction during the eight-year period—1.4 lb., or a reduction nearly as great as the present average rate of consumption per kilowatt-hour, but especially in the continuation of the improvement during recent years, when the limit of achievement in utilization of fuel under present conditions of generation of electricity has almost been reached. The reduction in the average fuel rate from 1926 to 1927 was about 0.12 lb., or almost 2 oz., per kilowatt-hour generated. With coal costing $4 a ton, it would require the savings on the generation of about 4,000 kw.-hr. of electricity to amount to $1 in fuel. The total consumption of electricity by ten average domestic customers in 1927 about equaled 4,000 kw.-hr. The apparently insignificant saving of 0.12 lb. of coal per kilowatt-hour amounted to about 3,000,000 tons of coal for the year, or, at $4 a ton, $12,000,000.

Tables accompanying the Geological Survey statement show the output and fuel consumption for 1927 for the United States and its main divisions, with the annual figures of output and fuel consumption and the average rates of fuel consumption per kilowatt-hour from 1919 to 1927.

# Business News and Market Conditions

## Industrial, Agricultural and General Employment Prospects

### Survey of Year's Business Indicates Steady Sales—New High Levels Expected in 1928—Situation Generally Promising Throughout the Country

SOME of the high points in a bulletin issued by the United States Department of Labor entitled "Industrial, Agricultural and General Employment Prospects for 1928" are summarized by states as follows:

*Alabama*—Outlook promising; increase expected in iron, steel and coal; textiles stationary; much public work and commercial building planned; farmers optimistic.

*Arizona*—Increased employment predicted in the major industries; agricultural activities to increase; several large construction projects.

*Arkansas*—Outlook very favorable, except for coal mines, textiles and lumber mills; activity in highway construction and building.

*California*—Industrial activity expected to reach normal first half of 1928; several large industrial plants starting; activity in highway and heavy construction, but no increase in building trades.

*Colorado*—Increase expected in several major industries and agriculture.

*Connecticut*—Metal-working and silverware to continue at capacity; improvement in textiles; increase in leather, paper and hat industries; $11,000,000 for highway work.

*Delaware*—Activity expected in machinery, shipbuilding and leather; less bright outlook in fiber industry; large building and public works program previously begun to continue.

*District of Columbia*—Large government departmental buildings started.

*Florida*—Major industries expect normal operating schedules; much road construction.

*Georgia*—Establishment of new industrial plants to continue; $35,000,000 for roads and municipal improvements.

*Idaho*—Major industrial plants report a satisfactory outlook.

*Illinois*—Increase in industrial employment anticipated; metal industries more optimistic; automobiles and railroads demand increased steel; much building.

*Indiana*—Gradual expansion in industrial employment anticipated; large increase in automobile production and in demand for steel.

*Iowa*—Improvement in industrial conditions; $28,300,000 in road construction; satisfactory building program.

*Kansas*—Employment to equal or surpass 1927; employment by public utilities will continue at same rate; building operations slightly under 1927.

*Kentucky*—Textiles expect increased business; coal mining curtailed; lumber stationary; building prospects fair; activity in highway and other construction.

*Louisiana*—Major industries predict better year than 1927 except lumber, textile and oil; increase in public work and farm acreage.

*Maine*—Textile outlook uncertain some places, operating to capacity elsewhere; increase in iron and shoes, but not in paper or lumber; farmers gloomy.

*Maryland*—Major industry prospects fairly satisfactory.

*Massachusetts*—Rubber, footwear, fabrics, printing, wire, leather, and paper to continue at capacity; cotton mill situation improved; normal increase anticipated in other industries.

*Michigan*—General industrial increase expected, particularly automobiles; 350 miles of concrete highway; slight decrease in building.

*Minnesota*—Outlook distinctly favorable; iron production to continue; highway construction, city improvements, lumbering and agriculture good; heavy business expected by flour mills and farm machinery manufacturers.

> *Contrary to precedent established in former Presidential election years, when the business world stood by awaiting results before charting programs, the opposite is true at this time. . . . Industry and business will mark new high levels in 1928. . . . All signs point to the biggest year in the history of the automotive industry. Iron and steel point to marked increases over 1927. . . . Building construction will compare favorably with the previous year. The position of agriculture shows improvement. Railroads will undoubtedly enjoy normal business. . . .*
>
> FRANCIS I. JONES,
> *Director-General U. S. Employment Service, U. S. Department of Labor.*

*Mississippi*—Outlook good except lumber and textiles.

*Missouri*—Outlook improves over 1927; automobile assembling plants to resume; iron and steel operations to increase; mineral shipments higher; building activity good.

*Montana*—Industrial prospects encouraging; industries, excepting lumber manufacturing, expect a slight increase; mining and oil development work anticipated; large construction projects planned; agriculture in good shape.

*Nebraska*—Rubber tire concerns working overtime; other assembling plants to resume; meat packing gains; large building and public works program contemplated.

*Nevada*—Industrial plants optimistic; 50 per cent increase in sugar beet acreage; decrease in building; extensive highway program.

*New Hampshire*—Shoe, textile and paper industries coming back to normal; others continue at maximum; normal building program; $3,000,000 for highway work.

*New Jersey*—Industrial conditions compare favorably with 1927; several industries continue on curtailed schedules; bright outlook in automobile lines; increase in iron and steel; textiles continue improving; large building program; $30,000,000 worth of bonds voted for state highway construction program.

*New Mexico*—Normal operations in major industrial plants and mining; building and other construction to increase; increase in highway construction.

*New York*—Prospect not particularly great; agricultural machinery, cameras, optical supplies, textile and shoe industries continue satisfactory; automobile industry to increase; part-capacity operations in locomotive, railroad equipment and electrical manufacturing plants; building program to continue.

*North Carolina*—Considerable construction work, including power plants and lines; major industries satisfactory.

*North Dakota*—Public works, power lines and railway construction in prospect; beet sugar production increasing.

*Ohio*—Outlook not altogether favorable; less building; $20,000,000 for highways; iron and steel, rubber goods and tires to show increase.

*Oklahoma*—Outlook, except coal mining, encouraging; industries expect improvement; textile and lumber companies are less optimistic.

*Oregon*—No increase anticipated; depression in lumbering continues and affects other industries.

*Pennsylvania*—Metal industries increase from curtailed to schedule; textile outlook favorable; less decrease in building, but much public work.

*Rhode Island*—High activity in metal and building trades to continue; increase in textiles; machinery to continue at maximum production; gradual pick-up in general.

*South Carolina*—New textile plants, satisfactory industry schedules; heavy construction and building activity.

*South Dakota*—Road and building construction active; prospects favorable.

*Tennessee*—Steady increase in textiles; building outlook good.

*Texas*—Much building and public work planned; textiles and lumber not particularly bright, but improving; farmers optimistic; increase in acreage.

*Utah*—Outlook fairly satisfactory; some increase in agriculture, live stock, highway construction and some lines of manufacturing.

*Vermont*—Optimistic, especially regarding marble, granite, talc and textiles; much reconstruction.

*Virginia*—New industrial plants near completion; prospects in nitrogen manufacture and artificial silk knitting; large highway work.

*Washington*—Optimistic; large pulp and paper mills and chemical plants to be erected; 150 new factories; building and heavy construction schedules big.

*West Virginia*—Continued increase in factory employment; airplane factories; increased public improvements; building to increase.

*Wisconsin*—Major industries expect fairly satisfactory schedules; fair prospects in building construction.

*Wyoming*—Slight increase in major industrial plants, oil refineries and sugar factories; material increase in agriculture and livestock; considerable construction.

*Sales of Washing Machines by Quarters 1923-1927 (Except Electrics)*

Electric Washing Machine Sales Shown Separately
(Data Supplied by American Washing Machine Manufacturers' Association)

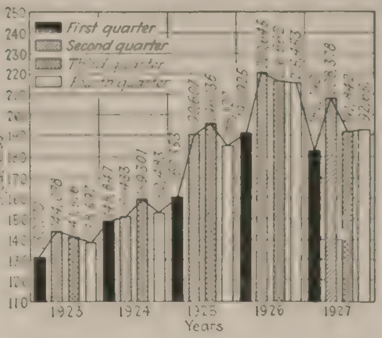
## Washing Machine Sales Decrease in 1927

Sales of all types of washing machines in 1927 amounted to 944,506, with a retail value of $127,750,000. This compares with 1,029,053 machines in 1926, with a total retail value of $137,525,000. Electric washing machines showed a decrease of about 8 per cent in 1927 as compared with 1926, the total number of washing machines sold in 1927 being 775,661. In April, 1927, 78,993 electric washing machines were sold, the largest number in any one month during that year. Lowest monthly sales were recorded in January and were 55,319. The difference between the best and the poorest month was 23,674 machines, or 36 per cent of the monthly average, 64,638. The five months having sales above the monthly average were March, April, June, September and October. The accompanying table gives sales by quarters from 1923 to 1927 for all types of washing machines and the accompanying graph records the sales of electric washing machines for the same period.



*Sales of electric washing machines by quarters, 1923 to 1927*

# Market Conditions

INDUSTRIAL equipment buying is active in the New England district. Orders amounted to about $275,000 and included a 6,000-kw. turbo-generator unit. Small motor sales are increasing and are up in volume to those of last year. An increase in appropriations for street lighting is noted throughout the district. Utility orders show an increase in the Eastern district, with substation equipment a feature of the demand. A New York company bought $320,000 worth of high-tension cable. The industrial demand continues active.

A satisfactory volume of small orders characterizes the business in the Southeast. Industrial plant orders and prospects are especially good. In the St. Louis district sales are at about a normal level and jobbers have been doing a slightly better business since March 1. Business is gradually increasing in the Middle West, though not to a marked extent. During February a large utility company bought at an average rate of $140,000 per day. On the Pacific Coast industrial business is especially active. A pulp mill in Gray's Harbor, Wash., ordered $12,000 worth of motors. A 10-ton pulp mill is to be built in South Bend, Wash., and a mining company in Tuolumne County will build a 3,294-hp. plant next July. Several sales of pumps and motors were reported for the irrigation and orchard districts in eastern Washington and Oregon.

### *Metal Markets Active—Some Price Improvement Noted*

Copper and lead sales have been active. The tone of the copper market is improved and the 14.125 cents price (Connecticut delivery basis) of the leading producers, which has been more or less nominal for many weeks, has been realized on large tonnages. Lead has been particularly active, though the price in New York is virtually unchanged. Zinc has been quiet, but sellers have not pressed their offerings, and business has been done at somewhat higher levels than last week. Moderate consumer buying of tin, with little change in price, is reported. Copper can hardly be said to be firmly established at 14.125 cents delivered in Connecticut, even though an unusually good tonnage was sold on that basis. On Tuesday all prices between 14 cents and 14.125 cents, Connecticut, were realized and a fair quantity for Middle West delivery was placed at 14.25 cents. In some instances it is probable that special brands or special shapes were a factor in the sales at the high end of the range. One or two sellers were willing to shade 14.125 cents on Wednesday, but the rest are firm at that figure and most of the business has been done at 14.125 cents.

NEW YORK METAL MARKET PRICES

| | Feb. 29, 1928 Cents per Pound | March 7, 1928 Cents per Pound |
|---|---|---|
| Copper, electrolytic | 13.95 | 14.125 |
| Lead, Am. S. & R. price | 6 | 6 |
| Antimony | 10½ | 10½ |
| Nickel, ingot | 35 | 35 |
| Zinc spots | 5.825 | 5.875 |
| Tin, Straits | 51⅛ | 51⅛ |
| Aluminum, 99 per cent | 24.30 | 24.30 |

Base copper price March 7, 1928, 15¼ cents.

### *Good Volume of Small Orders Reported in Southeast*

A reasonably satisfactory volume of small orders characterizes the electrical business in the Southeast. Virtually no orders for large equipment are being placed, though there is a satisfactory amount of that business in more or less immediate prospect. The largest central-station orders cover distribution and small power transformers for one company, totaling $17,000. The next order in point of size was for $7,300 worth of house-type meters. Another central-station order called for $4,500 worth of creosoted pine poles and bushings amounting to $1,700. The demand for meters and small transformers is generally good. One company in south Georgia ordered electric ranges, costing approximately $11,000, for use in a special sales campaign.

An order was placed last week by a new industrial plant in Georgia for inside wiring materials approximating $30,000, while an industrial plant in Tennessee ordered two electric welders costing $2,000. Bids have been asked on a textile mill project in Alabama for motors, transformers and regulators which will cost from $100,000 to $125,000. There is a considerable amount of industrial business, particularly in textile plants, now pending which should be announced within the next 30 to 60 days and contracts let at that time. One of these pending jobs is a silk mill to be constructed in Tennessee at a cost of $750,000. The improvement in construction lines is reflected in jobbers' sales. One of the most prominent jobbers states that his business for February was 25 per cent ahead of the same month last year. Municipalities are buying in good volume, though the individual orders are generally small. One Georgia town ordered $2,000 worth of line construction materials, while another municipality purchased street lighting equipment amounting to $1,100.

Construction projects are as follows: The Uriah Ice & Gin Company, Pensacola, Fla., plans an ice and cold storage plant to cost $100,000. The Plainville Brick Company, Plainville, Ga., plans a power station to cost $25,000. The F. S. Royster Guano Company, Norfolk, Va., plans a new fertilizer plant at Wilmington, N. C., to cost $125,000. The Willys-Overland Company, Toledo, Ohio, plans a new assembling plant at Columbia, S. C., to cost $600,000. The Gillette Grain Company, Nashville, Tenn., plans a new grain elevator to cost $115,000. Huntsville, Ala., Milledgeville, Ga., and Richmond, Va., plan ornamental lighting systems.

## *Utility Orders Increase in Eastern District*

Light and power companies are prominent in the market in the Eastern district and such business is showing marked improvement. Substation equipment continues as a feature of current commitments and inquiries are increasing. A central-station company in Brooklyn has placed an order for substation apparatus, including underground network protectors, totaling about $35,000. Wire and cable is more prominent in demand, following several weeks of dullness. A New York utility has contracted for a quantity of high-tension cable amounting to $320,000. A leading manufacturer of generating equipment reports a better volume of inquiries than at any time this year, with orders trending upward. A western Pennsylvania municipality has purchased a 500-kw. generator set and a New York central-station company will soon be in the market for a direct-current set of like capacity. A manufacturer of turbo-generators reports an order for a large unit for central-station service at San Francisco. Business in control apparatus is holding up well and out-door switching equipment is operating under more active call. High-tension line insulators are experiencing a sluggish market, with little change expected for several weeks.

Industrial demand shows little change. The call for motors and other apparatus is active. A manufacturer reports orders for 20-hp. motors for automobile plant service. Several paper mills in Michigan and Wisconsin are expected to place orders at an early date, and a rayon mill at Lewistown, Pa., is scheduled for heavy purchases for a plant addition to cost more than $1,000,000. Fractional-horsepower motors are in better demand and makers of smaller electrical appliances are receiving sizable orders. A manufacturer of electric refrigerators says that business has shown considerable improvement within the last few weeks as compared with earlier in the year.

The electrical market at Philadelphia is becoming more active. Central-station companies are making inquiries for substation and line equipment and good prospects appear ahead in these lines. Prime mover sales are slow. Industrial account shows betterment, particularly in connection with the iron and metal-working industries, which have been purchasing motors in larger-sized units. The local textile industries are showing expansion in their call for requirements for new installations.

Current construction activities are as follows: The Otis Elevator Company plans an addition to its plant at Yonkers, N. Y., to cost $200,000. Huschle Brothers, Inc., will add to its paper box plant at Long Island City to cost $125,000. The Public Service Electric & Gas Company will soon begin work on a two-story substation at Rahway, N. J. The Vacuum Oil Company plans an addition to its refinery at Paulsboro, N. J., to cost $100,000. Haverford College, Haverford, Pa., plans an engineering laboratory to cost $100,000. The Pennsylvania Power & Light Company will build a 66,000-volt transmission line from Berwick, Pa., to the Hanlock Creek plant of the Luzerne County Gas & Electric Company; surveys are also in progress for transmission lines in Hollenback, Dorrance and Dennison Townships. The Columbia Steel Company will make extensions in mill at Butler, Pa., to cost $1,000,000. The United States Engineer, Pittsburgh, will receive bids until March 28, for a hydro-electric plant at Lock 6, Allegheny River, near Clinton, Pa. The Allegheny Steam Heating Company, operated by the Duquesne Light Company, Pittsburgh, plans a new central power plant to cost $1,000,000. The Eastern Shore Public Service Company will build a transmission line from Salisbury to Vienna, Md.

## *Sales at About Normal Level in St. Louis District*

No marked change is noted in the St. Louis district. An order was placed by a railway company for machine tool motors amounting to $5,000. Another for substation control and switching equipment amounted to $35,000 and a lot of oil switches and circuit breakers was purchased by another central-station company for $22,000. One manufacturing company reports $150,000 worth of miscellaneous business in the southwestern part of the district for the first week in March. Indications of a slowing down of business in the Illinois coal mining region is probably owing to labor uncertainty after April 1. Jobbers are doing a slightly better volume of business since March 1.

Construction projects are as follows: The Camden Ice & Coal Company, Camden, Ark., plans an ice and cold storage plant to cost $90,000. The Arkansas Power & Light Company plans extensions in transmission lines at Tellville and Cotter, Ark. The Arkansas Cold Storage Company, Little Rock, plans an ice and cold storage plant to cost $100,000. The Bayou State Refining Corporation, Losston, La., will extend its oil refining plant to cost $200,000. Armour & Company, Chicago, plans a branch packing plant at Elk City, Okla., to cost $150,000. The Texas Ice & Fuel Company, Houston, plans a 40-ton ice plant on Canal Street, to cost about $60,000. The Texas-Louisiana Power Company, Pecos, Tex., has approved plans for addition to its power plant Muskogee, Okla., and San Antonio, Tex., plan ornamental lighting systems.

## *Business Gradually Increasing in Middle West*

The volume of business in the Middle West is gradually increasing, although not to a marked extent. Spring activity in industrial plants is becoming more noticeable and optimism is strongly evident. February production figures in the automotive industry are encouraging and considerable buying is reported in the agricultural districts. The coal situation in southern Illinois does not show any immediate signs of improvement, but the building situation has improved considerably. The various utility companies continue to be an important factor in general business, their purchases adding materially to the volume of business transacted. While the conservative policy of hand-to-mouth buying is still generally in effect, a somewhat less restricted attitude is being assumed toward future committments. General purchases during February were larger, one utility company averaging $140,000 per day. Among the interesting items placed this week were a motor order valued at $20,000 and an order for 400 assorted distribution transformers, 25, 37½ and 50 kva. Considerable construction work is under way. Small orders placed for such work are in excess of $50,000. Jobbers' sales are generally satisfactory. Municipal and railroad business is quite large. Appliances are moving in fair volume and the campaign last month on waffle irons resulted in volume sales of this appliance.

Construction projects are as follows: Columbia Mills, Inc., Chicago, plans a mill at West Pullman, Ill., to cost $200,000. The Reliance Dye & Stamping Company, Chicago, Ill., plans a three-story addition to cost $250,000. The Chicago, Burlington & Quincy Railroad Company plans a power plant to cost $50,000. The Caterpillar Tractor Company, East Peoria, Ill., will erect an addition to cost $200,000. The University of Illinois, Urbana, plans a testing laboratory to cost $400,000. The Interstate Public Service Company, Indianapolis, Ind., plans purchase of lines in Johnson, Bartholomew and Shelby counties. The Rollins Hosiery Company, Des Moines, Iowa, plans an addition to cost $100,000. Emmetsburg, Iowa, plans a municipal power plant. The Western States Public Utilities company will add to its power plant at Sheldon, Iowa, at a cost of $80,000. The Iowa Railway & Light Company will erect a power plant at Webster City, Iowa, to cost $38,000. Royal Oak, Mich., plans a new pumping plant for waterworks service, to cost $80,000. The Detroit Edison Company plans a one-story substation at Royal Oak, Mich., to cost $140,000. The St. Joseph Paper Board & Box Company, St. Joseph, Mich., plans a new mill to cost about $300,000. Earl Dickason, Chillicothe, Ohio, plans a baking plant to cost $125,000. The Vermont Marble Company, Cleveland, has filed plans for a plant on Harvard Avenue, to cost $100,000. Dayton, Ohio, will take bids for a central station for fire alarm and police signal systems, to cost about $50,000. The Defiance Dairy Products Company, Defiance, Ohio, plans a plant to cost $275,000. E. I. du Pont de Nemours & Company, Wilmington, Del., will extend its powder mills at Barksdale, Wis., to cost $400,000. The Wisconsin Power & Light Company plans a two-story storage and distributing plant addition at Berlin, Wis., to cost $25,000; also a similar plant at Portage, Wis. Evanston, Ill., Niles Center, Ill., and Cedar Rapids, Iowa, plan ornamental lighting systems.

## *Industrial Business Active on Pacific Coast*

Some excellent industrial business is reported on the Pacific Coast. A pulp mill in Gray's Harbor, Wash., bought $12,000 worth of motors. A 10-ton pulp mill is to be built in South Bend, Wash. A mining company also will build a 3,294-hp. plant next July in Tuolumne County. A Mexican mining company is in the market for motors and supplies for Mazatlan shipment. Ten elevator equipments and a distribution switchboard with a total value of $60,000 have been sold by the Westinghouse Electric Manufacturing Company for San Francisco installation. Other interesting orders include two motor-generator sets, valued at $5,000, for motion-picture service and two 200-hp. motors for a Honolulu sewage disposal plant. Another Honolulu order covers transformers, watt-hour meters, etc., valued at $8,000. Power company orders include one carload insulators for $7,500, 200 assorted 7,500-volt line switches and 10,000 assorted steel pins. The city of Anaheim is in the market for transformers and meters and the city of Los Angeles for meters, instruments and a carload of line switches.

Sales of motors and heavier apparatus in Seattle are reported from fair to good. The majority of sales cover pumps and motors for irrigation and orchard districts in eastern Washington and Oregon and small motors for replacements and minor additions to lumber mills and woodworking plants in northwest Washington and Gray's Harbor. The sale of four motor-driven pumps for a pump mill in Whatcom County is reported. Buying for pulp and paper mills, including one new plant and additions to two or more is expected this spring. The Great Northern Railway Company has awarded a contract for approximately $100,000 worth of insulators and line materials in connection with the completion of electrification of its main line from Wenatchee to the Cascade tunnel.

Construction projects are as follows: The Belmont Copper Company, Superior, Ariz., plans a flotation plant to cost $200,000. The Pacific Gas & Electric Company plans improvements at Lodi, Calif., to cost $75,000; also in vicinity of Yuba City, to cost $80,000. Riverside, Calif., is planning a 5,000-kw. municipal power plant. The National Ice & Cold Storage Company, San Francisco, plans an ice plant at Hollister, to cost $80,000. The Monolith Portland Cement Company will make extensions in its mill at Tehachapi, Calif., to cost $250,000. Walter H. Wheeler, Minneapolis, Minn., is preparing plans for a power plant at Polson, Mont., to cost $75,000. The California Petroleum Company, Sunburst, Mont., will extend its refining plant to cost $200,000. The Doernbecker Manufacturing Company, Portland, Ore., will add its furniture plant at a cost of $400,000. The San Juan Pulp Manufacturing Company, Bellingham, Wash., plans an addition to cost $100,000. Los Angeles and Santa Maria, Calif.; Great Falls, Mont.; Aubuquerque, N. M.; Oregon City, Ore., and Wenatchee, Wash., plan ornamental lighting systems.

## *Industrial Equipment Buying Active in New England*

An encouraging increase in buying is reported in the New England district. New installations and replacements of power equipment are being considered and a number of interesting purchases amounting to about $275,000 were noted. Orders included a 6,000-kw. turbo-generator unit with control apparatus, costing about $160,000; switchboard and power control equipment, amounting to about $25,000, for mill expansion, and an order for power control, consisting of switchboards, regulators and accessories, amounting to $75,000. Small motor sales are increasing and are up in volume to those of last year. Transformer inquiries are active. Central-station requirements are receiving more attention and orders are steady, with line hardware, wire and poles in good demand.

An increase in appropriations for street lighting is noted throughout the district, appliance sales are steady and wiring contracts for mercantile type construction and institutions are in good volume. Charles H. Tenney & Company, Boston, Mass., plan a power plant on the waterfront at Salem, Mass., to cost in excess of $1,000,000.

# Activities of the Trade

## Jefferson Electric Combines With Chicago Fuse Company

Announcement was recently made of the consolidation of the Jefferson Electric Manufacturing Company and the Chicago Fuse Manufacturing Company. The new organization will be known as the Chicago-Jefferson Fuse & Electric Company, with offices at Laflin and Fifteenth Streets, Chicago. The following are officers of the new organization: President, J. A. Brennan, formerly president of the Jefferson Electric Manufacturing Company; vice-president, A. R. Johnson, formerly secretary of the Jefferson Electric Manufacturing Company; vice-president, A. E. Tregenza, formerly vice-president of the Chicago Fuse Manufacturing Company; treasurer, J. C. Daley, formerly treasurer of the Jefferson Electric Manufacturing Company.

---

## Lincoln Opens New School for Instruction on Arc Welding

For many years a school of welding has been conducted by the Lincoln Electric Company, Cleveland, manufacturer of "Stable-Arc" welders, at its shop. The company recently entirely reorganized and re-equipped this school. Its purpose is the training of electric arc welders, no tuition or fees being charged. The course in the school occupies 30 days and is given in 12 lessons.

The pupils in the school work under the direction of a trained instructor, who teaches them both as a class and as individuals. All the educational work comes under the general direction of A. F. Davis, vice-president of the company. With 30 days intensive training, men are able to acquire a sound working knowledge of the fundamentals of electric arc welding and are fitted to engage competently in the trade. The company does not maintain an employment bureau for graduates of the course, but it does, if possible, fill such applications for men as are made to it from the school.

---

THE PETTINGELL-ANDREWS COMPANY, Boston, electrical jobber, announces that its name has been changed to the General Electric Supply Corporation. Frank S. Price, president, states that no change in ownership, organization or policy is involved.

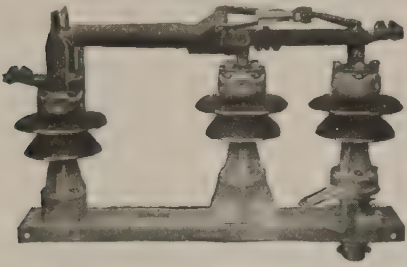
THE WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY has received an order for the complete electrical equipment of the shipping board freighters "Defiance" and "Triumph" which will be converted to Diesel-electric drive.

THE GENERAL ELECTRIC COMPANY, refrigeration department, has appointed J. J. Donovan as apartment house specialist. Mr. Donovan was formerly territorial representative with headquarters at Pittsburgh, Pa.

# New Equipment Available

## Disconnecting Switch

The 37-kv., 2,000 amp., type TTR gang-operated "Hi-Pressure" contact disconnecting switch placed on the market by the Railway & Industrial Engineering Company, Greensburg, Pa., has the operating parts above the insulator of non-ferrous metals and is fitted with monel metal bolts and pins at the vital points. The contact is made by rotating the blade into chrome steel reinforced jaws under pressure after the blade is operated into closed position. The rotating movement cleans the contact surface of corrosion and dirt. The pressure contact is released before the blade lifts, which the manufacturer claims makes its operation easy. The bearing on the rotating insulator column is equipped with Alemite lubrication.



*37-kv., 2,000-amp. gang-operated "hi-pressure" contact disconnecting switch*

## Manual A.-C. Motor Starter

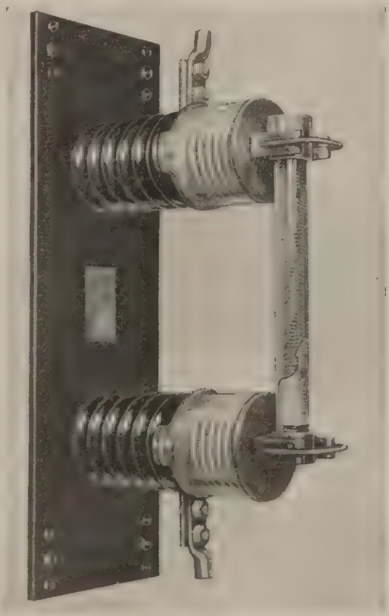
A manually operated starter for alternating-current motors up to 7½ hp., known as the C-H 9115, has been placed on the market by the Cutler-Hammer Manufacturing Company, Milwaukee. The switch mechanism incorporates the new C-H double-break roller contacts and wide-faced figures of heavy copper, cadmium plated. Thermal overload inverse time limit protection is provided. The mechanism of the starter is mounted on a "Thermoplax" panel, and knockouts are arranged on five sides of the box. The device has a two-part safety cover such that the lower part only can be opened for quick replacement of the fusible links in the overload cutouts, the upper part being arranged so that it can be locked if desired.

## Inclosed Circuit Breaker Potheads

The "U-Re-Lite" manufactured by the Cutter Electric & Manufacturing Company, Nineteenth and Hamilton Streets, Philadelphia, is now available in increased capacities for 440-volt and 550-volt alternating-current service as follows: The "Junior" three-pole unit up to 80 amp., the "Senior" three-pole unit up to 200 amp., the type "W" three-pole unit up to 400 amp., and the type "LL" three-pole unit up to 1,000 amp. The company states that, interpreted in dollars, this means that many circuits formerly requiring a "Senior U-Re-Lite" can now be protected by a "Junior U-Re-Lite" and similarly in the cases of the other breakers mentioned above, at no sacrifice in positive protection, but at a saving in cost. The capacities given for the various types are load-carrying capacities. For interrupting capacities the company refers to tests made by two utility companies.

## Potential Transformer Protective Combination

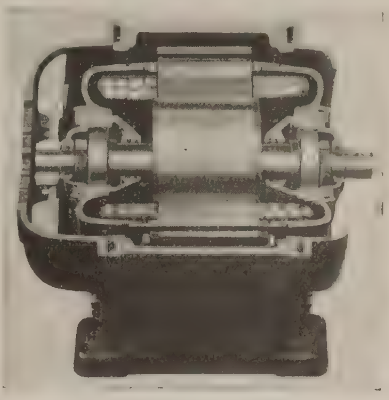
The type RR potential transformer protective combination has been placed on the market by Schweitzer & Conrad, Inc., Chicago. The equipment, as shown in the illustration, consists of combinations of a new current-limiting resistor and the type DLC ½-amp. fuse. The resistor has the S&C wire wound form of construction and is for indoor use only. The essential differences between this type of resistor and other S&C resistors are that the type RR unit occupies a minimum of space and it may be applied, without alterations, to any existing indoor fuse mounting. This new design thus makes it possible to add a current-limiting resistor to any indoor fuse mounting now installed in a potential transformer application.



*A protective combination for potential transformers*

## Totally Inclosed Motor

A new type of completely inclosed ventilated motor with a 40-deg. rating has been placed on the market by the American Electric Motor Company, Cedarburg, Wis., which recently became a subsidiary of the Splitdorf-Bethlehem Electrical Company of Newark, N. J. In describing this motor the company cites an unusual test to demonstrate how effectively dust is excluded from the windings. A glass case was filled with a mixture of sand, iron fillings and sawdust until the motor was half covered. An external fan on the motor churned this mixture, filling the air with it and completely surrounding the motor with thick dust. For two weeks the motor was run under these extremely adverse conditions. When the motor was opened the windings were so clean that a permanent magnet brushed over them showed no trace of filings. Nor had any sand or sawdust penetrated the cover. The inclosed hoods hermetically seal the winding. The hoods are telescoped into a ring fastened to the stator laminations, the surfaces of which are machined.



*Cooling is accomplished by driving the air through as well as over the stator laminations*

The cooling of this type P-K motor is such that air is driven through as well as over the stator laminations. The stator core is perforated. Air in the inclosed portion is agitated by malleable cast fans shrunk on the motor shaft. The ball bearings are of the cage type. The inclosing hood of the motor can be removed without disturbing the bearing, which remains on its shaft inclosed in its cage. The stator is removable. Should it be damaged it can be replaced in a few minutes. The rotor has the end rings electrically welded to the bars.

Polyphase Switches.—A line of polyphase switches built in sizes ranging from 60 amp. to 400 amp. with test connections and from 60 amp. to 600 amp. without test connections. These can be furnished with fuses sealable or accessible when the switch is in the "off" position. The switch is of slate base construction and the contacts are mounted on the top where they can be inspected in the "on" position.

# Electrical Patents

*Announced by U. S. Patent Office*

(Issued Feb. 14, 1928)

1,659,293. Electrical Device; W. Hermann, Chicago, Ill. App. filed Jan. 5, 1924. Electric igniters of the type employing a spring actuated drum and a cable which winds on the drum.

1,659,295. Lath Support and Loom Fastener; P. P. Kaufman, Appleton, Wis. App. filed July 23, 1925.

1,659,303. Connecting Block for Electric Wiring; L. H. Rovere, Richmond, N. Y. App. filed May 23, 1924.

1,659,312. Multiple Connecter; R. C. Colwell, Morgantown, W. Va. App. filed Dec. 11, 1924. For connecting a plurality of electric wires to a battery terminal or the like.

1,659,400. Electric Heater; J. M. Frank, Chicago, Ill. App. filed Jan. 21, 1924. Known as a grid heater.

1,659,421. Electrical Cigar and Pipe Lighter; C. D. Anderson, Ojus, Fla. App. filed March 29, 1927.

1,659,422. Clock; J. Bachtold, New York, N. Y. App. filed Nov. 23, 1926. Electromagnetic secondary clock.

1,659,429. Induction Electricity Meter; J. Harris, La Fayette, Ind. App. filed June 15, 1925.

1,659,447. Electrical Attachment Plug; C. F. Smith, New Britain, Conn. App. filed March 18, 1926.

1,659,463. Electrical Connecter; T. B. Entz, Brooklyn, N. Y. App. filed Jan. 24, 1924. For connecting the terminals of storage batteries.

1,659,464. Current Connecter; M. F. Fitzgerald, Winsted, Conn. App. filed July 24, 1924. For portable electrical devices such as flat irons, etc.

1,659,469. Transformer for Electric Arc Cutting and Welding Apparatus; F. C. Owen, Fayetteville, N. C. App. filed Nov. 14, 1925.

1,659,479. Electric Heating Unit or Element; A. Brown, Gore, N. Z. App. filed March 23, 1923. For heating or boiling water in kettles, etc.

1,659,502. Burglar Alarm Lock; W. J. Tyson, New York, N. Y. App. filed Dec. 4, 1925.

1,659,513. Electrical Steam Generator; C. B. Baughn, Visalia, Cal. App. filed Oct. 20, 1926.

1,659,515. Metal Clad Electric Switch Gear; H. W. Clothier, Wallsend-on-Tyne, and A. Allan, North Shields, England. App. filed April 21, 1925.

1,659,548. Transformer; S. E. Johannesen, Pittsfield, Mass. App. filed Sept. 8, 1926. A magnetic core and winding arrangement for transformers wherein those parts subjected to large differences of voltage are well separated and insulated.

1,659,549. Electrical Measuring Instrument; I. F. Kinnard, Lynnfield, and W. H. Pratt, Lynn, Mass. App. filed July 12, 1926. Of the induction type for measuring characteristics of alternating current circuits such, for example, as the conductance.

1,659,550. Method of and Furnace for Uniting Metal Parts by Fusion; C. Steenstrup, Schenectady, N. Y. App. filed May 29, 1926.

1,659,551. Electric Coupler; H. E. Van Dorn, Chicago, Ill. App. filed May 9, 1921. For automatically coupling together a large number of train circuits on one railway car with those on an adjacent car.

(Issued Feb. 21, 1928)

1,659,561. Electric Percolator; W. S. Bremer, St. Louis, Mo. App. filed June 4, 1926.

1,659,576. Carbon Holder; G. D. Brady, Detroit, Mich. App. filed April 17, 1922. Adaptable for projection apparatus.

1,659,582. Automatic Electric Control Device; J. F. Wiggert, Lead, South Dakota. App. filed April 12, 1927. For automatically regulating pressure or the like.

1,659,606. Synchronoscope; K. H. May, Berlin, Germany. App. filed July 15, 1927. Employing an induction disc and induction field elements co-operating with the disc such that the apparatus may be largely constructed from standard meter parts.

1,659,614. Wall Circuit Breaker; F. W. Roller, East Orange, N. J. App. filed Sept. 25, 1924. Applicable to the formation of control panels for lighting and other circuits of rooms, offices, residences and the like.

1,659,619. Protective Arrangement; O. C. Traver, Schenectady, N. Y. App. filed March 18, 1926. For systems comprising two parallel lines, especially when these are provided with a differential system of protection involving current transformers which are connected in series for normally circulating current, whereby further protection, such that either line alone may carry as much current as the two together, is provided.

1,659,623. Dynamo-Electric-Machine Stator; J. M. Barr, Milwaukee, Wis. App. filed Dec. 12, 1923.

1,659,646. Circuit-Testing Device; F. R. Weiss, Chicago, Ill. App. filed April 9, 1925.

1,659,648. Electrical Fitting; H. A. Douglas, Bronson, Mich. App. filed Jan. 27, 1926. For miniature lamp.

1,659,698. Massage Vibrator; N. E. Norstrom, Chicago, Ill. App. filed June 22, 1922.

1,659,706. Means for Suppressing Harmonics of the Transmitting Line Frequency; R. Rudenberg, Berlin-Grunewald, Germany. App. filed Aug. 25, 1926.

1,659,719. Blanket Warmer; G. E. Blake, Fort William, Ontario, Can. App. filed April 18, 1927.

1,659,729. Constant-Voltage Alternator; D. K. Gannett, Jackson Heights, N. Y. App. filed Nov. 24, 1923. In which the output voltage will be substantially constant regardless of variations in the exciting voltage.

1,659,731. Insulator; E. I. Green, East Orange, N. J. App. filed July 1, 1925. Adapted to stabilize the leakage loss under different weather conditions.

1,659,749. Electric Incandescent Lamp and Method of Manufacturing Its Illuminating Body; F. Skaupy, Berlin, Germany. App. filed Dec. 2, 1921.

1,659,759. Motor Controller; T. E. Barnum, Milwaukee, Wis. App. filed May 17, 1920. Combined starting and low-current cutout controller for alternating current motors having different circuit connections for starting and running.

1,659,774. Electric Heating Device; W. W. Hicks, San Francisco, Calif. App. filed Jan. 5, 1925. Hot plate.

1,659,779. Current-Controlling Device; T. J. Madigan, Brooklyn, N. Y. App. filed May 12, 1926. Automatic switch for electric heating devices such as flat irons.

1,659,862. Thermally-Controlled Electric Snap Switch; O. Dodge, Colorado Springs, Colo. App. filed Aug. 10, 1922. Cut-off mechanism for heated utensils.

1,659,864. Switch for Electric Flash Lights; R. M. Eaton, Niagara Falls, N. Y. App. filed Sept. 23, 1926.

1,659,897. Reflector for Radiant Heaters; J. Schoenfeld, Alameda, Calif. App. filed April 6, 1925.

1,659,904. Means for Regulating Traffic; F. E. Woodford, Chicago, Ill. App. filed Sept. 14, 1922.

1,659,911. Apparatus for Performing Soldering Operations; J. W. Fay, Villa Park, Ill. App. filed June 13, 1924.

1,659,914. Stop Action for Organs; W. E. Haskell, Brattleboro, Vt. App. filed Feb. 7, 1923.

1,659,920. Electric Welding Process; T. E. Murray, Jr., Brooklyn, N. Y. App. filed Dec. 18, 1924. In which a steel tube is provided with a fin or flange of copper for use in boiler walls.

1,659,921. Clamping Device; J. C. Nichols, Chicago, Ill. App. filed March 10, 1923. Which may be included in an electrical circuit and conduct current from the circuit to an article held by the device.

1,659,936. Molding Composition; H. F. Albright, Jr., Oak Park, Ill. App. filed Dec. 27, 1923. Comprising a compound composed of 8 per cent shellac, 21 per cent kauri gum, 55 per cent mica, and 16 per cent vermilion, and in addition a small quantity of rubber.

1,659,946. Apparatus for Heat Treating Articles; J. W. Fay, Villa Park, Ill. App. filed March 12, 1926.

1,659,951. Lamp Socket; J. Hohl, Newark, N. J. App. filed Dec. 5, 1922. Of cold moldable insulating material.

1,659,986. Electric Stove; O. F. Baughman and L. W. Cady, Lakewood, Ohio. App. filed April 2, 1925.

1,660,017. Switch Plug; J. Schoenfeld, Alameda, Calif. App. filed April 13, 1925.

1,660,041. Facial Treatment Method and Means; W. Meyer, Chicago, Ill. App. filed June 12, 1925.

1,660,052. Electric Heater; G. W. Shepherd, Terre Haute, Ind. App. filed Dec. 7, 1926.

1,660,070. Floor Switch; H. W. Crane, Chicago, Ill. App. filed Dec. 27, 1920.

1,660,080. Relay for High-Tension Fuses; P. C. McKendrick, St. Paul, Minn. App. filed May 25, 1925.

# New Trade Literature

MOTORS AND FIELD COILS.—Bulletins GEA-712A, GEA-918, GEA-919 and GEA-920 issued by the General Electric Company, Schenectady, N. Y., describe and illustrate respectively its type BTA adjustable speed, alternating-current, brush-shifting motors, the improved brush-holders for GE-73 and GE-240 railway motors and field coils with spring pads for GE-265 railway motors.

AUXILIARY EQUIPMENT.—The Cochrane Corporation, Seventeenth Street below Allegheny Avenue, Philadelphia, is distributing bulletin No. 676 covering apparatus for heating systems and industrial plants, including combined heaters and hot wells or storage tanks, deaerting heaters, steam and oil separators, traps, back pressure valves, filters and flow meters.

INCLOSED CIRCUIT BREAKER.—The Cutter Company, Nineteenth & Hamilton Streets, Philadelphia, has issued a supplement to its hand book of the "U-Re-Lite" covering larger capacity units of different types. Attention is also called to the multi coil U-Re-Lite, the separable contact U-Re-Lite and the extra long time-delay U-Re-Lite Included is data on short circuit tests made at the Hermitage Avenue station of the Commonwealth Edison Company of Chicago.

ELECTRIC APPLIANCES.—Catalog No. 3 issued by the Central Flatiron Manufacturing Company, Johnson City, N. Y., describes and illustrates the various "Betsy Ross" electric aids for the household and also includes a price list.

PROTECTIVE COMBINATIONS.—Bulletin AD1004 issued by Schweitzer & Conrad, Inc., 4421 Ravenswood Avenue, Chicago, describes and illustrates its type RR protective combinations for potential transformer applications in indoor locations.

STOKER.—A new publication issued by the American Engineering Company, Philadelphia, describes the Taylor coal-burning unit. A large drawing shows the Taylor unit driven by the Hele-Shaw rotary hydraulic motor.

OUTDOOR STATION EQUIPMENT, SWITCHES AND ELECTRIC FURNACES.—Bulletins GEA-505A, GEA-857, GEA-915, GEA-928, GEA-929 and GEA-930 issued by the General Electric Company, Schenectady, N. Y., describe and illustrate respectively its type TD-328 expulsion fusible cutout and disconnecting switch for short circuit protection and type EF-1 combined expulsion fuse and disconnecting switch for outdoor station equipment, the type E, form C expulsion type fusible primary cutout and disconnecting switch, the type LP-3 air break starting switches with round studs for synchronous converters, type LD-22 knife (lever) switches with laminated studs and the GE pot-type electric furnaces for lead hardening.

METAL AND NICKEL PRODUCTS.—The International Nickel Company, Inc., 67 Wall Street, New York City, has issued a fall 1927 buyers' guide on monel metal and pure nickel products.

# Foreign Trade Opportunities

Following are listed opportunities to enter foreign markets. Where the item is numbered, further information can be obtained from the Bureau of Foreign and Domestic Commerce, Washington, by mentioning the number:

An agency is desired in Singapore, Straits Settlements (No. 29,908), for storage batteries for automobiles.

Purchase is desired in Barcelona, Spain (No. 29,978), of battery chargers and molds and separators for batteries.

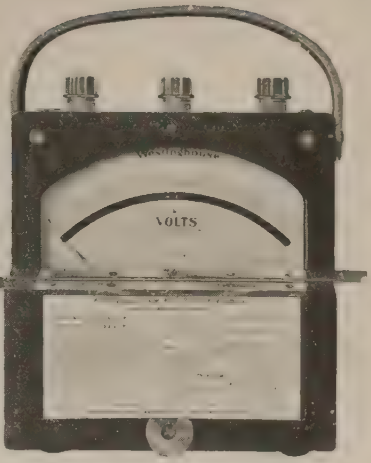
An agency is desired in Turin, Italy (No. 29,981), for electrical apparatus.

An agency is desired in Caracas, Venezuela (No. 29,942), for household electrical appliances.

Purchase and agency are desired in Rome, Italy (No. 29,925), for high-voltage insulators, radio, telegraph and telephone apparatus and wiring supplies.

Purchase and agency are desired in Goteborg, Sweden (No. 29,926), for household electric refrigerators.

# Positive Accuracy



PORTABLE instruments attain maximum usefulness only when they are accurate.

Westinghouse PY-5 instruments are recognized standards of instrument accuracy. Not only are these instruments particularly applicable for general testing and laboratory work, but they are also useful in calibrating and checking other instruments.

Remarkable compactness has been achieved in the PY-5 line—with no sacrifice of dependability. Maximum accuracy in reading is assured by a scale of full length for instruments of this class.

An outstanding feature of the PY-5 instrument is that the control resistors and shunts are mounted on the end plate with the terminals. The end plate can be quickly removed—a design which greatly facilitates the making of adjustments to the resistances, in case the user desires to recalibrate the instruments.

Each instrument is mounted in a sturdy case, the cover of which folds back, exposing the dial for reading when in use, and protecting the glass and scale from injury when not in use.

Type PY-5 instruments include a complete line of voltmeters, ammeters, and single-phase wattmeters.

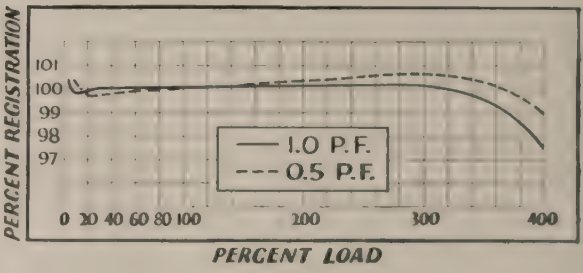
# The new SANGAMO
## TYPE H.C.
# METER



## STRAIGHT LINE ACCURACY TO 300 PER CENT—FULLY TEMPERATURE COMPENSATED

Since 1914 the fundamental design of Sangamo Type H Meter has not been changed. Proof of its dependability and performance is the fact that over four million have been placed in service.

Now, a few simple changes have produced a meter correct under all service conditions of load and temperature...the Type HC. However, the original design is so closely followed that many parts of the Type HC are interchangeable with corresponding parts in the Type H.

The load curve tells the story of HC super-accuracy...a straight line to 300 per cent. Temperature compensated means compensated at all power-factors, from 20 deg. to 120 deg. Fahrenheit. As with other good modern meters, voltage and frequency variation errors are negligible.

Mechanical improvements include a reinforced metal cover and positive location and locking of the permanent magnets. Compared with the Type H, the weight of the moving system is the same, the torque the same, the speed reduced. Direction of disk rotation has been reversed. In short the HC Meter has been standardized and modernized in every detail.

The Type HC is fully described in an addenda to Bulletin 67, which will be sent on request.

SANGAMO ELECTRIC COMPANY, SPRINGFIELD, ILLINOIS

“Megger” Ground Resistance Tester

# A direct-reading Instrument for testing the resistance to Earth —of Ground Connections

**BIDDLE SPECIALTIES**

- **“Megger,” “Meg” and “Super-Meg” Insulation Testing Instruments**
- **“Megger” Ground Resistance Tester**
- **Frahm Frequency Meters**
- **Frahm Tachometers**
- **Jagabi Speed Measuring Instruments**
- **Jagabi Rheostats**
- **Dionic Water Tester**
- **Siemens & Halske Precision Electrical Instruments**
- **Precision Potentiometers**
- **Scientific Apparatus**

THIS new “Megger” Instrument tests “grounds” merely by making one set of connections, turning the crank and reading the scale. No adjustments, no “balancing” and no calculations,—it reads like a voltmeter.

It offers definite advantage over other methods; and is of especial value not only because it is direct-reading —*“like a voltmeter”*—but because it is not affected by *severe* stray alternating or direct current in the earth —or by polarization or electrolysis.

“Megger” Ground Resistance Testers are now available with ranges as low as 0 to 3 ohms and as high as 0 to 3000 ohms; with 2 or 3 ranges in the same instrument. Already they are performing for “ground-testing” the equivalent of what “Megger” Testing Sets have done—for 25 years—for testing insulation resistance.

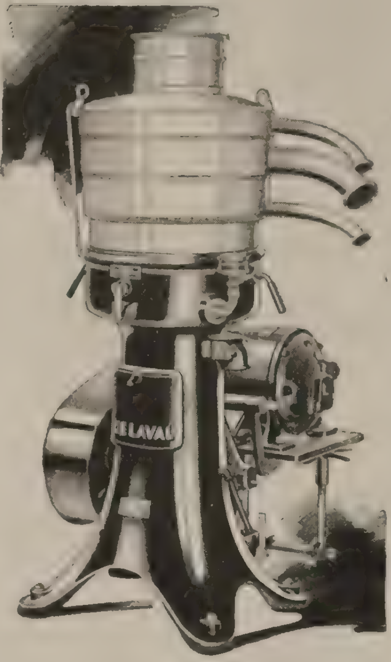
# Leadership

## ~ *among the leaders*

SINCE 1878, when De Laval invented the first continuously operated centrifugal separator, no one has thought of such a machine without thinking "De Laval." This year, as we observe our Golden Anniversary, De Laval leadership in centrifugally separating, purifying or clarifying various liquids is just as pronounced as it was 50 years ago.

De Laval's leadership is proved by the number and character of the organizations which are today adding more De Laval Centrifugals to their plant equipment. It is the result of rigid adherence to the De Laval policy of building the finest centrifugal machines that can be designed and selling them at the lowest prices made possible by its modern mass production methods; making no concessions in design, quality or price to offset the claims made for other machines.



THE list below shows a few of the nationally known organizations from which *repeat* orders for De Laval Centrifugals have been received during the past few months:

- American Gas & Electric Co.
- American Steel & Wire Co.
- Brooklyn Edison Co.
- Carnegie Steel Co.
- Devoe & Raynolds Co.
- The Ford Motor Co.
- General Electric Co.
- The Glen Alden Coal Co.
- Humble Pipe Line Co.
- Jones & Laughlin Steel Corp.
- The Lehigh Portland Cement Co.
- Nash Motors Co.
- Public Service Production Co.
- Reo Motor Car Co.
- Southern California Edison Co.
- Stone & Webster, Inc.
- U.G.I. Contracting Co.
- Union Electric Lt. & Power Co.

*In writing for information as to how De Lavals can best work for you, please ask for Bulletin 106-W on lubricating oil or Bulletin 107-W on insulating oil.*

*Three De Laval Oil Purifiers in the Hudson Avenue Station of Brooklyn Edison Company*

THE DE LAVAL SEPARATOR COMPANY

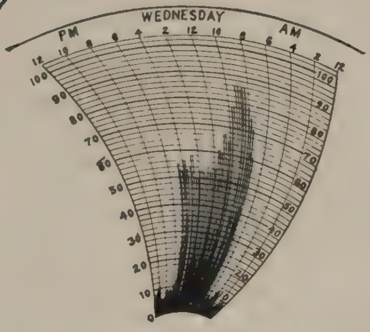
DE LAVAL PACIFIC COMPANY, 61 Beale St., San Francisco
ALFA-LAVAL CO., Ltd., 34 Grosvenor Road, London, S. W. 1

# DE LAVAL OIL PURIFIERS

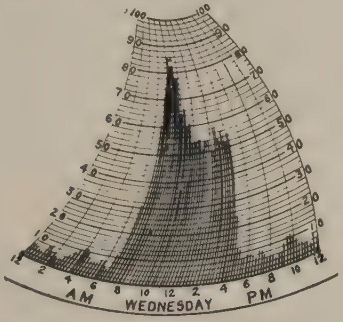
*Types for Lubricating Oil and Insulating Oil*

# *Improved* Demand Meters

## *Types G-9 and GS-9*



*Section of standard 7-day chart, as used to show accurately the time of maximum demand as well as the value.*



*Record of same all-day load as above but on inverted chart, which is advantageous for reading the time and the value of the smaller demands.*

The G type demand meters can be used with any type or make of watthour meter—they are flexible. They give a complete record for a week or longer on one circular 8-in. wax-coated chart that is easily filed. They produce a well-defined record that can be accurately read.

*Send for Bulletin GEA-903*

While these new meters adhere to the same fundamental principles of operation as the G-8 and GS-8, which they supersede, they embody several changes in design. These minor modifications, which are directed toward a general improvement of the line, are as follows:

1. The clocks are equipped with temperature-compensated balance wheels together with improved winding key and arbor.
2. The thermostat and its mounting also are improved.
3. Bronze bearing bushings have been added to important bearings in the mechanism and clock, and the stylus arm has been stiffened.
4. The general appearance has been made much more attractive; the meters are now finished in nickel and black throughout.

# GENERAL ELECTRIC

GENERAL ELECTRIC COMPANY, SCHENECTADY, N. Y., SALES OFFICES IN PRINCIPAL CITIES

# TWO WEEKS FROM TO-DAY

GENERAL ELECTRIC will introduce a new, complete line of porcelain-housed primary cutouts, the culmination of several years' development.

This line will establish new standards of value by reason of mechanical and electrical improvements, and especially because of greatly increased insulation strength which will place cutouts on a basis comparable with modern practice in line insulation.

The new G-E line will permit the economical use of high-grade cutouts on the lower-voltage distribution systems; it will also make available at reasonable cost unique and superior cutouts for higher-voltage systems.

## *Water Power Not in the Discard*

WHILE steam is and will be the mainstay of the electric light and power industry, water power is by no means in the discard. True, there have been wonderful improvements in steam-plant equipment which have added perceptibly to steam-station economy, and there are possibilities for still greater improvements; but that does not mean that water-power development will necessarily cease or that steam-plant production will totally eclipse water-power production. So far as hydro-electric possibilities are concerned, there are as good fish in the sea as ever were caught, nor has water-power development received the setback that many suppose. The Federal Power Commission is receiving applications for water-power development at the rate of one hundred a year. Construction has been definitely authorized for six million horsepower, of which two million is completed and in operation. Five and a half million more is under investigation by preliminary permittees, and fifteen million horsepower is covered by applications not yet acted on. Approximately one-third of the total electrical energy generated is produced from water power.

Unfortunately, the development of many large power sites is being held up temporarily for political reasons. For example, there are five projects on the St. Lawrence River, involving approximately five million horsepower of installed generating equipment, which cannot be acted on until Canada and the United States agree on an acceptable scheme of development. Thirty-four projects, representing nearly six million horsepower, are held up pending the ratification of the Colorado River compact. There are also awaiting action applications for sites on the Tennessee involving more than three-quarters of a million horsepower. Hydro-electric development has nevertheless been progressing at a fair rate, but it will not, because of the nature of the business and the location of the water power, grow as rapidly as steam-station development. However, there are many millions of horsepower awaiting development which economically cannot be touched, so far as price of output is concerned, by any steam station, and it would be unfortunate if the general improvements being made in steam-station design should blind operators to these hydro-electric possibilities.

* * * *

## *Stock Dividends and Public Relations*

THE flame of public criticism which is frequently turned upon the public utilities usually springs from misunderstanding or willful misrepresentation of some policy or practice pursued by them. The method of distributing earnings not infrequently has been the occasion, and the payment of stock dividends has sometimes been the center of attack. This has been represented as a means of obscuring unduly large earnings—of passing on to the stockholders the returns from exorbitant rates to consumers. Such arguments, although decidedly transparent, provide excellent fuel for unscrupulous politicians and others. Much or all of the misunderstanding would be avoided if those utilities concerned would point out to the public that through the stock dividend they have been able to obtain new capital cheaply; that, rather than pay out cash, they have issued stock-dividend certificates as evidence that a portion of earnings otherwise available for cash dividends has been transferred from surplus to capital account and permanently invested in the business. And this, incidentally, should answer the charge that the sole purpose of such dividends is evasion of income taxes.

Among others who should benefit from such explanation are certain writers of financial articles for newspapers who for the sake of arresting attention and providing striking headlines indulge in the use of such thoroughly misleading terms as "melon," "handout" and "Christmas gift." While the irrelevance of such expressions to the utility field is obvious to those familiar with financial practice, it may not be so evident to the general public. The use of such terms and the general misconception which exists involve the germ of much mischief to the utilities. It is much easier to eradicate the germ than to correct the mischief.

## *Time Lag of Spark Gaps*

ADVANCE in the electrical art has almost invariably been accomplished through empirical and cut-and-try methods. Discovery of a new phenomenon has always been followed by efforts in the shop and factory to make use of it, and generally the resulting product is only a first step which is soon outdistanced as the result of competent scientific investigation looking always toward improvement. Early devices yielded more promptly to the study of underlying principles because of their relative simplicity. However, with increasing values of power and voltage, with increasing demand for refinement of measurements and with the use of higher frequencies, many more involved relations have appeared, requiring longer and longer and more and more careful study.

One class of phenomena has been particularly obstinate and difficult to analyze—namely, the behavior of the high-voltage spark gap. The importance of the spark gap in all forms of protective equipment, and the consequent importance of knowledge as to its time lag in relation to the protection afforded, are well known. The matter has been studied for years, and many more or less conflicting explanations, none of them entirely convincing, have been offered in explanation of the time lag of the various types of spark gap. Early experimenters showed the influence of ultra-violet light and other evidence that the phenomenon of breakdown in gaps is related to the condition of the intermediate gas as regards ionization. In a general way it has been recognized that the final rupture of a gap occurs through ionization by collision, but no certain laws under which the behavior of a gap may be predicted have been proposed.

At the recent winter convention of the American Institute of Electrical Engineers a further contribution to this important and interesting field was made in the paper of J. J. Torok. Using a form of impulse generator different in form from that proposed by Peek some years ago, Mr. Torok has succeeded by reflection methods in cutting off the value of a voltage impulse on a gap at any point on the curve representing the rise of the surge. In this way and with the aid of photographic methods he has studied the successive stages of the initial discharge leading finally to sparkover. Contrary to accepted opinion, a large sphere gap is found to have a definite period of preliminary discharge. Further experiments revealed the important influence of the initial state of ionization in the gap both on the preliminary form and on breakdown value of the gap. The result indicated that it will probably be difficult to control these factors, thus suggesting that the sphere gap will always require very great care and can probably never be an instrument of precision.

An important application of this suppressed-discharge method is in the opportunity it affords for studying the distribution of high-voltage electrostatic fields, as, for example, the fields around suspension insulators with arcing horns, rings and similar equipment. The suppressed discharge method constitutes an important new instrument in the fields both of scientific research and practical engineering developments.

## High-Pressure Steam Winning Many Victories

PLENTY of expectation has been current that operating troubles would increase faster than a straight-line ratio using steam above 400 pounds pressure and 700 degrees total temperature. Through the eyes of ultra-conservatives apparatus for these heavy duties has been skeptically regarded in not a few installations. However, evidence has been growing that the art has been permanently advanced by raising pressures and temperatures, although the industry is still too much in the dark as to the economic justification of these new developments.

George A. Orrok gave the recent Midwest Power Conference at Chicago a valuable paper upon operating experience with high-pressure and high-temperature steam, and his conclusions that there now appear to be no serious difficulties up to at least 2,000 pounds are indeed significant with respect to the solution of the important physical and metallurgical problems concerned. Reports from a representative number of high-pressure installations declare that most of the anticipated troubles with equipment have been absent and that operating difficulties are on the whole no greater than with the ordinary 200-pound stations. Most of the troubles reported pertain to minor though essential equipment, like gage glasses, fittings, glands, gaskets, and so forth, and have been well taken in hand. The boilermakers state their readiness to guarantee service up to 900 degrees Fahrenheit when specified, and alloy steels for tubes, shells and castings are now available for more difficult operating conditions than have prevailed in the past. Operators report both thermal and commercial economy in the use of higher pressure, and this is borne out by repeat orders for similar apparatus, probably the best of all indications of success.

The favorable results which have been coming to light in regard to the operation of high-pressure and high-temperature plants should be supplemented in the near future by the release of more over-all cost data and analyses. When these become more generally available, engineers will be in a still better position to determine the most economical pressure and temperature to use in a particular case. Unless the economic factors in plant experience are liberally exposed to the analytical fire of the profession, progress will be slower than the splendid achievements of physical and chemical engineering in this field deserve.

* * * *

## Commercial Section Turning to Broader Objectives

PRACTICAL possibilities for constructive work by the commercial men of the power industry were never better indicated than at the meeting of the N.E.L.A. Commercial Section executive committee in Chicago last week. It was not that so much was accomplished. Rather, the time set apart for the meeting was more adequate and there ensued an unhurried discussion that went further afield and to more purpose than has been usual in the past.

For the last year or so undoubtedly the pressing problems of the residence market have held chief attention. This was well, for the great need has been to awaken the utilities to the passing of the old era of growth by the accumulation of customers, to confront them with the need for large-scale selling if expansion in this vast market is to continue. This work must go on until universal acceptance and action are realized. But undoubtedly a movement has been started. It has been reflected in many ways—the reorganization of the Society for Electrical Development, the holding of the intertrade merchandising conferences, the calling of the Industry Sales Conference, now at work; the appointment of a commercial director at N.E.L.A. headquarters, and the general quickening of executive interest. Meanwhile other committees have been at work, but the limelight has been on the domestic market.

Last week attention was also very definitely directed toward the field of power and industrial heating. Power has been more or less taken for granted in recent years, yet connected industrial customers are said to average only a 50 per cent utilization of electricity, and the use of steam, oil engines and private electric plants within easy reach of power lines still bulks very large. The difference in the extent to which power has been sold in different cities attests how great a factor good selling has been. And so it is with industrial heating. A tremendous volume of profitable factory load only waits upon an intensive study of local possibilities and the skilled man power needed to do the selling, not by talking power but by its intelligent application to the production problems of factories.

The meeting recognized that this work must now have energetic leadership—also that power men must take a more constructive part in the development of the wiring code. Such objectives can be facilitated by the new commercial director. Clearly, there is urgent need in all this work for a more effective procedure in the organization itself, that the work of committees can have more continuity, with less time and effort lost in meetings and between them.

* * * *

## *Standardize High-Voltage Tests*

SUCH a variety of tests are being conducted in high-voltage laboratories that the data produced are frequently contradictory and sometimes very unsatisfactory. Yet the relative and absolute performance of insulators, arresters and cables is of fundamental importance to development and practical application of high-voltage equipment. In order that data obtained in different high-voltage laboratories may be compared, it would be advisable to specify the steepness of impulse waves, the frequency for oscillatory tests and other details. An "impact" test is meaningless unless the wave is defined and the regulation of the test equipment measured. To determine these quantities precision instruments could be incorporated in each laboratory. Temperature, humidity and wind conditions are other essential elements that must be definitely specified to make test data comparable.

Whatever may be the opinions regarding the phenomena which actually occur on lines or the relative merits of different tests for duplicating operating conditions, it would be logical to make tests that are comparable. The proper instruments are expensive, but they are available, and high-voltage test technique has proved fully adequate to obtain reliable results if conducted under specifications. By studying the possibilties of such procedure engineering groups can devise test methods which will avoid the confusion now prevalent.

* * * *

## *Selling Only Part of Load Building*

UTILITY load-building programs do not end with contracts for power or for household appliances. The contract is merely a starting point for the formation of a seller-and-customer relationship which demands a great deal in cost and service from the seller. In large measure this fact is recognized by utility executives in building up a power sales program, because industrial specialists are carried on utility payrolls to serve as counselors to power customers. Funds are provided for advertising and sales agents to bring new industries into a territory, and in some cases the utility becomes a stockholder in the industrial enterprises. The utility accountants do not set up balance sheets per customer which embody all such indirect costs as part of the revenues and costs involved in kilowatt-hour billings.

The same principles hold good in load building with domestic customers. No utility should embark on an aggressive household load-building program without making provision for proper accounting and servicing. In the ultimate electrical home it will be profitable and necessary for the utility to provide a home-service counselor or service man. Load building in homes can stand on its feet as a merchandising business only when some degree of saturation is had in the use of electric appliances. In several cases, however, utility executives put all home load-building costs into an account called merchandising and expect a profit to show at the end of each year. For this reason some regulatory commissions point to red figures for merchandising and believe the utility is wasting money in an unprofitable business, and some utility executives wear long faces and think they have gone into an illusory business because of the same red figures.

In the initial stages of home load building it should be known that only small and well-introduced appliances can be sold on a profit-making merchandising basis. The range, refrigerator, water heater and other heavy-duty appliances must be pioneered and pushed into homes at a loss when they are considered as a merchandising enterprise and when they are new in a territory. They must be serviced often and promptly by the utility until other service agencies know how to do the work. Yet the only hope for ultimate development of business in the homes on an adequate and profitable basis lies in the sale of these pioneering appliances. Pioneering load-building costs are legitimate and should be met, but it is questionable practice to place all these costs in one account called merchandising and then have commissions and utility executives look askance at the red figures on the balance sheet because they do not understand the complete story of the costs involved in doing pioneering work in home load building. It would be well to divorce strictly store merchandising from home servicing and home appliance pioneering when computing costs for load building in homes.

* * * *

## *Cable for High-Voltage Transmission*

OVERHEAD transmission lines are exposed to mechanical and electrical hazards that make continuous electric service difficult and expensive. Multiple lines and circuits from multiple generating sources are required to give metropolitan service to a community. In some areas it has been suggested that high-voltage underground cables might be used to replace overhead transmission circuits and thereby render more continuous service because these cables would be immune from lightning and from the hazards of accidental mechanical contact. But great care must be exercised before drawing such a conclusion if the present service rendered by even low-voltage underground cables is under consideration.

Figures compiled over several years show about seven service failures per 100 miles of cable per year for low-voltage cables now in operation. This percentage of failure, translated in terms of high-voltage, single-conductor cable, gives a service continuity per 100 miles per year much inferior to that now rendered by a modern single-circuit 220-kv. overhead line. Many of these failures are not the fault of the cable manufacture, but the installed service is the only proper measure of service value. If cost values be also placed in the equation, it may be seen that any large use of high-voltage cable for transmission faces a very decided service and economic handicap.

The present state of the cable art is, however, no guarantee of future developments. There are no inherent technical handicaps to making reliable high-voltage cables, and, if available, their use would eliminate the hazard of mechanical contact inherent in exposed overhead lines. It is encouraging, therefore, to find high-voltage cables introduced and used in Chicago and New York to bring large blocks of power at minimum cost to areas of heavy load, because ultimate developments in the art point to possibilities of underground transmission which will give better service than can be expected from overhead lines. In the interim it is advisable to measure service values in terms of actual experiences.

# Line Construction Methods

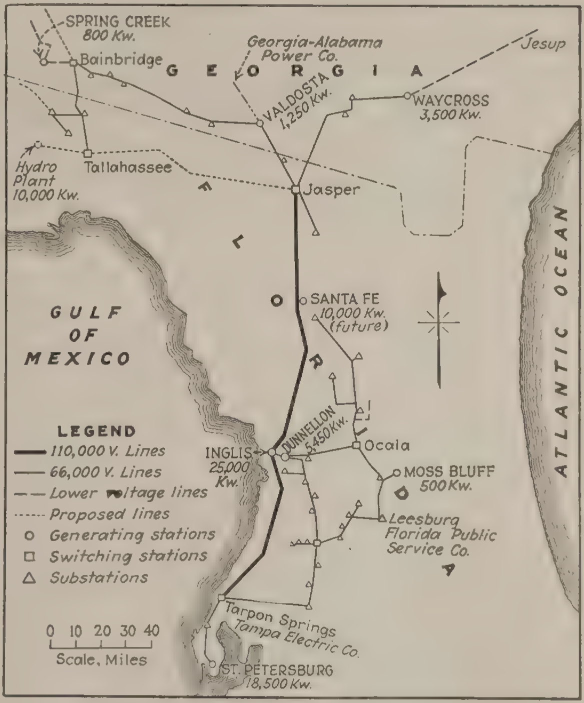
## *Used in Florida-Georgia Work*

Organization and handling of forces to speed completion of transmission lines and substations involved in expansion of National Public Service Corporation's system

By M. J. Idail* and C. E. Bland†

In the spring of 1926 the General Engineering & Management Corporation, operator and manager of the National Public Service System, entered upon a very extensive building program to meet the needs of the territory in Florida and Georgia. It had been decided that, in order to keep the standard of service in step with the increased importance of load, certain of the existing lines and substations were to be reinforced and revamped. There was additional available load in parts of the territory already served, as well as load to be had by line extensions. The company had also acquired a number of isolated, inadequate and expensively operated properties in South Georgia which had to be interconnected by a distributing transmission system, and this system in turn connected to the base power station then under construction in Florida. All of the requirements of this situation made speed of construction a paramount consideration. The demands for electric power were urgent at half a dozen places and it was necessary to start construction simultaneously at a number of widely scattered points.

Much of the line construction was through undeveloped and sparsely inhabited country. Right-of-way clearing was heavy and costly. The undeveloped nature of the country permitted the lines to be located on long tangents; there is one pole line tangent 30 miles long, and a number in excess of 10 miles, while the tower line has one tangent of 36 miles, one of 32 miles and several of 20 miles. The Tarpon Springs-Inglis section of tower line was located as close to the margin of the Gulf of Mexico as the swamp hammock would permit. Of necessity the line had to pass through a considerable amount of heavy cypress swamp. However, for a distance of 50 miles a high sandy ridge ideally suited to transmission line construction was found to parallel the coast just inside the hammock. Much of the hauling was done over the right-of-way.



*Transmission system of Florida Power Corporation, West Florida Power Company and Georgia Power & Light Company*

**The general transmission voltage is 66,000 volts. To connect the Florida and Georgia 66,000-volt system to the Inglis station the Inglis-Tarpon Springs and Inglis-Jasper 110,000-volt trunk lines were built. The company has prepared preliminary plans for a hydro-electric development on the Santa Fe River; this development will feed into the trunk line also. Contrary to general impression, the central and western part of Florida is not all flat and low; there are hills and bluffs, giving rise to possibilities of water-power development. It is interesting to note that the only water powers so far developed, or in contemplation in Florida, are a part of this system.**

The lines on the northern end of the system are for the most part built through dense turpentine woods. Florida is divided by section and range lines into sections nominally one mile square. Parts of Georgia are divided into land lots. In order satisfactorily to describe properties in the easements it was required that the lines be tied in to the section quarters and lot quarters. The labor and worry involved in making these tie-ins will be appreciated when it is realized that the original government surveys were made under the much-abused contract system around 1840 and that the pine stakes used as hubs have practically all become lost. To complicate matters further, most of the sections vary somewhat from the correct mile square.

At the start of the job a field office was opened in Ocala, Fla. A few weeks later, when both pole line and tower line work began to take on some momentum, a sub-office was opened in Thomasville, Ga. This arrangement held until the later stages, when the Ocala office was closed and the field office moved to Valdosta, Ga.

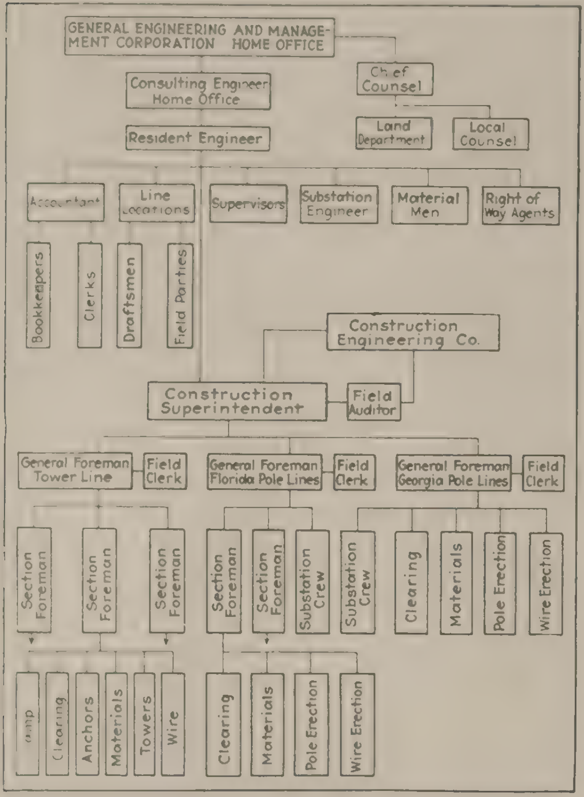
---

**Engineer with Francis R. Weller, consulting engineer, Washington, D. C.*

*†Construction manager Hoosier Engineering Company, Chicago, Ill.*

Although the operations in Georgia were several hundred miles distant from the Ocala office, the direction of all work was placed under one resident engineer and all accounting and disbursements were handled from the Ocala office. As the work progressed the wisdom of this arrangement was demonstrated; right-of-way and legal policies were kept uniform and details of accounting and engineering practice were standardized throughout the whole project.

While all right-of-way agents were directly responsible to the resident engineer in regard to progress, methods, payment, etc., the chief local counsel of the company formulated policies and passed on decisions in all matters appertaining to legalities, titles, rights, etc. In each county where work was done the chief counsel retained a local attorney to advise the right-of-way department and to handle legal processes, such as condemnation suits, etc. Fifteen attorneys were so retained.



*Engineering and construction organization chart*

The county records of title in Florida in general are in poor shape due to the many transfers and subdivisions which have taken place during the past few years. It was found necessary for the chief counsel to form a land department to clear up titles in the easements after the right-of-way department had obtained easements sufficiently good to warrant proceeding with construction. It was entirely out of the question to delay construction until titles to properties involved were completed. The land department will not have completed its work for a year or more after construction has been completed. Even making these concessions the right-of-way situation, as it always does in such rush projects, controlled and limited construction rates.

The surveys and plotting of tower line and central Florida pole lines were handled under the direction of the locating engineer from the Ocala office; similar North Florida and Georgia work was handled under the direction of the assistant locating engineer from Valdosta. The Florida and Georgia right-of-way groups were entirely independent of each other.

Three chief inspectors, or supervisors, and a substation engineer formed the contact between the resident engineer and the four construction groups; i.e., tower lines, Florida pole lines, Georgia pole lines and substations, and relieved him of all details of construction. The resident engineer had no assistant; his contact with his department heads was direct and constant. The material men were charged with the receipt, inspection and check-out of all material. The actual construction organization will be described later. Designs and specifications were prepared in the office of the consulting engineer and that office initiated purchases of equipment and material and supervised field operations and methods in considerable detail. The general scheme of the program was determined at the outset by the General Engineering & Management Corporation and the clients' staff kept in touch on all matters of importance.

### CONSTRUCTION ORGANIZATION

The field supervisory organization included: A resident engineer; one accountant and five clerks; one locating engineer, one assistant, nine field parties, two chief draftsmen and five draftsmen; two right-of-way agents and nine men; three inspectors; one substation engineer and two assistants; two material men and two warehouse men.

The project as a whole was divided into 42 jobs, each authorized by an improvement estimate. Costs of each job were kept separately and in detail. Funds were advanced to the resident engineer upon his requisition, and all except unusually large invoices were paid by the resident engineer. At the close of each job a physical inventory of the line or substation was made, the material charges on the books checked against this inventory and necessary journal entries made to cause the books to show correctly the cost of each job. When the project was nearing the close an audit was made of the freight invoices; this audit resulted in substantial refunds because of overcharges.

Unit costs are satisfactorily low on all items except the right-of-way account. The high cost of right-of-way was due to the fact that the rush basis of the project allowed but little time for "dickering," and, further, timber damage cost was high because of valuable timber tracts passed through. Right-of-way clearing cost was also rather high since very little open country was encountered. Freight charges affected costs more than is usually the case; in terms of f.o.b. factory cost, freight varied from 10 per cent of material cost, in the case of insulators and conductor, to 30 per cent in the case of poles and crossarms.

The extent of the program and the time allowed for execution, if carried out entirely by the General Engineering & Management Corporation's own forces, would have necessitated a very large expansion of engineering, supervision and construction forces and equipment for a short period. On the transmission line and substation program the corporation retained Francis R. Weller as consulting engineer in charge of engineering, designs, surveys, rights-of-way and general supervision of construction, and contracted with the Hoosier Engineering

Company for the complete erection of lines and substations. The client placed a contact engineer on the job to act as its personal representative, to expedite decisions, etc.

The accompanying chart shows the form of the construction organization. A progress schedule was prepared for each job and sizes and number of gangs were determined by the requirements of these schedules.

*Pulling logs from right-of-way with tractor (A), reel wagon that aided stringing of conductors (B) and placing anchor in hole (C)*

These schedules were altered from time to time as the relative importance of certain of the jobs changed, or as caused by right-of-way hold-ups or other difficulties. Weekly progress reports were submitted to the client; each progress report showed the work of the past week and to date and contained a statement of work laid out for the coming week.

Right-of-way clearing crews were built up from native labor, largely colored. A great many of these men were found to be skilled woodsmen. The usual clearing crew consisted of about 40 men, with a sub-foreman for about every fifteen men. The crews were organized into units, one unit clearing out underbrush, another using axes for small timber, another using crosscut saws for larger timber and a fourth crew trimming and burning brush. In the section of country where commercial timber was grown it was necessary to fell trees in a manner that would not damage other growing timber. It was also necessary in these sections to clean up brush piles thoroughly, as it is claimed insects which damage the growing timber breed in such piles.

Considerable hazard existed in burning brush, due to the possibility of fire spreading into the heavy woods; for this reason special attention was exercised by crew foremen in watching these fires. When necessary to keep a fire burning after working hours, sufficient men were left to watch it. During exceptionally dry seasons brush burning was stopped entirely.

On the high ground pine timber predominated. In Florida the pine woods had largely been cut over. In Georgia, however, many tracts of large timber were encountered. In low sections of both Georgia and Florida very heavy timber growth was encountered. These dense woods consisted of live oak, gum, palm and pine, all tied together by a dense undergrowth.

For tower line construction a standard width of clearing of 100 ft. was decided upon and for pole line construction 50 ft. was standard. All tall timber outside of this width, allowing for a five-year growth, which in falling would touch the line, was also cut. In a few instances large, substantial timber which appeared to be able to withstand high winds was left intact. All large pine timber, regardless of size, if tapped for turpentine, was cut, since experience has proved turpentined trees to be a hazard. Due to the long spans on tower line and consequent side swing of conductor in high wind additional clearing near the center of span was often necessary.

The standard type of tower anchor was the four-legged grillage. These anchors have a comparatively large bearing area to take care of poor soil compressive qualities in the swamps. The general character of the soil was a sand overburden with occasional clay outcrop. In numerous places limerock was encountered. At least 30 per cent of the anchors were installed in wet holes.

TABLE I—GENERAL FEATURES OF STANDARD 66,000-VOLT LINE CONSTRUCTION

It is quite general practice throughout Florida to use pin-type construction on 66,000-volt lines. This is no doubt due to the fact that the load density per mile of line is rather low and the economics of the problem require the cheaper pin-type construction rather than the more desirable (and more expensive) suspension design. The absence of the necessity to design for ice loading makes the comparatively long standard span quite safe. The standard span is shortened to 300-350 ft. when the line is constructed along a road, or carries two circuits. Carrier-current communication is used for load dispatching and system operation.

Cypress poles, untreated; standard length, 40 ft.
Triangular spacing of conductors, 6-ft. spacing, using pole top pin arrangement.
Creosoted pine cross-arms, 8 lb. open cell, long-leaf yellow pine.
Pin-type insulators, four-piece, cemented thimbles.
No. 1/0 A.C.S.R. conductor.
Standard span, 400 ft.
Safety Code clearances to ground.
Design loading, 11 lb. wind, no ice, 32 deg. F.
No dispatching telephone circuit.

In the sandy soil, even though dry, it was necessary to crib the sides of the excavation with planks. In wet soil it was necessary to drive sheet piling and pump the excavation. For locations with a small amount of water hand-operated diaphragm pumps were used. For anchors set in extremely wet places power-driven diaphragm pumps were used. Numerous places were encountered where eight power pumps could not keep the water down. A few instances were encountered where soil would not support the load imposed. In such cases piling was driven to firm bearing and the top of piling capped with a concrete mat, upon which the grillage anchors were installed.

Limerock in the presence of water constituted the most difficult footing condition encountered. The average limerock could be broken up with a stone sledge and small charges of dynamite. However, for a section of line just north of Inglis, Fla., a harder grade of rock was encountered. This was handled by means of an air compressor, jackhammer and dynamite.

For approximately 20 miles north of the Inglis steam plant the tower line passed through a section of the densely timbered swamp land bordering the Gulf of Mexico. Operations were started in this section in December. Due to the fear of the spring rainy season tieing up operations entirely, all hands were concentrated on this section in the endeavor to have anchors installed and material delivered by the following April. As the rainy season was late the work was well ahead by the time the heavy rains arrived.

The lower 10-ft. section of the tower was designed for use as a template in lining up and leveling the footings. The use of this arrangement prevents the anchor from sinking in toward the center of the tower and thus causing delay in erecting the superstructure. The use of the tower section as an anchor template eliminates transporting a heavy template from tower to tower; this item alone contributes a considerable saving in cost. Objection to this method is made by those who favor erecting the tower from the prone position. This objection, however, was discounted because of previous successful experience with the built-up or piece-by-piece method of tower erection. A foreman and ten men with a 1-ton truck comprised the average anchor crew.

### Tower Erection

As previously mentioned, the built-up method of tower erection was used. One great advantage of the built-up method is the small amount of equipment needed. This method limits the equipment required per crew to four handlines, six end wrenches, six socket wrenches with handle drawn out to a drift, one light gin pole with guide iron, chain, pulley and rope. The crew consists of four climbers, four groundmen, one assembler and one foreman. A truck was furnished for each two crews.

To speed up the erection of towers, a bonus system was devised whereby each member of the tower crew received an additional hour's pay for each tower erected above the minimum required. In this way excellent cooperation was obtained. Erection was facilitated by the fact that all tower pieces were well fabricated and marked. Some of the tower shipments were made by rail and water and some slight confusion was caused thereby.

The 4/0 A.C.S.R. conductor was strung out by means of a reel wagon pulled by a caterpillar tractor. The three reels were loaded on the wagon and as each tower was passed the conductor was raised to roller bearing snatch blocks suspended from the crossarms. As ends of the conductor were reached other reels were loaded on the wagon and the two ends spliced with a double sleeve joint. This method of laying out the conductor reduced the chances for abrasion to the minimum, since the conductor was not pulled over any rocks or barbed wire fences.

TABLE II—GENERAL FEATURES OF 110,000-VOLT CONSTRUCTION

It might be thought that since the lines are not designed for ice loads, comparatively small conductor sags and low towers would suffice for the desired long spans. This is not true, however, because of fear that a high day-after-day tension in the conductor would lead to vibration troubles; the sags adopted are but slightly less than those which would have been used in designing for Class B loading.

| Type A superstructure | 7,130 lb. |
| Type A anchor | 1,270 lb. |
| Total type A tower | 8,400 lb. |
| Type B superstructure | 9,600 lb. |
| Type B anchor | 4,275 lb. |
| Total type B tower | 13,875 lb. |

Two-mile sections were used in sagging in; type B towers with semi-anchor insulator assemblies were inserted at approximately 2-mile intervals, and these towers divided the line into convenient sections for sagging purposes. Dynamometers were used in giving the conductors a test pull of 3,000 lb. After the test pull the conductors were slacked off to the stringing tension of approximately 1,500 lb. The correct sag was determined by sighting in with a sag line and targets and the corresponding tension was checked by dynamometer. Specially designed Chicago grips were used to catch off the conductor. At each B tower two sets of grips were used with chain and turnbuckles to catch off between sags and to hold the test pull. After sagging was completed a small gang with a truck clamped in the insulator assemblies on the intervening suspension towers and also picked up the snatch blocks. The average wire crew comprised a foreman and twelve men with a tractor and two trucks.

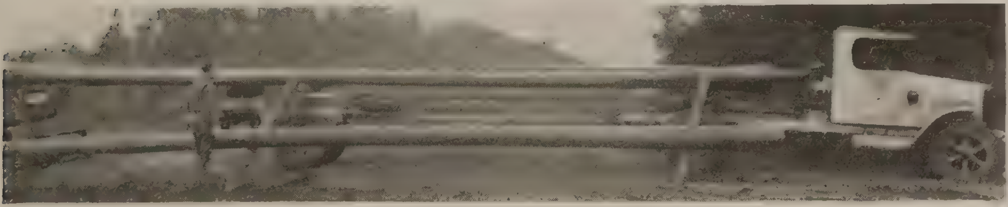
Motor trucks were used throughout the work wherever possible. In the sections not cultivated trucks often traveled the right-of-way. In low land it was necessary to use teams or tractors to place the material. In tower distribution one complete tower was hauled per trip with a 2-ton truck. For pole hauling 2-ton trucks with pneumatic-tired trailers were used. As the cypress poles were very heavy, the average load was four poles. Often poorly constructed bridges limited the loads hauled.

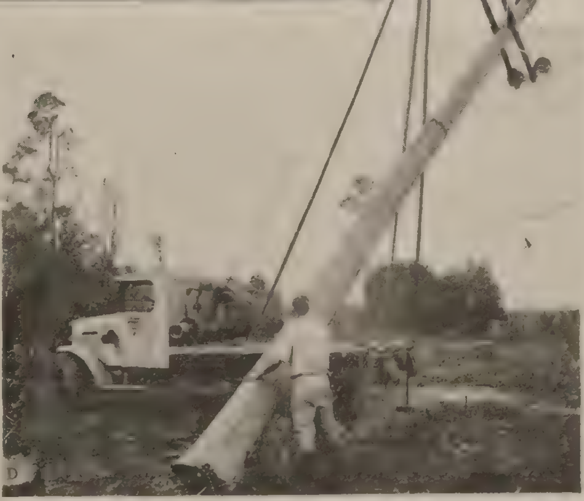
Truck depreciation was unusually high. The sandy soil was hard to pull through and was extremely hard on pneumatic tires. At the peak of the construction as many as 50 trucks, five tractors and six trailers were used on construction and material delivery. In addition, 29 passenger cars were used by the right-of-way, survey inspection and supervision forces.

On 130 miles of the tower line it was necessary to use construction camps. Each camp was designed to care for 60 men and had a camp force of one cook, two helpers and a flunky. The camps were run under the direction of the respective section foremen. Two complete camp equipments sufficed; a camp handled a section about 20 miles in length and the camps were moved as construction progressed.

Due to the presence of malarial fever it was necessary to watch sanitary conditions very closely. Each bunk tent was thoroughly screened. There was practically no sickness on the job. Each man staying in camp was charged $1.25 per day, but this fell considerably short of meeting camp operating and depreciation expenses. The camp deficit was a comparatively small portion of the total cost of the job and was cheerfully accepted as being offset by the good morale of the men.

*Pole truck and trailer (A), special transformer hauling rig (B), loading poles with truck winch (C) and pole setting equipment (D)*





The majority of the poles were set with 2-ton trucks equipped with derricks and winches. All poles were framed and cross-arms and insulators attached before raising. This method allowed the use of groundmen for this work instead of the higher priced linemen. In swampy places the poles were erected by use of a gin pole cart with team or tractor.

A large number of wet holes were encountered in the loose, sandy soil and hole digging under such conditions was quite a troublesome and expensive job. Great success was had in setting these poles with dynamite; i.e., "shooting them in." The method is as follows: First, a 2-in. pipe is driven into the ground to approximately the depth to which it is desired to set the pole. The dirt inside the pipe is then augered or bailed out, after which a charge of 40 per cent dynamite, usually about two sticks, depending on the texture of the soil, is inserted. The pipe is then pulled out, leaving the charge about 6 to 7 ft. in the ground, and the pole is erected directly over the charge and guyed with hand-lines, or if it is a light pole, the workmen can hold the pole erect with pike poles. The charge is then exploded, opening a cavity and allowing the pole to drop to position, after which the soil falls back around the pole. It is usually necessary to use some additional backfill, but not as much as might be imagined. The cavity is not much greater in diameter than that of the pole itself and the force of the explosion seems to be largely upward. Sometimes a shot that is too heavy will shatter a part of the pole. This method works to perfection in sandy soil and can be used in clay soil, although not so successfully, since preliminary shots are required to loosen up the soil.

A number of unusual and interesting problems were encountered in building the pole lines. For about 20 miles one line was built parallel to an old logging railroad and 25 ft. from its center line. A small locomotive and several flat cars were rented and a gas engine derrick was built on one of the flat cars. Poles, cross-arms, insulators and hardware were first delivered and then pole erection was started. It was necessary to shoot in most of the poles. Two crews were used; one, with the derrick, stood the poles up and guyed them, and the other gang followed, shooting and removing the guy lines. The conductor was pulled out from a reel wagon mounted on a flat car.

Another interesting job, described in the ELECTRICAL WORLD, April 30, 1927, was the erection of a 2-mile section of line across a swamp in which the water varied in depth from 2 ft. to 6 ft. The poles were set up by means of a derrick built on an old barge and then shot in. Each pole was side guyed with screw-type anchors to insure permanent stability.

The rates of progress varied considerably on the various jobs. The organization was planned and equipment mobilized in anticipation of a schedule considerably faster than that actually realized. Even though the speed of construction be considered more important than keeping costs to a minimum, practically, the limit is soon reached. Property owners will not be rushed into giving easements; to attempt to do so simply results in sending prices sky high. Legal processes take time and lots of it. The workmen were frequently reminded of the importance of avoiding unnecessary crop and fence damage and of getting on well with the people in general. Very little trouble occurred in this connection.

*Installing anchors in swamp under difficult conditions*

### SUBSTATION ERECTION

Substation gangs were organized apart from the pole-line crews, as many as six gangs being used on the project. A great many temporary installations were made to provide service during reconstruction. On the larger stations the crews were divided into units, such as foundation crew, steel and equipment erection crew and electrical crew for switchboard and wiring work.

Prior to the 1926-1927 program the transmission system comprised approximately 260 miles of 66,000-volt line and 90 miles of 44,000-volt and 22,000-volt construction. At the completion of the program the 66,000-volt lines will have increased to more than 730 miles, and 178 miles of 110,000-volt trunk line connecting the Florida and Georgia systems will have been built. The 66,000-volt substations will have increased in number from 22 to 45. Sixteen small, over-loaded, uneconomical generating plants will have been shut down. In addition to the transmission work here described, the distribution systems in St. Petersburg, Clearwater and Tarpon Springs were entirely rebuilt and a 25,000-kw. oil-burning generating station constructed at Inglis, Fla. The Inglis station was designed and constructed by the General Engineering & Management Corporation's own forces. A 10,000-kw. (ultimate capacity) hydro-electric development is under construction at Jackson's Bluff, near Tallahassee, the state capital of Florida, and will be tied in with this development.

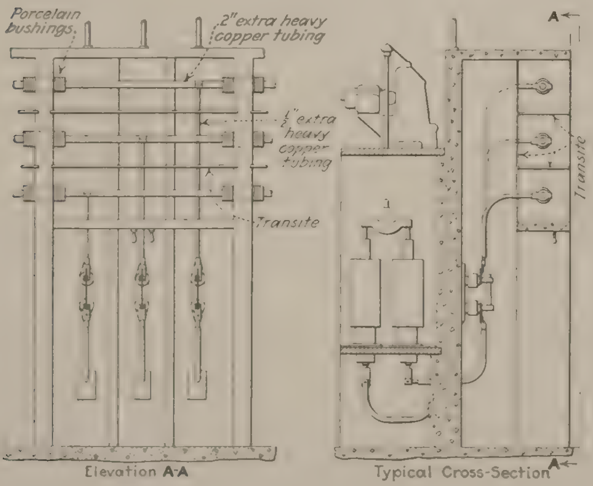
Experience on a project of this size brings out very forcibly the advantages and necessities of certain arrangements which on smaller projects are equally important but may not stand out so strongly. The accounting system must be such that money will be available for the prompt payment of invoices. There must be a sufficient number of bookkeepers and office men to keep the books properly and in detail; incorrect entries must be corrected by journal entries as soon as discovered, even though there may tend to be a multiplicity of journal entries.

Ample, if not even an excess, construction equipment is a necessity on a rush job; this is particularly true in the case of trucks. The importance of the position of chief of the party on line location is often underestimated. It pays to employ a high type of experienced man for this work.

The entire transmission project was under the direction of H. D. Panton as resident engineer for Francis R. Weller. The General Engineering & Management Corporation gave general supervision to the project. Admirable co-operation between the client's operating departments and the engineer's and contractor's forces contributed much to the satisfactory handling of the project.

## Porcelain Bushings Support Tubular Bus

IN USING tubular copper bus in several of its substations the Portland (Ore.) Electric Power Company has developed the type of support shown. Porcelain bushings, through which 2-in. extra-heavy copper tubing passes, are cemented into the cell barriers. This type of support requires a minimum number of insulators and has ample strength for taking care of very heavy short-circuit stresses. A cushion is obtained for the tubular bus by inserting packing around the tubing where it passes through the supporting insulator.



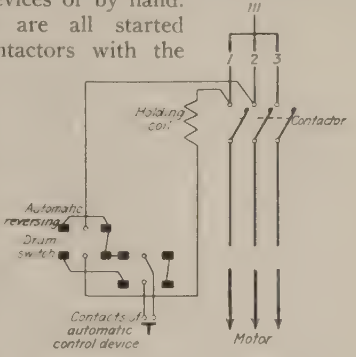
*Bus structure supported by barrier bushings in substation*

# Reversing Drum Switch Transfers Motor Control

By C. B. Carpenter
*Engineering Department, Washington Water Power Company, Spokane, Wash.*

A SIMPLE and reliable method of transferring control of motors from automatic to hand control is often desired in the case of pumps, blowers and other machines controlled by automatic devices, such as float or pressure switches. Such a device should be simple and rugged and should permit the motor to be operated independently of the control device, under control of the device or stopped and made non-automatic, as may be desired by the operator.

At the Chelan hydro-electric plant of the Washington Water Power Company there are five pumps controlled either by automatic devices or by hand. The driving motors are all started by across-the-line contactors with the control device connected in the circuit to the holding coil of the contactor. The device used for this purpose is a reversing drum switch of standard manufacture suitable for small motors on circuits up to 600 volts. Its cost is about the same as a push-button station which will perform a similar function on a 440-volt circuit. The contacts in the switch are rugged and have ample carrying capacity for any contactor coil circuit that may be utilized.



III

Automatic reversing Drum switch
Contacts of automatic control device
Motor

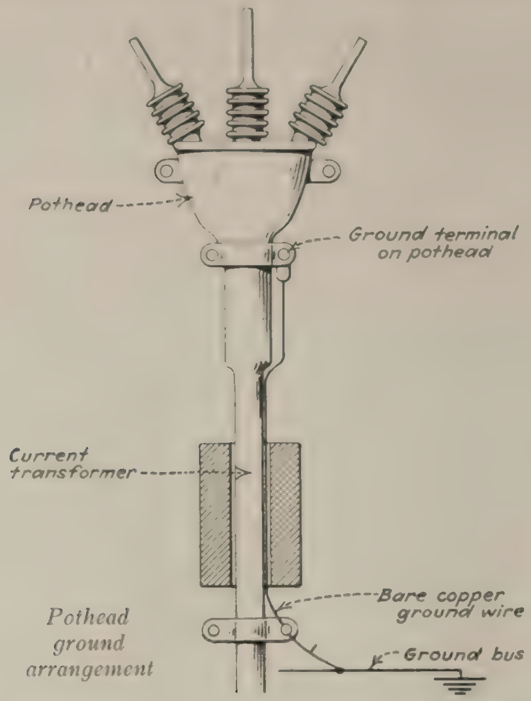
*Connections for reversing drum switch adapted to transferring motor control from hand to automatic operation*

When the reversing switch is connected as shown in the accompanying diagram and is in the off position, the control circuit is open and the motor is off. When thrown to one side the contactor coil circuit is connected in series with the contacts of the float switch or other automatic device and the motor is subject to the control of that device. If the switch is thrown to the opposite position, the contactor or control circuit is closed and the motor will run independently of the position of the contacts in the automatic control device. In the case of small direct-current motors the main line of the motor can be controlled by the drum switch. The drum switch is so small that it can be mounted at any convenient point. At Chelan the switches are mounted on the motor frames, affording unit construction.

With its positions marked "Run," "Off" and "Automatic" the operation of the switch is almost self-evident, whereas if push-button stations were used for the same service the operation would neither be so simple nor reliable. It was found in the case of a 440-volt circuit that the small reversing drum switch cost only half as much as two push-button stations that would have been required to perform the same function. Moreover, tampering with the automatic control device is avoided in case it is desired to operate the machinery irrespective of the position of the control device.

## Cable Pothead Protection

FROM F. B. Haugaard of the Electricity Department, Sydney, Australia, comes a note of comment on a short article entitled "Place to Ground Cable Sheaths" and published in the ELECTRICAL WORLD, April 23, 1927.



*Pothead ground arrangement*

Mr. Haugaard points out the desirability of a ground connection at the pothead itself, on account of the fact that "a considerable percentage of failures occur in potheads." As a means to prevent ground return currents in the cable sheath from setting up a flow in the secondary of the transformer and also to provide a ground connection at the pothead, he presents the arrangement shown in the accompanying sketch. In this, the ground wire attached to the pothead is brought back alongside the cable sheath through the current transformer opening, is clamped to the sheath below the transformer and goes to ground. The bolts supporting the potheads are insulated with fiber bushings and washers in order to assure the complete return of sheath currents along the ground wire and back through the current transformer. The ground return current in the sheath is thus balanced by the current in the ground wire and no flow is set up in the secondary of the transformer.

## Generator Rating Close to 30,000,000 Kva.

AN INSTALLED capacity of 29,629,000 kva., operated by 2,806 companies and municipalities, while 1,644 additional systems use purchased energy exclusively, constitutes the generating equipment in public utility electric light and power plants in the United States (not including Muscle Shoals) at the beginning of 1928.

Of the 4,450 systems in all, 2,477 are commercial and 1,973 municipal, though the total generator equipment in the latter is relatively small.

The figures here presented are the result of a comprehensive and critical recheck by the ELECTRICAL WORLD of data from all available sources of information, including some material not obtainable until very recently.

The revision shows a slight increase in rating, confined to no particular section of the country, over the previous determination as of the end of 1927. A few additional operating companies have also come to light.

Particular care has been taken properly to allocate the plants of companies operating in more than one state, though operations are reported from one central office.

*Number of Central Station Operating Systems and Installed Generator Rating, Jan. 1, 1928*

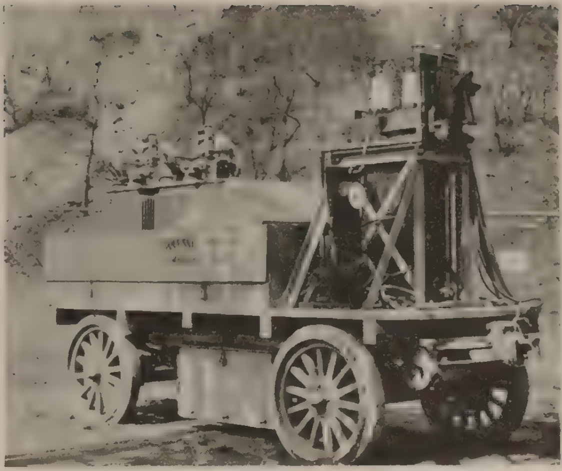
# Field Testing of Relays

By W. M. Evans and R. J. Salsbury
*Duquesne Light Company, Pittsburgh, Pa.*



*Outfit for 22-kv. tests, mounted on a trailer*

IN April and May, 1927, 443 grounds were applied to the Duquesne Light Company system, in order to check relay operation. There was one failure of service at 2 a.m., no failures of equipment and no injury to personnel.

The relay protection of a pure radial transmission system is comparatively simple. As the transmission layout becomes more complicated and grows into a network, the relay problem also grows with a degree of complexity which is much more rapid.

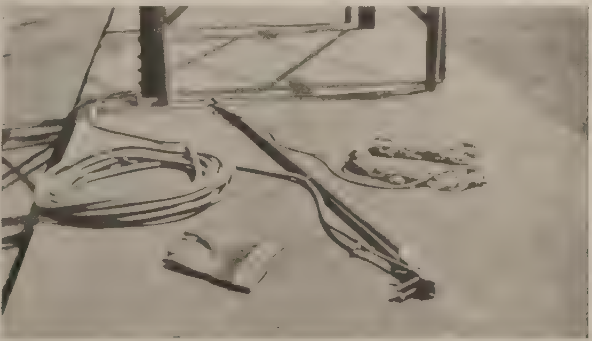
The testing of these relays and the wiring check-up in the field is very complicated, due to the location of many customers on the loops, to the power factor of the current on many lines, and to the regulation. It was not possible, except in a very few cases, to obtain the flow of power whose direction and stability are sufficiently determined to make an accurate phantom and polarity check. Some of the wiring combinations were quite involved, so that it was possible that wrong connections had crept in. Therefore, it was determined to make absolutely certain as to the performance of the relays by actually putting a ground on the system and permitting it to be cleared as under service conditions. This procedure has several advantages:

1. The mechanical and electrical operation of the breakers, otherwise dormant, is secured.
2. There is no doubt as to where the fault occurred when the breaker operations are analyzed in connection with these tests.
3. Observers at related points can secure reliable information that is otherwise lost under service conditions.
4. Knowing where the ground is placed permits the making of breakers non-automatic where imperfect conditions are suspected, and the relay operation can be observed without actually trying the circuit breakers.
5. Positive information as to the correctness of installation is secured.
6. Information as to the operation of oil circuit-breakers under service conditions is obtained.
7. The time selection between the various customers' loops can be observed. It should be noted that this time selection check included all the factors concerned in obtaining selection between stations.
8. Training in complicated switching operations is secured.

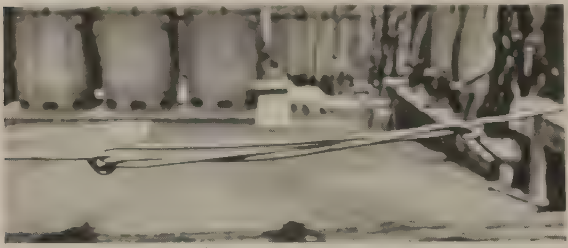
### High-Voltage Tests Simpler

The experience obtained during these tests proved invaluable. The tests made on the 66-kv. lines differ somewhat from those conducted on the 22-kv. lines, being much simpler on the higher voltage. A piece of rubber-covered wire with clamps, hook stick and ground rod and the necessary measuring instruments and the observers were all that were required.

The ground lead is connected by a clamp on the end of the live line connector. The lead is taped part way out on the stick to make it swing free of the circuit breaker. The end of the stick is strained to a steel tower with a rope. This also assists in keeping the lead free of the circuit breaker. The station ground is used as a ground point. When the circuit breaker illustrated is closed, it will apply a ground to the line which will be cleared at the adjacent station, since the ground



*Equipment used for 66-kv. line relay tests and close-up view of 66-kv. grounding material utilized in these determinations* is connected to the bus side of the circuit breaker. In order successfully to apply ground to a 22-kv. network an old circuit breaker was necessary. Had it not been used, it would have been necessary to remove equipment from service and open customers' loops so that service conditions would not have been properly simulated. Hence, this breaker, together with the control battery and the miscellaneous tools and wiring, was mounted on a trailer and transported from place to place, where it was desired to install the ground connections. In this manner 293 grounds were applied to the 22-kv. system and all 22-kv. breakers checked for relay operation. Where it was not possible to permit the breaker to open because of service requirements, a lamp was placed in series with the trip coil and its operation observed.



*Method of taking up slack in a grounding lead to keep it free of the ground*

In the 22-kv. tests it will be noted that there are two low-voltage regulators used for high-current tests on current transformers. In the center of the trailer is a tool box which contains the necessary insulators, rope and miscellaneous auxiliary test equipment. On the other end of the trailer the 22-kv. circuit breaker is mounted. The storage battery is mounted under the trailer in a compartment.

### VALUABLE RESULTS OBTAINED

Valuable operating data were secured from these tests. After the tests were concluded, it was definitely known that the polarity of all ground relays and phase relays was correct. The mechanical and electrical features of the oil circuit breakers were given a thorough trial and it was definitely determined that they had been given adequate maintenance. In addition to the operating data obtained, certain inherent characteristics of design both in transmission layout and relay scheme applications were discovered. These characteristics were of sufficient importance to cause a change in the future plans for high-tension transmission rearrangements.

The greatest amount of satisfaction was secured from the ease with which these tests had been performed, particularly on the higher voltage. It was discovered to be a simple matter to apply the ground wire on the oil circuit breaker between the bushings and open disconnect, then to close the breaker and take readings. In view of the ease of testing relays and relay schemes, and in view of the benefit derived from this method, it is planned in future to check all new installations before they are cut into service. Also, a periodic check will be made on the entire system probably once every two years, and all questionable operations will be investigated by applying actual grounds to the assumed fault which caused the doubtful operation.

---

## Illumination from Invisible Sources of Ultra-Violet Light

SOME unusual illuminating effects have been produced by using ultra-violet light to cause luminescence of objects and surfaces. For example, at the last convention of the Associated Edison Illuminating Companies figures of animals, balloons, dishes, fish, flowers and water in large pools were made to glow red, pink, yellow, green and blue in apparent darkness by the ultra-violet stimulation of chemical coatings. In addition experiments have been reported in which attempts have been made to produce subdued lighting effects, such as are needed in auditoriums, theaters, etc., to permit seating or exit without disturbing performances.

The popular demonstration of this interesting application of ultra-violet light was made under the supervision of L. C. Porter of the Edison Lamp Works. He reports that powerful searchlamps were used for the purpose, equipped with quartz-tube mercury-arc lamps. These sources of invisible radiation were used because they generate a much higher percentage of ultra-violet light than do ordinary forms of illuminants. Aluminum reflectors were employed because the ordinary silvered surface reflector, which reflects about 95 per cent of visible light, would reflect only about 15 per cent of ultra-violet radiation. The polished aluminum reflectors reflect about 45 per cent of the ultra-violet radiation.

To provide illumination of different colors chemical coatings of zinc sulphide, anthracene, fluorescein, rhodamine, eosin, etc., have been employed. Such chemicals absorb the short invisible ultra-violet radiations and convert them into longer visible radiations which become apparent as light. Some of the chemicals will glow only while they are being stimulated. Others will continue to glow for a little while after the ultra-violet stimulation ceases.

# Industrial Power Interchange

Economical utilization of byproduct power can be worked out jointly by power and manufacturing industries to conserve the energy that is now wasted in many manufacturing plant processes

*An Interview With*

T. O. KENNEDY

*Vice-President and General Manager Ohio Public Service Company, Cleveland, Ohio*

*T. O. Kennedy*

POWER companies in their service to industry are meeting with an important economic problem which resolves itself frequently into both the sale of electric energy to and its purchase from the same industrial customer. This condition may be found most often in highly industrialized areas, but may occur in any territory served by electric utilities. That an arrangement for the sale and exchange of power between the utility and the industrial plant can be worked out on a mutually profitable basis has been shown in the experience of T. O. Kennedy, vice-president and general manager of the Ohio Public Service Company, under whose direction this company has been exchanging power with two of its large customers for some time. As this practice opens up large possibilities for the further electrification of industry and development of the sale of power by the central-station companies, Mr. Kennedy has been asked to outline the principles of such an arrangement. The philosophy and economics of the problem as regards industrial and utility problems have been stated by Mr. Kennedy as follows:

"There is a mutuality of interest between the manufacturing industry and the public utility industry.

"The payroll of the manufacturer supports the community and a part of this payroll naturally goes to pay for utility service. The public utility companies serving the communities are, therefore, vitally interested in the continuing success of the manufacturer, even though they may not sell him service.

"The manufacturer is also directly concerned in the prosperity of the utility companies whether or not he buys their service for his manufacturing processes. His successful operations depend, in a large measure, upon the living conditions provided by the community for his employees, and these living conditions are of course largely influenced by the utility service available for their use and convenience.

"In the conduct of some manufacturing businesses byproducts are produced representing energy in some form such as waste heat, coke, wood waste, coke-oven and blast furnace gas, etc.

"In the interest of the stockholders and in the interest of the community, these byproducts must be utilized to produce the greatest economic return possible, and because of the interdependence between the manufacturer and the utilities such utilization of these by-products becomes a mutual problem.

"Assuming that the above premise is accepted by the managements of the manufacturing company and the utilities, the first step in the solution of a byproduct situation is to canvass all possible uses for the byproduct in question carefully.

"The production of power through the use of byproduct fuel is probably the most uneconomic use to which such byproducts could be put. This is true because of the many important items of power cost, aside from the bare cost of fuel and also because of the low fuel prices against which the byproduct fuel must be evaluated.

"Therefore, every effort should be made to discover a more economic use for the byproduct, such as, for instance, for industrial heat processes, especially when the byproduct is in the form of gas and where the opportunity exists for such application. Probably the most valuable use to which coke-oven gas can be put is its distribution to domestic consumers through the mains of the public utility supplying gas service to the community in which the plant is located.

"There are many instances, however, in which the only use for byproduct energy is the production of power, and it is in such instances that the importance of cooperation between the manufacturer and the electric utility is emphasized.

"In general, there are two ways in which to consider the utilization of byproduct fuel for power production: (1) The installation of equipment designed for operation only when byproduct fuel is available and to utilize all such fuel. (2) The installation of equipment in sufficient capacity and number of units, equipped with auxiliary fuel-burning apparatus, so that a reliable and adequate supply of power can be produced at all times, whether or not byproduct fuel is available.

"In the second case the investment is very much greater than is necessary for the first method and, in addition, a wastage of byproduct fuel almost always results, because power requirements are at times insufficient to utilize all the byproduct fuel available.

"Plan No. 1 can only be followed by maintaining a connection with the lines of the electric utility on a basis permitting the taking of power from, or delivering power to, the utility system, depending upon the amount of byproduct power produced being less or greater than the total power requirements of the manufacturer.

"A comparison of the two plans in any particular instance narrows down to a study of the economics of power production by the utility and by the manufacturer with purchased fuel, and then superimposing upon the result of this study the greater relative value of the power produced by byproduct fuel when a connection is maintained with the electric utility.

### Production Cost Advantages

"Most electric utilities today take advantage of many conditions contributing to lower total cost of power production which are not available to the individual manufacturer operating his own generating plant, such as:

"1. Location of plant adjacent to fuel and condensing water supply.

"2. Increased efficiency due to maximum size of units, use of high steam pressure and temperature.

"3. Decreased investment per unit of capacity by reason of interconnection of transmission systems, thus decreasing investment for reserve.

"4. Diversity of load resulting in high load factor on generating stations.

"5. Large station capacity justifies technical ability in operating force, insuring maximum efficiency of operations.

"It would indeed be a very unusual situation where a mutually advantageous interconnection contract could not be formulated between the electric utility and a manufacturer who produces byproduct fuel for which no better use could be found than power production.

"In this connection it is important that consideration be given to possible future developments in the industrial field. Due to the increasing use of electricity for power and heating processes, the manufacturer usually can anticipate a constant increase in his power requirements. On the other hand, it may reasonably be expected that the production of byproduct fuel will decrease as improved processes are developed, such as the direct production of iron from ore without the use of the blast furnace.

### Economies in Steel Industry

"Many manufacturers, particularly in the steel industry, are today utilizing their byproducts very uneconomically, because, at the time they installed their power-producing equipment, they had waste fuel largely in excess of their power requirements and little attention was given to the efficiency of its utilization. Now, with greatly increased power requirements, they are burning purchased fuel during normal operating periods and are letting byproducts go to waste several hours every day and all day on Sundays and holidays.

"In 1922 a blast furnace company in our territory completed the installation of a 600-ton blast furnace and installed one 6,000 and two 1,000-kw. turbo-generators, using steam from boilers fired with blast furnace gas as fuel. Some of the boilers are also equipped for burning coal as an auxiliary fuel. Our company entered into an agreement with the furnace company to purchase all the power so generated in excess of that required to operate the furnace and its equipment. This contract was dated March, 1922, and the rate was based on the generating cost at our nearest plant for each month during the life of the contract.

"A steel company located adjacent to the furnace company, and under joint ownership, purchases at our regular filed rates all power for the operation of its plant, having a demand of approximately 20,000 kw.

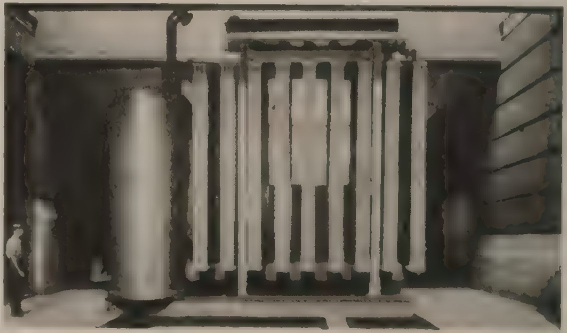
"In 1925 another steel company, at a different location, completed the installation of a 600-ton blast furnace and installed one 10,000-kw. turbo-generator, operating on steam produced from boilers fired by blast furnace gas, with auxiliary equipment for burning powdered coal. We entered into an agreement in May, 1925, to purchase all of the electric power generated by the 10,000-kw. turbine in excess of the requirements of the blast furnace and steel mill and to pay for such energy a flat rate per kilowatt-hour, which is practically equivalent to the generating cost in our system.

"The latter steel company has a total power demand of approximately 15,000 kw. and contracted to purchase at our filed rate all power required in excess of that generated by its own 10,000-kw. turbine.

"The relations between these two steel companies and our company are apparently satisfactory, and while I could not go so far as to say that the arrangements conform strictly to the ideals set up here, I believe that we have made a good start toward the working out of such an economic arrangement.

"The manufacturing industry and the utility industry have everything to gain and nothing to lose in putting all their cards on the table and working out the right solution to this problem of byproduct utilization in every instance."

## Transformer Radiator Mounting That Saves Space

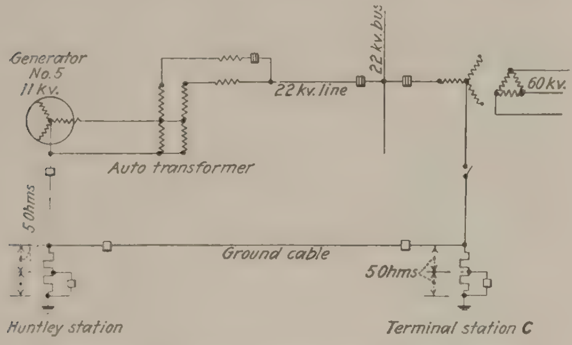


SPACE limitations in a station of the Brooklyn Edison Company required that the oil-cooling radiators for the generator auto-transformers be mounted as shown. The radiators are arranged face to face in a row, with manifolds connecting the upper and lower openings with the transformer tank. The conservator, mounted above the cooling units, is piped to the radiator furthest from the main tank. These 29,667-kva., single-phase, 13,800/27,600-volt transformers are direct connected to the generators.

# New Buffalo Unit Feeds 22-Kv. System Directly

By Cromwell MacIntosh
*Assistant Electrical Engineer Buffalo General Electric Company, Buffalo, N. Y.*

IN PLANNING the addition of a block of 60,000 kw. to the distributing system, consideration was given to the fact that the 11,000-volt system was shrinking as the 22,000-volt system enlarged. It was, therefore, determined that the new turbo-generator should feed the 22,000-volt system directly. Accordingly the generator was designed for operation in conjunction with a three-phase auto-transformer, rated 66,667 kva., 12,000 to 22,500 volts, 25 cycles. This transformer was constructed in a single unit and is one of the largest capacity transformers ever built. The low-tension winding is solidly connected to the generator terminals without switches of any kind and the high-tension windings feed directly into a 1,250,000-circ.mil line extending to terminal station "C," making connection through circuit breakers and disconnecting switches to the duplicate 22,000-volt buses of that station.



*Generator is direct-connected to 22-kv. system through auto-transformers*

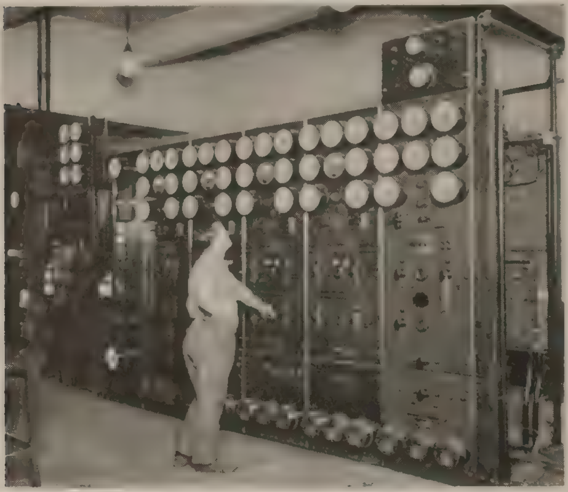
The addition of so large a unit to the sources of energy already connected to the 22,000-volt distributing system, centered at terminal station "C," very materially increased the calculated short-circuit strains upon the system, and a means had to be devised to keep these strains within short-circuit ratings of the equipment already in service. To accomplish this end the auto-transformer was designed with two parallel windings permanently connected together at the neutral and at the 12,000-volt taps. One set of 22,500-volt terminals connects through 5 per cent reactors directly to the tie line. The other set of 22,500 terminals connects through similar reactors and an oil circuit breaker to the same line. The oil circuit breaker, known as the "reactance breaker," is operated by instantaneous overload relays set to trip when the generator output exceeds 300 per cent of its rated current. With both windings connected the auto-transformer has an impedance of 3.8 per cent on 66,667 kva. When the reactance breaker trips and thereby disconnects one high-tension winding in each phase, the impedance of the auto-transformer is changed to approximately 18 per cent on the same capacity. This large increase in impedance comes into the circuit before any circuit breakers have tripped at terminal station "C," with the exception of a bus junction breaker, which has ample rupturing capacity. When the reactance breaker opens it leaves generator No. 5 synchronized with the load, and as soon as the initial disturbance has passed the operator at the Huntley generating station recloses the reactance breaker.

In the 40,000-kva. tie between the 11,000-volt system and the 22,000-volt system a similar reactance breaker has been installed, which disconnects the high-tension winding of one of the two 20,000-kva., three-phase transformers, operating in parallel. The effect of this reactance breaker, therefore, is to double the impedance of the tie from its value of 10 per cent as computed on a 40,000-kva. basis.

With respect to metering and protection, generator No. 5 is considered to include its auto-transformer, located just outside of the west wall of the station, its reactors and reactance breaker, tie line and switching equipment at terminal station "C," through which it is connected to the load bus. All of this equipment is protected by induction relays served by differentially connected current transformers installed in the neutral lines at the generator and in the conductors between circuit breakers and load bus at terminal station "C." Connected to the 12,000-volt generator terminals is a feeder for supplying house service. Since this connects within the zone protected by differential current transformers and relays, it is necessary to compensate for any current taken. Consequently, it has current transformers connected in parallel with those of the main tie line In addition to the differential protection just described, the output

*66,667-kva. auto-transformer, power-limiting reactors and 20,000-kva. transformers* of the generator is controlled by overload induction relays located at the terminal station.

The 22,000-volt distribution system is equipped throughout with induction relays of the usual kind and with ground or neutral relays arranged to trip instantaneously on ground current. Relay settings are calculated on the basis of a maximum ground current of 2,540 amp., which is the current that will flow through a 5-ohm ground resistor, connected to the neutral point of a 22,000-volt system, when one phase is dead grounded. In order to insure correct functioning of these neutral relays, the system ground must have a value of 5 ohms at all times, whether or not the generator is connected to the load. Consequently, an independent ground resistor could not be used. The scheme adopted uses two 10-ohm grounding resistors, one at the terminal station "C" and one at the Huntley station. These are independently connected to earth, and the ungrounded terminals of the two resistors, therefore, operate in parallel, having the effect of a 5-ohm resistor, connected to the system at all times.



*Generator control panels, generator-transformer unit on right*

## New Station Uses 1,350 Lb. Steam

STEAM will be generated at 1,350 lb. per square inch pressure in the new Deepwater (N. J.) station, owned jointly by the American Gas & Electric Company and the United Gas Improvement Company. The Babcock & Wilcox Company supplied the four standard and two reheat 1,350-lb. pressure boilers. The standard boilers with steaming economizer and air preheater will produce 331,000 lb. of steam per hour at 725 deg. F. The reheat boilers will deliver 290,000 lb. of steam per hour and will reheat 419,000 lb. of steam to 775 deg. F.

Generating equipment, as reported on page 476 of the ELECTRICAL WORLD for March 3, 1928, will consist of an initial capacity of 118,500 kw., the entire steam demand being supplied by the high-pressure boilers. Operating pressures will be 1,200 lb. per square inch at 725 deg. F. total temperature. This plant will also supply process steam to the adjacent plant of E. I. du Pont de Nemours & Company, Inc. The design and construction of the new plant is under the supervision of Stevens & Wood, New York.

## Seaplane Aids Line Right-of-Way Survey

IN SURVEYING the right-of-way for its 200-mile, 220,000-volt transmission line from the Ottawa River to Toronto, the Ontario Hydro-Electric Power Commission used a speedy seaplane. The aerial survey was adopted, in preference to a preliminary field survey, because it was considered cheaper and quicker, and more readily assured the best possible location of line. The eastern 120 miles of line passes through rough, undrained lake districts. A straight, short, easily constructed line avoiding villages, farms, buildings and orchards was desired for the western 80 miles.

The first procedure was to project and locate the general route. Practically the only maps available were the township maps and the standard government topographical maps. These were found to be unreliable in detail. Instances were noted, through the aerial survey, where lakes were half a mile from their map location. Many lakes were not mapped at all and roads indicated on the map did not exist. Without accurate information regarding the physical obstructions existing along the 120 miles of rough and isolated bush country the work of any survey parties put in the field would have been slow and expensive, involving general triangulation with traverses to locate obstructions and the running of trial lines.

A seaplane, equipped with pontoons, and having a flying speed of 100 miles an hour, was engaged through an aerial survey company. On the eastern section of the line, and as far west as Rice Lake, there are lakes within gliding distance of the center line, but from Rice Lake to Toronto there are few suitable landing places for a seaplane, and as the machine did not carry sufficient gasoline for a flight to the company's Ottawa River base from Toronto after a photographic flight, a base was established near the center of the route.

The survey company was provided with a copy of the government map showing the projected center line and two sets of oblique photos were taken, one from either side. These obliques were used to locate or revise the line with sufficient finality to allow vertical photographs to be taken over the final location. The latter were made at a height of approximately 6,000 ft. over what was fixed as the approximate final location of the line and were then matched into mosaic strips about 22 in. long, showing in great detail a strip of country averaging some 1¼ miles in width.

According to A. P. Goodwin of Toronto, engineer of the Hydro-Electric Power Commission transmission department, the use of these pictures has practically eliminated expensive preliminary field surveys and the work of line location has been facilitated. Small hilltops, ridges and gullies washed by rainstorms can be discerned without difficulty.

By the use of aerial maps the commission's right-of-way agents have been able to go out into the fields and secure options or easements without any preliminary field work. It has been possible to show clearly to the various owners the location of the proposed line without going out and tramping all over the fields.

The only work for the field parties, according to Mr. Goodwin, was the location of the line on the ground as indicated on the photographs, the running of a profile along the center line, noting property ties and ownership of land passed over and the staking of the tower sites.

# Five Years of Stock Dividends

Method adopted in 1923 proves beneficial both to shareholder and to the company. Comparison with issue of rights and financial results of the two policies over a period

By FRANK L. DAME
*President of the North American Company*

*Frank L. Dame*

OUR policy of paying dividends exclusively in stock during the past five years has demonstrated in a rather conclusive manner that such a policy is both practical and advantageous. That the benefits are enjoyed both by the shareholders and by the company has been proved by the experience of this company and by the indorsement of investors in every part of the country.

Many articles have been published within the last two or three years on the subject of stock dividends. Such articles usually express the academic viewpoint that the stockholder retains the same interest in a company or corporation that he had before the issue of such dividends. Sustaining this view, the United States Supreme Court has held that such dividends are exempt from the income tax. Aside entirely from the legal aspects of the question, I am greatly impressed by the facts established by actual experience with stock dividends during the period since 1923.

While there is a wide variation in practice in the payment of stock dividends, I shall refer here only to those dividends which are declared regularly and in the place of cash dividends. As already intimated, common stock dividends of the North American Company have been paid entirely in common stock since 1923. I am not familiar with any other company following this procedure, although in some cases an option is granted between the payment of cash or stock.

### ADVANTAGES OF STOCK DIVIDENDS

There are certain outstanding advantages of the policy of paying stock dividends. It provides a not too costly method of financing, which is not especially burdensome to the stockholder, to meet the demands of steady expansion, and is especially adaptable to the public utility industry. Furthermore, payment of stock dividends provides a satisfactory return to the shareholder—maintaining his proportionate interest in case he holds his dividend stock, or, in case he sells the stock, the equity in a growing and stronger concern is safeguarded. The policy also enables the shareholder to choose between cash and investment, the former by immediately cashing his stock dividend, which is readily marketable without loss except the relinquishment of potential profits, the latter by keeping his stock dividend and retaining his proportionate interest with potential profits. The second option is the retirement of dividends and interest. The stockholder can do this without the payment of additional funds, a course which so often is necessary in exercising rights to subscribe to stock. In brief, the stock dividend facilitates an increase in investment holdings without imposing additional financial burdens on the stockholder. His interests are completely protected in the interval, while he has the option of automatic reinvestment or a payment in cash.

The charge that the stock dividend is a means of tax evasion is obviously unfounded, since the company paying such dividends receives no immunity. The North American Company has adopted the stock dividend policy since it automatically makes available a fair part of the company's necessary investment funds for subsidiary development without adding an undue burden to shareholders. For taxation purposes the government recognizes original cost and stock dividends bring down the average. If the dividend is marketed, any profit over the average cost is taxable to the individual. It is essential for the holding company to increase its investments in the equity stocks of its subsidiaries in order to maintain a balanced capital set-up which will enable the parent company as well as its subsidiaries to secure money from the sale of preferred stocks and bonds at the most satisfactory rate; particularly is this the case in the public utility industry in view of its exceedingly rapid growth, doubling as it does on the average about every five years. The stock dividend of this company, namely 10 per cent, requires about seven years to double.

The strengthening of the financial set-up of the North American Company since its adoption of the stock dividend policy five years ago is evident. The dividends issued have not increased the common stock outstanding in proportion to the total consolidated capitalization. In fact, there has been an actual decrease. Furthermore, common stock during the period March 31, 1923, to Dec. 31, 1927, increased 66.6 per cent from stock dividends and 33.6 per cent from the issue of stock for cash and for properties, making a total increase of 100.2 per cent.

Meanwhile the consolidated net income, which is the amount available for common stock dividends and surplus, increased 158 per cent, or more than 1½ times the total increase in common stock.

A comparison of the stock dividend policy with the issue of rights to stockholders from time to time to subscribe for additional stock, usually at par, is interesting. The regular payment of stock dividends is virtually the equivalent of combining cash dividends with subscription rights; the former, however, gives the stockholder more frequent and convenient subscription privileges. The investor who is so situated financially that he cannot subscribe for 10, 15 or 25 per cent of his holdings, as the offering may be, sells his rights willingly and counts the proceeds of the sale in addition to his cash dividend as his yield from the investment. Investors frequently seek stocks on which rights may be expected regularly in order that they may market them immediately. Other investors buy stock with the intention of exercising rights and obtaining additional stocks so offered at a slight advantage over the market value. This is really a matter of investment rather than of taking profits, since the stockholder buys stock at less than the market price and has a potential profit at once.

Illustrating the comparison between the stock dividend and the subscription rights method is the following list of well-known public utilities which have adopted the policy of paying dividends exclusively in cash and issuing rights generally at par. The table, based on statistics in *Moody's Manual,* shows the percentage increase in stocks during the four years ended Dec. 31, 1926:

| | Stock Increase, Per Cent |
|---|---|
| American Telephone & Telegraph Company | 52.2 |
| Brooklyn Edison Company | 164.2 |
| Commonwealth Edison Company | 81.3 |
| Detroit Edison Company | 147.7 |
| Pacific Gas & Electric Company | 52.2 |
| Southern California Edison Company | 15.8 |
| Arithmetic average | 85.6 |

It is interesting to compare this average with the North American Company's stock increase, which was 100.2 per cent to the end of 1927 and 94 per cent during the four-year period used in the table, and for the purpose of a fair comparison it must be pointed out that the above table includes in some instances increases contributed to by such matters as conversions during the four-year period of bonds and debentures issued prior to the period; also, such conversions, although resembling rights, may or may not have been offered to the shareholders, and if not they decrease his proportion of interest in the company. In the case of at least two of the above companies the issue of rights is explained clearly in *Moody's Manual.* If a stockholder exercised his right 100 per cent the following would have occurred:

1. The Commonwealth Edison Company offered to its stockholders 20 per cent stock rights exercisable in February, 1923; 20 per cent in May, 1924; 12½ per cent in May, 1925, and 12½ per cent in August, 1926, which increased the stockholder's $100 interest to $120 in 1923, $144 in 1924, $162 in 1925 and $182.25 in 1926. In exercising these rights the stockholder subscribed for $82.25 additional stock. Meanwhile, he had received 8 per cent cash dividend, $32 on his original stock and $13.37 on his new stock, a total of $45.37. Thus in exercising his rights to buy $82.25 additional stock at par he had to pay $36.88 in addition to reinvesting the $45.37 received in cash dividends.

2. The Detroit Edison offered 25 per cent stock rights in June, 1923; 25 per cent in June, 1924; 10 per cent in October, 1925, and 10 per cent in December, 1926, which increased the stockholder's $100 interest to $125 in 1923, $156.25 in 1924, $171.87 in 1925 and $189.06 in 1926. In exercising these rights the stockholder subscribed for $89.06 additional stock. Meanwhile, he had received 8 per cent cash dividend, $32 on his original stock and $14.97 on his new stock, a total of $46.97. Thus in exercising his rights to buy $89.06 additional stock at par he had to pay $42.09 in addition to reinvesting the $46.97 received in cash dividends.

It is obvious that in either of these cases the additional stock purchased at par would have a market value today of more than 75 per cent above its cost. In order to maintain his proportion of interest in the company the stockholder was obliged to exercise all subscription rights offered him and to reinvest not only his cash dividend but an additional amount of cash. The stockholder of the North American Company, on the other hand, by retaining the new stock which he receives in the form of dividends maintains his proportion of interest in the company without additional investment. His new stock, of course, represents an increase in return in accordance with its enhanced market value.

### Does Not Reduce Equity

As the North American Company sees it, the problem is to provide required capital without reducing the strength of the stockholder's equity, either by offering stockholder subscription rights to new stock or by payment of dividends in stocks. The plan adopted, which makes the situation easier for the stockholder, is to issue stock quarterly for the amount of the dividends and either to send the stock to the stockholder or sell it for him, as he chooses. In our opinion it is more convenient for him to know that this will be done quarterly at the rate of 2½ per cent than to have 10 per cent or more in rights offered in one block at irregular intervals, when he would probably not be in a position to buy it.

A huge amount of new capital is required annually to take care of the normal development of the public utility industry and of a public utility company. This amount is from four to six times the increase in gross revenue during the same period. It is therefore my opinion that the policy of paying dividends on the equity in stocks is adapted admirably to the public utility industry, since its consistent and rapid growth requires so large and constant an increase in equity capital to keep the financial structure well balanced to facilitate senior financing.

## System Routine in Emergency Switching

By C. P. Hubbard
*Chief System Operator Detroit Edison Company, Detroit, Mich.*

ALL GENERATING station and substation operators in the Detroit Edison Company system are thoroughly drilled in procedures to follow in case of system emergency. These standing instructions, which are revised from time to time in the office of the system operator, include definite orders applying to the system in general and to the local plant or substation in particular and action which can be taken by operators without first notifying the load dispatcher. Notification of the load dispatcher is required at the earliest possible moment. Code signals sent simultaneously to all stations by the load dispatcher over the private telephone system assist in handling system emergencies.

Orders which are simultaneously transmitted to all stations apply in most cases to direct-current distribution, the power-line system and street-railway supply. The code employed is indicated below:

1. Three short rings and one long ring on private telephone—close all direct-current distribution feeders and pick up load on motor-generator sets.
2. Double three rings—open emergency power lines.
3. Four short rings—lower potential to 400 volts on street-railway generators.

In case of interruption of an incoming line feeding station apparatus the operator immediately restores the apparatus to operation by putting it on another line. He does this before notifying the load dispatcher. The operator will not take this action, of course, if it is patently apparent to him that the cause of the interruption lies in the local apparatus. He does it only if he is reasonably sure that the trouble is outside of the station, which in most cases it is. It is the responsibility of the operator to be fairly sure that offending apparatus in the station is not going back on a good line and thus continuing the trouble. In view of the necessity for maintaining reliable service this practice is regarded as justifiable and safe.

In emergencies that affect supply to customers at primary and higher potentials, these customers do not get into direct communication with load dispatchers or station operators. It is a company rule that customers' calls shall be handled by the general trouble board. This board has positions occupied by experienced men who are familiar with the distribution and transmission systems and with system operation procedure. These men are more competent to deal with the customer who is affected by system trouble than is the load dispatcher who is working at high pressure in an emergency.

## Automatic Furnace Permits Accurate Heat Control

By W. J. Diederichs
*Industrial Heating Engineer*
*Westinghouse Electric & Manufacturing Company*

The application of an electric rotary hearth furnace to the hardening of drop-forged wrenches has resulted in improvements in the quality of the products. These wrenches vary in size, requiring a large variation in heating time, and are treated in quantities of 1,200 lb. per hour regardless of the size. Warpage is a serious factor and individual quenching of the pieces is deemed necessary. It is also required, due to variation in size and analyses, that quenching be carried out at temperatures which vary from 1,400 to 1,575 deg. F.

*Automatic heat treating produces uniform products in this electric furnace*

The furnace provides an annular heating chamber 32 in. wide by 30 in. high, the floor of which consists of a rotating hearth covered by alloy plates elevated above the brickwork of the floor. The hearth is motor driven and is normally stationary. The control of this drive is such, however, that at regular intervals the hearth is automatically advanced the distance between the charging and discharging door and stops. The furnace has been equipped with a special charging device which, as shown in the accompanying illustration, is located in front of the charging door at the right. This device places a definite weight of work on the hearth each time it is operated. The hearth remains stationary while a new charge is entered and while a properly heated charge is individually and manually quenched at the discharging door. The time which the hearth remains stationary is adjustable, and by this means the time the work remains in the furnace, subjected to heat, can be varied through wide limits. This permits the adjustment of the heating cycle to the size of the work to be treated.

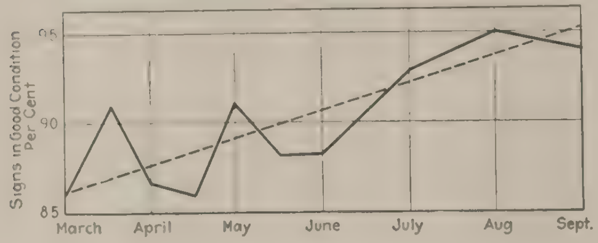
The furnace has an electrical input of 126 kw. for operation on 110-volt, three-phase power supply. This input is divided into two zones, each occupying one-half of the annular chamber. Each zone is independently controlled by a separate pyrometer and thermocouple actuating suitable contactor panels. This two-zone arrangement of input permits adjusting the temperature being maintained in the ingoing and outgoing halves of the chamber and makes it possible to vary the rate of heating the work in accordance with manufacturing and material requirements.

The furnace, when operating at a production of 1,200 lb. of work per hour at a temperature of 1,575 deg. F. successfully treats 9½ lb. of work per kilowatt-hour of energy consumed.

## Electric Sign Maintenance Plan Increases Revenue by $2,000

As A result of a nine months' experience with intensive efforts to improve the illumination of existing electric signs and floodlighted bulletins, H. L. Johnston, manager of industrial and commercial lighting Duquesne Light Company, estimates that an outlay by this utility of $300 for labor and material will have increased the revenue from this source by some $2,000 in the first year.

A survey of the electric signs in the most active sections of Pittsburgh indicated that a considerable percentage of these devices were not operating at their maximum efficiency. Many lamps were found to be inoperative, and in a number of instances signs were neither adequately cleaned nor painted to attract the desired attention. In order to maintain electrical advertising on a high level an effort was made to call the attention of the owners to the impaired effectiveness of the devices and to the desirability of restoring the equipment to a satisfactory condition. A total of 950 signs were listed in the principal business districts and inspection routes were planned, including approximately 125 installations apiece. Each route was then given to a man, who covered his assignment between 8 and 10 o'clock in the evening and who checked for burned-out lamps, inoperative equipment and other points involving poor conditions. Each route was checked twice a month until the summer months were reached, when the interval was lengthened to provide monthly inspection.



*Electric sign operation improved as a result of periodic survey*

A card with the name and location of the sign included a list of the major defects that might be involved: Part of lights out; all lights out; needs cleaning; needs painting; exterior lighted and interior lighted. Space for notation of equipment in good order was provided. Upon completion of the check, a card indicating conditions as found was sent to the owner.

At the time of the initial route coverage, only 87 per cent of the signs were estimated to be in first-class condition. Two weeks later a 91 per cent satisfactory condition was observed. Subsequent checks, while not meeting with the same effective response, indicated a general improvement until it was necessary to send cards regarding but 5 per cent of the signs surveyed.

## Cost of Electric Cold Storage in Farm Dairies

RESULTS of electric refrigeration as compared with natural ice on three retail dairy farms over a period of from two to four years each have recently been summarized by the New Hampshire Agricultural Experiment Station (of the University of New Hampshire) for the New England N.E.L.A. committee on the application of electricity to agriculture. On these farms the storage rooms ranged in size from 170 to 207 cu.ft. The refrigeration equipment was the same in each case with the exception of the motors, which were either ⅓- or ¼-hp., and the compressors were two-cylinder, reciprocating, air-cooled, gear-driven units using methyl chloride as a refrigerant. Initial investments for mechanical refrigeration equipment ranged from $350 to $766.50. The former was on a rental basis, which has been discontinued, so that from $770 to $775 is now required. For the natural ice method the initial investments varied from $135 to $775. The average for all refrigerating methods amounted to $455.

Yearly fixed charges are generally less for the natural ice method. Cash expenses for operating electric refrigerating units varied from 17 to 52 per cent less than for natural ice, but in one case were 12 per cent in favor of the electric method. The storage rooms were designed to carry an average load of 300 qt. of bottled milk per day and a maximum of 420 qt. has been stored. The maximum outdoor temperatures met were 102 to 104 deg. F. in the sun, at which time the cold storage was 50 deg. on one farm and 44 deg. on another. The average cold storage temperatures for these farms was 43 deg. for a year when the outside temperature averaged 62 deg. An average difference of about 20 deg. was maintained. The equipment operated 50 per cent of the time on two farms and 40 per cent on the third. Dairy cold storages consumed from 10 to 42 per cent of the electrical energy used on each farm for a year. The demand of the ¼- and ⅓-hp. motors under running conditions was from 320 to 360 watts and the maximum demand on starting was as high as 1,340 watts.

The energy consumption costs of the electrically operated units ranged from $37.31 to $75.60 per year on rates varying from 3¼ cents to 7 cents per kilowatt-hour. The average for all years and all farms was $48.83. When using natural ice, operating costs (labor, ice and sawdust) ranged from $196.40 to $325.92, with an average of $236.56. Due to the almost complete elimination of labor the operating costs for the electric method were consistently less than for ice, the natural ice costs averaging 383 per cent greater than the electric bills. The energy consumption varied from 772 to 1,479 kw.-hr. per year, including both nine and twelve months' operation, and the total over-all electric costs ranged from $106.71 to $135.35 per year, or an average of $118.33. The total expense ranged from 67 to 140 per cent greater with natural ice and averaged 100 per cent more than the total cost of electric refrigeration.

On a total cost basis, the average of all farms was:

| | Natural Ice | Electric Cooling |
|---|---|---|
| Cost per cubic foot of total contents | $1.19 | $0.62 |
| Cost per cubic foot of storage contents | 1.32 | 0.69 |
| Cost of 100 qt. milk per year | 0.30 | 0.15 |
| Cost per 100 qt. milk for period machine was run | 0.51 | 0.25 |
| Cost per cow per year | 6.36 | 3.17 |

# Some Experiences in Price Cutting

A close-up picture of the present tension in the market. Why the seller and the purchaser are at loggerheads

By Earl Whitehorne
*Commercial Editor* Electrical World

IN ANY discussion of the evils of price cutting, sooner or later the talk must get down to cases. It is perfectly natural and practical and proper for the purchasing agent to buy as cheaply as he can. And it is no less right for the manufacturer who sells the goods to get as profitable a price as possible. But in the evolution of business certain principles have developed and certain responsibilities. The trickery that once was the life and sparkle of horse trading is now frowned upon. Fair dealing has become the accepted standard in commerce, a live and let live policy that considers as satisfactory only a transaction that is of benefit to both contracting parties. The seller is supposed to give honest value and the buyer is expected to pay an honest price. Surely nowhere is this better understood and recognized than in this progressive, enlightened and prosperous electrical industry. Why, then, is there so much talk right now of trouble between large buyers and sellers? What has gone wrong in the market place that there is bitter talk of price cutting by manufacturers and profiteering by purchasers?

*In a recent article entitled "Who Pays the Cost of Price Cutting?" Mr. Whitehorne discussed some aspects of the present buyers' market in the electrical industry. The purchasing agent is charged with profiteering by ingenious methods of beating down price levels. The manufacturer is accused of price cowardice. The result has been demoralizing in many lines.*

*Therefore it has been recommended that secrecy be eliminated wherever bidders are called upon to reduce a price after bids are in, and that the salesman should demand a showdown and not accept the mere statement that he is the high bidder.*

*Many letters of widely varying opinion and many recitals of personal experience have been received. This article carries the discussion further, with a more intimate picture of conditions involved on both sides of the bargaining.*

Editor.

### Tricks of the Purchaser

Study it a bit and you find an interesting thing. There are some manufacturers who have the courage to establish prices and maintain them. Their price is their price and they refuse to dicker. But there are some who lack the courage or the strength. And just so there are some purchasing agents who do not haggle. They ask for bids from suppliers whose product is acceptable and the low man gets the business. But there are others who seem to consider their function one of dollar squeezing, and the length to which this gentle art is carried is astonishing. By way of illustration let's just consider a few examples:

*Case No. 1* — One very large company has a purchasing agent who seems to have complete control of the engineering department and his method is as follows:

The engineers confer with salesmen of various manufacturers and, after getting the needed information, issue specifications giving the amounts of apparatus desired, item by item. These are then turned over to the purchasing department and bids called for. The bids, when received from the manufacturers, go to the engineering department, are tabulated and analyzed. After this procedure they are handed to the purchasing department with the recommendations as to what the engineers would like. These engineers know what they want, but are required by the purchasing agent to give the names of at least three manufacturers whose apparatus would be acceptable, although the engineers, from an operating standpoint, would probably know definitely that one particular type of apparatus or one particular manufacturer would give the best results.

The purchasing agent then notifies the various bidders to appear at his office on a certain date, and the result is a flock of salesmen, the majority of whom never had a chance, but do not know it, as their names are not included in the engineers' recommendations to the purchasing agent.

The purchasing agent then retires to a large conference room and calls in his group of engineers—sometimes as many as 30. One by one the salesmen, those who have a chance and those who never had, are stood up before this imposing group. It is like a man at the bar facing a judge and jury. The purchasing agent, a very imposing individual, then holds up a bid, asking the trembling salesman if it is his. Admitting the charge, the purchasing agent barks out: "Is this your lowest bid? You have one chance to cut the price."

And so the bidding goes, until the harassed salesmen paint by telephone or telegraph to their main offices a story of the battle as they see it. Usually the story is utter defeat unless the price is reduced.

In a few hours each is called in to report again and given another last chance and somebody weakens. Then, after all this, the three representatives of the manufacturers selected by the engineers are again called in one by one. They are then given another chance to cut the price, so one by one they are worn down and one of the three eventually weakens. The net result is that some manufacturer takes a loss; the two others are sore, revengeful and swear to get even the next time with this manufacturer to whom the business was awarded, usually overlooking the fact that the purchasing agent is the one they should swear at.

When the next negotiation comes up it is usually awarded to some one other than the first successful bidder, and this goes on year after year.

*Case No. 2* — A practice more or less common in a large company is to issue calls for bids on a certain specification. After all the proposals are in, the purchasing department tabulates them, and calling in the bidders one by one, each is told or led to believe he is a little high in price. Finally one decides to meet or better the lowest bid submitted. All are in a roundabout way given an idea as to the amount of the lowest bid, told to get in touch with their factories and sharpen their pencils.

As a result, one or more of the manufacturers "bite" and come in with a still lower bid to "get in," as the salesman often says. This is especially true of some one who considers himself an outsider or has never been successful in securing business from this particular buyer.

When the purchasing agent has interviewed the entire list and held them on "hooks" for a time all the bidders are notified that the specifications have been changed by the engineers and new bids will be called for.

Practically all the time and expense of the first bids are thus lost and the merry-go-round starts all over again. Each one having spent considerable money by this time, some decide to go after the business hard in the hope of saving something out of the wreck. The net result is a free-for-all fight, but the business usually goes to the manufacturer whom the purchasing agent has had in mind all the time—at a lower price.

## To the Purchaser

*INDUSTRY needs more intelligent buying. It needs purchasing agents who know the values of the equipment they buy and make of their function something more than an adroit matching of prices. It needs frank, open recognition of the fact that what is bought must be paid for and that bids which embrace elements of engineering and of service, as well as the delivered product, cannot be compared by a mere tallying of the total cost figures.*

*Therefore, the time must come—will come—when the purchasing agent no longer shall be rated for his penny-squeezing ability, but for his engineering skill in sensing and securing the greatest values for the money spent. And one of his greatest resources will be the good will and support of his suppliers.*

The majority of the bidders never had a chance, but were systematically used to beat down the price. This method of procedure not only costs apparatus manufacturers a great deal of time and money but also wastes time and money for the purchasing and engineering organizations who award the contract.

*Case No. 3*—Some purchasing agents insist on a lump sum price on all major electrical apparatus required on a job. This lump sum might include transformers, oil circuit breakers, disconnecting switches, air-break switches, switchboards, regulators, outdoor substations and cable.

There are very few companies in this country that are in a position to offer such a complete bid. The smaller or specialized manufacturers are at a disadvantage when the engineers favor their equipment for a certain portion of the work, but the purchasing agents insist on a lump sum bid.

In order to obtain the lowest price, the purchasing agent will often ask the larger companies the amount of reduction they will make in case a certain item is eliminated from the lump sum bid. In order to protect their lump sum bid the larger companies' deduction will naturally be less than it should be when in straight competition.

The smaller manufacturers who cannot bid on the entire specification, but who may have equipment more suitable for the work desired by the engineers, are advised by the purchasing agent that they can have a certain portion of the business by taking it at a figure equal to the larger companies' deduction on that item from the lump sum bid.

By this method the smaller manufacturers are therefore offered the business at a price very much under the normal price, and if one of them takes it he is quite apt to lose money. On the other hand, if refused the business the purchasing agent will tell him that he was high in price and the business went to one company on a lump sum basis.

*Case No. 4*—One large purchaser of apparatus has a purchasing department which has successfully carried out the following plan:

Bids are called for on, say, 21 items, all of which can be supplied by one of several manufacturers. The bids specify itemized prices and a lump sum proposition.

The purchasing agent carefully picks out from all the bids the lowest price on each item. One man may be much lower on item 7. The purchasing agent then makes up his own lump sum proposition. Should any of the bidders in their proposition state that on a lump sum basis they will give a further reduction of, say, 5 or 10 per cent, the purchasing agent also takes this off his own lump sum tabulation.

The manufacturers' salesmen are then summoned and each one in one way or another learns that the purchasing agent has a lump sum figure considerably lower than that quoted by the salesman, who quickly wires the factory. In some instances the salesman actually finds out the exact lump sum figure referred to.

The net result is, the purchasing agent, by setting up this artificial lump sum figure, generally succeeds in knocking down the price of the manufacturer with whom he intended doing business from the start or whose apparatus is really specified and wanted by the engineering department.

*Case No. 5*—In a recent purchase of a large order five manufacturers bid. One was very high and was counted out. Three were low. The purchasing agent sent for the other bidder who was next below the high and told him that his equipment was desired and offered to give this firm the order at a price to be set by averaging the three low bids and adding 10 per cent. This is an inaccurate way of establishing the value of electrical machinery, to say the least, but he took the order.

*Case No. 6*—A purchasing agent asked for bids on a number of large machines involving a considerable element of design and engineering. The purchaser's engineer stressed the need for the highest efficiency obtainable. Several bids were entered involving a large expense. The high man was told that he would have to cut so many thousand dollars if he was to get the order. The purchasing agent asked the salesman: "Why should you expect to get so much more money than the X-Y-Z Company for the same size machines?" The sales engineer said: "Mr. Pricer, there are very specific reasons, based on definite engineering considerations, why our machines are worth more money to you. But there is no point in my taking your time to go all over them because you are not an engineer and will not understand the values that I am talking about. But I will be glad to go all over it with your engineer. If I can convince him that our machines are worth that much more than the X-Y-Z, will you consider this added value as a factor in our bid?" And the purchasing agent said: "No, each company must be on a par and the price decides it." And that was that.

### Typical Situations

The number and variety of these cases are without end, but certain typical situations stand out:

1. Where the purchasing agent gets the high bidder to cut on the indefinite promise of a large block of business next year.

2. Where the buyer lies, giving the bidder a false intimation as to his competitor's price, or representing the competing price on motors alone, for instance, as the complete price for motors and control, or citing a price on equipment that is not comparable, or ringing some other subtle change on the truth that deceives and tempts the manufacturer to cut.

3. Where the large buyer demands special discounts for large volume, claiming that this volume carries the manufacturer's overhead, and thus forces the big manufacturer's price down to where the small manufacturer cannot compete.

4. Where very large buyers of electrical equipment that is used as part of a manufactured product threaten to make their own motor or control or whatever it is unless the price is cut.

5. Where large utility holding companies argue that one of the savings possible through holding company operation should show up as savings in purchasing, and demand discounts over prices given to operating companies, which eliminate the small manufacturer and force the large manufacturer's price below the margin that provides for the further development of bigger and better apparatus.

6. Where purchasing agents apparently do not know how to buy because they have no facts to check bids with and no methods of evaluating bids and therefore resort to haggling.

### WHAT THE SELLER DOES

That's what they are saying about the purchasing agent—not all, of course—but many. But what is the matter with the manufacturer, you'll say, that he should admit to all this unsound and unfair treatment? Why does he fall for such methods? There is the rub. The manufacturer right now finds himself in a buyers' market. He is embarrassed in many fields by overcapacity and overproduction. He has permitted himself to become involved in a mad scramble for orders that has enmeshed him until for every story reflecting upon the purchasing agent there are fourteen about the manufacturer and his salesmen. As one man put it, "You can take a pure young man and make him a purchasing agent today and before Sunday the manufacturer's salesmen will have taught him all the dirty tricks in the business."

The utility purchasing agents say that the manufacturers are themselves the greatest culprits and are responsible for price buying. They say that first bids today are made for trading purposes only and that the bidders come to them before the ink is dry on the bids and offer to cut the prices. Therefore, they say, they too must use trading methods, because those are the methods that the manufacturers have developed and seem to understand. The purchasing agents say they are willing to pay fair prices, but that the manufacturers haven't the courage to put fair prices on their products and then stick to them.

### To the Manufacturer

*INDUSTRY needs more sincerity in selling. It needs manufacturers who consider that a bid is a word given—an honest offer of service to a friend—and not just a gesture in a sparring match. In other words, a bid from a responsible concern to a reputable customer should be a firm bid, the pledge of the house, signed with its good name. And such a bid is the equivalent of an open bid because there is no trick in it. It is not subject to revision, any more than the written word of that manufacturer is subject to question, because his honor is involved.*

*Firm bids preclude price cutting. They possess every advantage in competition. They maintain price levels by natural processes. They protect both the seller and the buyer by banishing the unseen menace of deceit.*

The small manufacturer also charges that although the large electrical manufacturers state that they desire competition and see no virtue in monopoly, yet they chafe under the competition of the small manufacturer and cut prices to get business, relying on price cutting and not on better quality, better delivery or better salesmanship to maintain their position. It is alleged that the spread of prices established by these larger manufacturers is unreasonably wide and is not justified by the savings effected in making and selling the larger quantity to the large buyer.

Again, the large manufacturer says that his responsibility to keep his plant busy gives him a natural right to price low at times on orders needed to load some department of his factory that is running short. The small manufacturers, he says, with low overhead, have ample advantage in the market place, but rely too much on price paring and too little on engineering service and quality of product.

In this competition which is being waged between the manufacturers certain practices are followed which tend to aggravate the situation:

### TRICKS OF THE MANUFACTURER

1. The large manufacturer uses the lump sum bid as a lever to lower prices on individual products to compete with the small producer who specializes in that line. It is said that at times this is so manipulated that it has the effect of a straight price cut.

2. Allowances are made on old equipment taken back that range all the way from a reasonable scrap allowance to the full original price. This is pure price cutting when the allowance is more than the seller may reasonably expect to realize from the second-hand value.

3. Some manufacturers are making extravagant contributions in preliminary engineering expense for detailed working data that are out of all reason and constitute a price consideration because they put an undue extra burden on the profit.

4. Financial affiliations between some manufacturers and the utility companies are used to bring pressure from on high to throw the order.

5. Reciprocity arrangements are drawn into competitive bids to an extent that overshadows the actual comparative values involved and works an injustice upon bidders who are invited to compete with the assumption that it is to be a fair and open contest.

6. And then there are the everyday conditions of price cutting, where the manufacturer loses his nerve and pares his price for no other purpose than to get the order and camouflages it with all manner of alibis and explanations, such as a mistake in figuring, or new information, or an unexpectedly favorable purchase of materials, or some other cock and bull story. Here are a few of the usual experiences:

*Case A*—Purchaser in the market for a 000-hp., 000-r.p.m., synchronous motor. Low bidder $8,450, with other bids materially higher. One bidder received a tip that the other really higher bidder was $7,900. He revised his bid and took the order at that figure. The other bidder held his price and checked up afterward and they found out.

*Case B*—A purchaser advised a bidder that he was getting an extra 5 per cent from another bidder on some standard listed apparatus and that he would have to meet the figure. He did, and it developed that the extra 5 was on a single order aggregating over $50,000.

*Case C*—A recent order was taken for $58,650 on specific information from the buyer that a certain manufacturer had made a price of $57,000. The original bid of the successful (?) bidder was $74,000. A later check-up disclosed that original bids ranged from $70,077 to $74,000 and no other changes were made.

*Case D*—A bid was made when it was known that there were only two companies competing. One was high and under pressure came down, but the other bidder got the order, anyway. It was finally explained that the president of the purchasing company had over-ruled price and ordered the business to be given to the other firm on "policy," for reasons unknown to his subordinates.

### The Moral Aspect

And there you are. Some men will say that all this is natural, because men are different and act differently. It has always been so, they say. But is that a reason? There are many time-honored practices that some day will give way to the onward march of principle and be changed. There are many things that men used to do that have been stopped and are not countenanced today. After all, it gets down to a very simple consideration of plain honesty. If a purchasing agent lies or otherwise deceives a bidder into cutting his price he is not dealing honestly. He is not fair. And if a manufacturer offers a bid that is not fair, either because the goods are not worth the money or because he has padded the price for trading purposes, he is not dealing honestly. It is not square when you come right down to the plain facts. It is trickery. It is an effort to take advantage of the other fellow.

Everybody will agree that it is considered wrong to slip your hand into a man's coat pocket and extract his wallet while his attention is distracted. No purchasing agent will do this to a salesman. No manufacturer will do it to a buyer. Well, the only difference is that dickering with bids and cutting prices has not yet lost its social standing. Today it involves no conspicuous degree of moral turpitude. But gradually it is going to be ostracized. The day will come when between intelligent business men price cutting will be taboo.

For with electrical men there is something more to it than just a matter of personal bartering between individuals. We have an industry involved, responsible for the maintenance of a great public service. We have a broad market to be maintained. And it is a matter of simple, inescapable truth that destructive commercial warfare between competitors or between buyers and sellers eventually demoralizes markets, wrecks the economic health of the industry and ultimately paralyzes the service upon which the public is dependent. And that is the reason why we find modern business bulwarked about with codes and standards and principles, with a highly developed system of self-imposed controls that have evolved out of experience because without co-operation and mutual good will there is no safety for investment, no stability upon which to base projects and plans.

And this responsibility for safeguarding the economics of business is an obligation that cannot be forgotten very long even in the relationships between one large buyer and his supplier. Profiteering purchasers and price-cutting sellers are forgetting this in an excess of zeal for sharp buying and for order snatching. But carried too far it brings its own defeat, for the manufacturer goes broke and the purchaser finds himself at last surrounded by enemies and he is lost.

### Two Objectives

The greatest single problem in this whole situation to my mind is the difficulty of shaking men loose from the purely negative idea that because these unintelligent buying practices are general and have existed for long, they can't be changed. But that is just foolishness. Every buyer wants to get his money's worth. Every seller wants to get a fair price. No more is wanted, no less is satisfactory. What can be done, therefore, to put an end to the haggling and the price cutting? Fundamentally, it seems to me there are two things to be done:

1. *By the Purchaser* — Industry needs more intelligent buying. It needs purchasing agents who know the values of the equipment they buy and make of their function something more than an adroit matching of prices. It needs frank, open recognition of the fact that what is bought must be paid for and that bids which embrace elements of engineering and of service, as well as the delivered product, cannot be compared by a mere tallying of the total cost figures.

Therefore, the time must come—will come—when the purchasing agent no longer shall be rated for his penny-squeezing ability, but for his engineering skill in sensing and securing the greatest values for the money spent. And one of his greatest resources will be the good will and support of his suppliers.

2. *By the Manufacturer*—Industry needs more sincerity in selling. It needs manufacturers who consider that a bid is a word given—an honest offer of service to a friend—and not just a gesture in a sparring match. In other words, a bid from a responsible concern to a reputable customer should be a firm bid, the pledge of the house, signed with its good name. And such a bid is the equivalent of an open bid because there is no trick in it. It is not subject to revision, any more than the written word of that manufacturer is subject to question, because his honor is involved.

Firm bids preclude price cutting. They possess every advantage in competition. They maintain price levels by natural processes. They protect both the seller and the buyer by banishing the unseen menace of deceit.

All this will not happen at once—not this week. I know it. But industry can work toward it—can fight for it. And the logical approach to it is for the seller to refuse longer to cut his price because the buyer tells him to. Let him at least begin to protect himself by making sure that the other bids that he is asked to beat are comparable and that the purchasing agent is not lying. If he is asked to refigure after the bids are in let him at once demand that all the bids be opened to inspection. And also, it is time the manufacturer knew a little more about the reasons why he loses orders, through regularly organized post-mortem studies of the bids on his last business.

There is no lack of engineering in production. Production is organized strictly according to facts. But production is dependent upon purchasing for continuity and quality of supply. It is time to replace wit matching and blind bartering in industrial buying by an engineering approach to truth in values.

The days of haggling and bickering are all done in retail trade. Some day price cutting will pass out of industry. And men will wonder why it was that we could have been so long blind to economic truth.

# Women Workers Used in Service Representative Plan

By W. G. Burrill
*Commercial Manager Associated Gas & Electric System, Staten Island, N. Y.*

THE home service representatives of the Associated Gas & Electric Company call on customers in their homes with the primary purpose of learning to what extent they are using electric service, checking the number and kinds of electric appliances which they own, learning what interest they have in other appliances and making minor repairs to appliances found on the premises which are out of use on account of cord or plug trouble. Women representatives are used for this home service work.

The result of this survey is posted on a card containing the customer's name and address and constitutes a record, which is brought up to date from time to time, of the customer's use of electric service in the home. When customers are found to be interested in appliances which they do not own the information is passed along to our sales organization by means of prospect cards and followed up by a salesman.

Home service representatives are not permitted to make sales. Their work is, in the last analysis, selling electric service, and is therefore more educational in character than anything else. Customers are contacted by the home service department through the mails with printed matter explaining the use and character of various appliances, together with recipes of foods to be cooked on the electric waffle iron, electric range, and frozen dainties to be prepared in the electric refrigerator. Contact is also made by means of lecture work to women's clubs, church societies, parent-teacher associations, etc. In addition to this type of activity classes are also conducted in co-operation with and in the public schools to children twelve years of age or thereabouts in the use of the electric washing machine and electric iron, how to read the meter, replace fuses, etc.

We feel that this work is doing a world of good, both to our customers and the company. Complaints of service are often adjusted by home service representatives, and when not possible of being adjusted are referred promptly to the proper department for attention, which gives us a check on the efficiency of various departments and enables changes in methods, routine and policies to be made before any great damage has been done to public relations.

In choosing home service representatives preference is given to high school graduates who have had the domestic science course or home-making course, supplemented by a background of housekeeping activities in their own homes. A course of training in company policies, rates and routine is given to the girls before they do any active field work, together with proper training in the care and operation of the various appliances. Our home service representatives are competent to demonstrate devices sold by salesmen, thus relieving the latter of this responsibility and enabling them to devote their time more intensively to sales promotion.

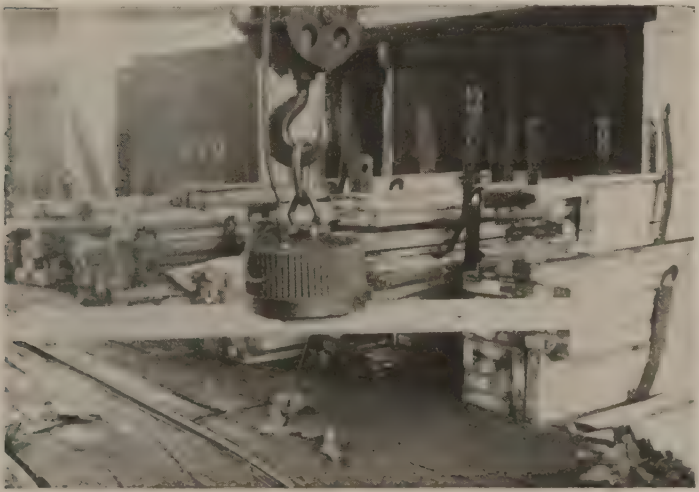
We feel that to get a coverage of our customers once a year one home service representative should be employed for each 1,000 residential customers, although we are not organized in our company at the present time on quite so extensive a scale.

# Magnets Successfully Handle Coiled and Boxed Steel

COILED strip steel is a difficult material to handle, for unless the coils are tightly bound together they will pull apart and cause confusion to the handlers and damage to the steel. A strip steel coil, even though securely bound, is a heavy, awkward thing to handle and the moving of any amount of this steel requires a gang of husky men, who must be continually cautioned against battering the finished steel strip.

The Superior Steel Corporation at Carnegie, Pa., whose product is largely cold and hot rolled strip that is shipped both in coils and boxed flat, has adopted the Electric Controller & Manufacturing Company's lifting magnets for handling the finished steel, using manual labor only where necessary to move the bundles or boxes into closed freight cars. At this plant the company recently loaded 200,000 lb. of strip steel into box cars with the magnet and four men during a ten-hour shift. Before the magnet was purchased the most that six men could load was 140,000 lb. in a ten-hour shift.

The magnets usually handle two coils at a time, and if



*Magnets handle 600 to 1,000-lb. packages of boxed strip steel. Thin sheets aid in handling of coiled strips* these two coils are not placed tightly up against each other one or both of the coils has a tendency to fall away from the magnet and be held in a vertical position. Because the steel must not be battered, it is not satisfactory for the coils to be dropped on their edge. In experimenting with the magnets on this job of handling coiled strip steel the Superior Steel Corporation discovered that a thin sheet of steel placed over the two coils to be lifted would spread the flux from the magnet sufficiently to hold both coils flat against the plate. It is a peculiar fact that this plate does not short circuit the flux, but causes the magnet to do a better job than without the plate.

## Rural Bills Collected When Meter Is Read

THE practice of making collections by the meter reader at the time he reads the meter in rural sections has been found by the Portland (Ore.) Electric Power Company to effect economy and aid in maintaining closer relations with the farmer, according to R. R. Easter, manager of the Tualatin Valley division. Moreover, a complete understanding is had as to the bill without delay; collections are greatly facilitated, and in many cases where the farmer has no checking account he is aided in making his payment.

An intelligent meter reader can be of great value to the company in such cases, as he not only creates a proper impression of the company in the customer's mind but, also, he is able to learn of his needs in so far as additional current-consuming devices are concerned and, in many cases, to obtain his partnership in the business through the sale of stock. An ordinary bill form is used. The meter reader makes out the bill at the time the meter is read from the customer's schedule for the previous month, which he has with him. In a large percentage of cases the bill is collected at the time, conveniencing not only the farmer but the company as well.

It has been found, however, that such good results do not obtain in commuting districts, where customers are more in the habit of paying by check. Quite often they are away from home or do not have the available funds except for a short period after pay day; nor is the average commuter such a willing listener in so far as purchase of additional appliances or stock is concerned.

### *Service*

The fundamental of good public relations is good service. There is no substitute for it. If we don't give good service, we won't deserve the public good will. So far as this company is concerned, it desires to have the good will of the public, but even more than this it desires to deserve it.

P. S. ARKWRIGHT,
*President Georgia Power Company*

## Letters from Our Readers

### *An Insidious Misuse of the Schools*

*To the Editor of* ELECTRICAL WORLD:

An insidious misuse of the public schools for the dissemination of government ownership propaganda is being made in New York City and probably elsewhere through the courses in "current events." For these courses weekly four-page leaflets are used, issued under the title "Loose-leaf Current Topics." These printed leaflets bear no editorial address, but those issued under the name of the "New York City Edition" are apparently published at 1123 Broadway, New York City, though there also appears to be a general publication office at 40 South Third Street, Columbus, Ohio.

The issue for the week of Feb. 27 to March 2, 1928, issued as Vol. XIII, No. 5, contains an article under the caption "Our State Water Power," beginning as follows:

> The cost of electricity to householders in New York City is 7 cents per kilowatt-hour, as charged by the New York Edison Company, a private company.
>
> This charge is "one of the cheapest rates in the United States for electricity generated from coal." In Toronto, Canada, the average cost of domestic service obtained from a public-owned water-power system was only 1.7 cents per kilowatt-hour in 1926.

Next, quoting Governor Smith, "New York State is probably the richest state in the Union in actual power resources. For years and years the resources have been allowed to run to waste." The article proceeds to ask why it is that, while other states and cities are enjoying the advantages of cheap electric power, New York State has been so slow in developing its vast sources of power in the St. Lawrence and Niagara Rivers, and answers by pointing out that "our Democratic Governor and our Republication Legislature cannot agree," and contrasts the opposing views on state development as against private development under lease.

Suggesting the precedent of the Port Authority, the article concludes that electricity generated under a similar authority would cost the consumer less than if developed by private capital, because there would be no stockholders and no profits.

The fair and impartial presentation of the elements of important economic problems affecting our national welfare has come to be recognized as a legitimate function of our public school system. We are living in an unprecedently complex civilization; we send our children to school to prepare them effectively to meet life's problems.

But an unfair and one-sided presentation of any great economic problem on which there is an honest difference of opinion is a misuse of the high privilege and duty of our educational system. The dissemination of untruths or half-truths through these leaflets, under official sanction and therefore accepted as free from any taint of propaganda, to thousands of teachers and tens of thousands of students, and through the latter again influencing tens of thousands of homes, is a thing to be vigorously combated.

GLADYS FELLOWS.
New York City.

# Digest of Electrical Literature

## *Hydro-Electric Development and Steam Equipment*

*Heat Transmission Through Boiler Tubes.*—A discussion dealing with the rate of transmission of heat through a boiler tube from the outside inward; that is to say, a water tube boiler in contrast to the generally followed procedure of investigating the fire tube boiler has recently been completed. The information given is unusual in that the experimenter has endeavored to take into account all those variations from full-size boiler construction practice which are necessary in a small experimental installation. As a result of this investigation the following conclusions were developed: The coefficient of heat transmission of the apparatus is affected by the rate of gas flow and the temperature difference between flue gas and water as well as the pressure at which steam is generated and the temperature of the gas stream; the coefficient may be expressed in terms of the variables by means of certain derived equations; the water velocity in the tube has slight effect on the over-all coefficient of the transmission; the water velocity in the inclined tube of the apparatus varies as the steam rate and total energy input and tends to approach the practical maximum at slightly over 3 ft. per second; the water velocity is affected by the steam pressure, and the temperature gradient from the flue gas to the water in the tube varies with the flue gas temperature, the rate of gas flow and the steam pressure.—*Engineer (England)*, Feb. 10, 1928.

## *Generation, Control, Switching and Protection*

*Selective Protection.*—H. Puppikofer.—The steadily increasing unit size of generators and transformers in modern power stations ties up more and more capital per unit, causes a rising percentage of lost power when inoperative and warrants, therefore, expenditures for the best possible protection. The cost of the protective equipment may usually be considered to have been paid for when a large generator has once been saved from serious damage. Descriptions and operating characteristics are given of several modern selective protective systems, including the following: Back-flow watt relay, differential relay, self-balanced Ferranti relay, transformer relays, busbar protection, over-voltage protection, overcurrent protection, de-excitation methods and a note on internal fire protection. The necessity of an independent and absolutely dependable source of direct current which must be available at all times to provide the required control current for the protective relays in case of emergency is emphasized. A storage battery is frequently used for this purpose, although a Swiss concern advocates a small auxiliary generator on the shaft of the main machine to supply only the control current.—*Bulletin de l'Association Suisse des Electriciens*, February, 1928.

*Generating Station Bus and Switch Structure Design.*—Data as to the types of indoor bus and switch structures being used in 24 typical generating stations selected to give a great diversity of size and location from among those of more recent design in the United States are included in this report of the electrical apparatus committee of the N.E.L.A. Among the factors which have been considered in the course of the investigation and compilation of data are: Isolated phase versus adjacent phase; vertical isolation versus horizontal isolation; gasproof construction; fault bus protection; insulation of buses; bus housing construction, and cell construction. The comments of several manufacturers have been incorporated in this compilation as an expression of contemporary possibilities in this direction. Single-line wiring diagrams and simplified layouts of equipment placements have also been included.—*Serial Report National Electric Light Association*, February, 1928.

## *Units, Measurements and Instruments*

*Ground Detection.*—John Auchincloss.—The various means of detecting the impairment of resistance to ground has been considered, with particular reference to the instruments used for such determination. The various types of commercial circuits call for different schemes of ground detection and each is described in connection with the individual type of circuit for which it is adapted. In this connection the 125-volt, direct-current, two-wire ungrounded circuits, the Edison three-wire ungrounded neutral systems, the two-wire alternating-current circuit, the two-phase system, the three-phase, three-wire circuit and the specific considerations and wiring connections proved desirable by practical experience are offered.—*General Electric Review*, February, 1928.

*Electricity Meter Accuracy.*—G. L. E. Metz.—The ratio and phase-angle effects on the accuracy of watt-hour meters is developed in connection with the influences exerted by current transformers and a consideration of recent British specification standards. The author has considered the factors which influence the accuracy under operating conditions and under changes in phase angle. It is concluded that the errors cannot be reduced greatly in current transformers without increasing their size, while in the case of meters the difficulties in manufacturing procedures would be augmented if a higher degree of accuracy is required.—*Electrical Review (England)*, Feb. 17, 1928.

## *Transmission, Substations and Distribution*

*Steel-Cored Aluminum Conductors.*—E. T. Painton.—A general consideration of the application of steel-cored aluminum conductors to transmission line use, with particular reference to the results obtained in installations in Scotland. The economical and technical advantages as reflected in increased span length and resistance to corrosion have been considered by the author. As the result of severe tests, the suitability of this type of construction has been established by practical use. The methods found most desirable for erection purposes have been outlined.—*Electrician (England)*, Jan. 27, 1928.

*Mechanical and Electrical Properties of Conductors for 220-Kv. Lines.*—Avoidance of corona losses dictates that conductors to be used on 220-kv. lines shall have an outside diameter of about 1 in. Several types of conductors have been made available by wire and cable manufacturers to meet special conditions imposed by the 220-kv. conductor problem, and it is the purpose of this report of the overhead systems committee of the N.E.L.A. to present the physical, mechanical and electrical characteristics of a group of selected sizes of each type so that the designing engineer may have reliable data on a comparative basis. This report includes a discussion of corona loss and of tests for its determination. Tabulated results and characteristic curves indicating the properties investigated have been included and statements by manufacturers and research results are appended.—*Serial Report National Electric Light Association*, February, 1928.

## *Motors and Control*

*Synchronous Motor Drive With Dynamic Braking.*—C. E. Crease.—A new type of installation in which dynamic braking has been utilized to secure quick and uniform emergency or safety stopping of the synchronous motor used in a rubber mill is described in the article. The results are accomplished by disconnecting the motor stator from the alternating-current supply and connecting it across a resistance of suitable value while the rotor field circuit, by short circuiting the motor field rheostat, is increased to its maximum value. Full magnetic push-button control is utilized for this 300-hp. machine. — *Electrical News (Canada)*, Feb. 15, 1928.

## *Electrophysics, Electrochemistry and Batteries*

*Some Experimental Difficulties With the Electro-Magnetic Theory of Radiation.*—Arthur H. Compton.—It has become increasingly evident during the past few years that the classical electromagnetic theory of radiation is incapable of accounting for certain large classes of phenomena, especially those concerned with the interaction between radiation and matter, according to the author. The more serious difficulties which present themselves in connection with the theory that radiation consists of electro-magnetic waves propagated through space in accord with the demands of Maxwell's equations have been classified as the oscillatory source of the waves; the photo-electric effect; the scattering of X-rays, and of the recoil electrons; and the individual interactions between quanta of radiation and electrons. The author has considered the problems in detail and does not negate the concept of waves of radiation. He concludes, however, that energy is not transmitted by such waves. The power of the wave concept in problems of interference, refraction, etc., is stated to be well known, but whether the waves serve to guide the photons or whether there is some other relation between photons and waves remains an open question.—*Journal of the Franklin Institute*, February, 1928.

*The Adsorption of Gases by Solids.*—H. H. Lowry and P. S. Olmstead.—While many attempts have been made to develop a theory of adsorption of gases by solids which will allow quantitative prediction of the effect of changes in temperature and pressure on the quantity of gas adsorbed by a given adsorbent, none of the theories, with the possible exception of that of Polyani, according to the authors, may be said to be satisfactory. This is due to the fact that the mathematical relationships resulting from the various theories have all contained constants which cannot be directly determined. As a result there now exist many empirical equations which fit with equal satisfaction the data obtained either at constant temperature or at constant pressure, or with constant amount adsorbed. Polyani's theory, on the other hand, assumes that the force of attraction of the solid adsorbent for the gas molecules decreases with increasing adsorption according to the characteristics of the material, but is independent of temperature and can be determined from a single isotherm. The present investigation has been undertaken in an endeavor to amplify and co-ordinate the information now available and the theories involved regarding the adsorption of gases by solids.—*Reprint B-279 Bell Telephone Laboratories, Inc.*

## *Telegraphy, Telephony, Radio and Signals*

*Grid Current Modulation.*—Eugene Peterson and Clyde R. Keith.—The term grid current modulator as used by the authors refers to those vacuum tube circuits in which modulation is initially produced in the grid circuit of a three-electrode vacuum tube due to the non-linear grid current-grid voltage relation. Comparison with a representative plate current modulator using the same tubes and the same plate potential shows that by modulating at and using the plate circuit solely for maximum efficiency in the grid circuit amplification, the maximum power output is increased about eight times, the power efficiency is increased about five times and the ratio of side-band output to signal input is increased approximately three times. This improved performance has been made possible by a detailed study of the fundamental processes involved and by a design of the tubes and associated equipment, such as transformers and filters, to permit these fundamental processes to operate to their best advantage. The article concludes with an application of the principles involved to an experimental carrier-telephone system for which the operating features of tubes, filters and transformers are discussed.—*Bell System Technical Journal*, January, 1928.

*Power Plants for Telephone Offices.*—R. L. Young.—A brief discussion of some of the more important problems connected with the supplying of power to telephone offices and developments which are being perfected to bring about economies. The author has included consideration of the factors of commercial types of charging generators and appropriate filters, power factor correction, complete power unit assemblies for small installations and the development of more nearly automatically controlled power installations with the object of reducing supervision. The subject of battery reserve is also considered and the tendency exhibited in the design and application of the equipment discussed is indicated with a view toward future developments.—*Reprint B-276 Bell Telephone Laboratories, Inc.*

*A High Efficiency Receiver for a Horn-Type Loud-speaker of Large Power Capacity.*—E. C. Wente and A. L. Thuras.—A telephone receiver of the moving coil type which is particularly adaptable to the horn type loud-speaker and which is said to represent a notable advance over similar devices at present available is described by the authors. The design is such as to permit of a continuous electrical input of 30 watts, as contrasted with the largest capacity heretofore available of about 5 watts. In addition, measurements show that the receiver has a conversion efficiency from electrical to sound energy varying between 10 and 50 per cent in the frequency range of 60 to 7,500 cycles. This contrasts with an average efficiency of about 1 per cent for other loud-speakers, either of the horn or cone type. Combining the fifty-fold increase in efficiency with a fivefold or sixfold increase in power capacity, a single loud-speaker unit of the type here described is capable of 250 to 300 times the sound output of anything heretofore available.—*Journal of the Franklin Institute*, January, 1928.

## *Traction*

*Operating Costs of Industrial Trucks.*—C. B. Crockett and H. J. Payne.—All direct costs of handling materials by industrial trucks are influenced by operating conditions. Theoretical curves are presented showing the effect on the operating costs of different types of trucks resulting from variations in length of haul, amount of material to be handled, condition of runways and number and severity of ramps. In addition there are other conditions having a decided effect upon the cost of operation but which defy analytical treatment. The author lists these as width of runways and available space, fragility of material handled, special requirements in handling, labor market conditions and range of uses for which equipment is employed. The curves presented are not offered as accurate results of tests made nor are they true graphical representations of the formulas upon which they are based. They are rather a suggested method of approach to the problem of selecting the most economical equipment operating under given conditions. — *Iron Age*, Feb. 9, 1928.

## *Miscellaneous*

*Electricity on the Farm.*—The material presented in this bulletin represents a summary of available information by the Committee on the Relation of Electricity to Agriculture regarding the rural uses for electricity. It is stated to be offered not as the last word upon the subject but rather as an elementary treatise of a development which promises to grow with astounding rapidity. The energy requirements for cooking have been tabulated for farms in various localities, with certain minimum numbers of family members, and have been reduced to average values. Appliance factors as well as those concerned in the laundry, household refrigeration, farm refrigeration, water supply, radio application and miscellaneous uses are offered. Wiring installation costs and recommendations for adequate, safe and satisfactory service are included. The recent developments of insect destroyers of various kinds, the thermal requirements for incubating and breeding purposes, and the demonstrated usefulness of ultra-violet and incandescent lighting in poultry raising receive authoritative treatment in this comprehensive summary of rural applications. — *Bulletin Vol. 4, No. 1, Committee on the Relation of Electricity to Agriculture.*

# News of the Industry

## St. Francis Dam Goes Out

### Failure of Los Angeles Municipal Structure in San Francisquito Canyon Causes Heavy Loss of Life and Property—Power House No. 2 Demolished

ANOTHER flood disaster affecting electric light and power service has been added inside a twelvemonth to those on the Mississippi and its tributaries and in the New England States. This time the scene shifted to a third geographical district, southern California, and the failure of man's handiwork rather than the uncontrolled operation of natural forces is the cause to which, in the absence of any evidence of earthquake or dynamiting, the torrent must be ascribed.

It is estimated that from 300 to 400 lives were lost and that damage to property reaching $15,000,000 was done when the St. Francis Dam on the aqueduct of the city of Los Angeles, which stood in San Francisquito Canyon, 40 miles north of the city, failed at 11:58 p.m. on March 12. Approximately 38,000 acre-feet of water was impounded by the dam, all of which escaped. The wall of water, which is said to have been fifteen feet high, swept aside every structure in the canyon and flooded Santa Clara Valley.

According to H. A. Van Norman, assistant chief engineer of the Los Angeles Water and Power Department, this is the explanation of the breaking of the dam: "Both sides of the dam gave out at the sides. The water saturated the ground deep into the hills at either side and this ground gave way first at the west side of the dam. When the ground gave way at the west side it weakened the concrete structure of the dam itself, and it sheared out completely on that side. Then the east side gave out in a similar manner. The remarkable thing is that the center arch on the dam, 75 ft. wide and 208 ft. high, is still standing."

The city had two plants in San Francisquito Canyon—No. 1, above the St. Francis Dam, with a capacity of 40,600 kw., and No. 2, immediately below it, with a capacity of 52,500 kw. Reports declare that the lower plant has been completely demolished and that all the operators and families to the total of 64 lost their lives. The Southern California Edison Company took over the load of the bureau when the city lines went out and is without difficulty meeting the demands for energy throughout the system.

It is estimated that the damage to the properties of the Bureau of Power and Light will be in excess of $5,000,000, and general property damage is estimated at $10,000,000 in addition.

A camp belonging to the Southern California Edison Company which had been established in the valley, in the path of the flood, was swept away, and it is believed that 40 or more of the 170 transmission-line workers housed there lost their lives. The roar of the breaking dam and flashes from broken power lines were the first signals of danger to the inhabitants of the valley, most of whom were asleep. By daylight the torrent had reached the Santa Clara, more than 20 miles from the dam. The river, normally a dry bed, was running fifty feet deep and two miles wide, sweeping away everything in its path. In another hour or two the stream had dissipated its force at Ventura and left a comparatively quiet flow of about six feet. Then this too trickled away, leaving only deep pools.

From Saugus on the east to near Oxnard on the west, a stretch of 40 miles, every power and telegraph wire was down, all bridges were out, highways were buried under many feet of mud or torn away by the force of the flood, and twisted snarls of railroad track lay far from the right-of-way, the sleepers still clinging at odd angles to the rails.

R. H. Ballard, vice-president and general manager Southern California Edison Company, sent the following telegram to the ELECTRICAL WORLD on Wednesday:

"We are operating normally and in addition easily carrying the full load of the municipal power system, which is completely shut down. Our only loss was a few towers standing in the path of the flood and a small switching station, and we were able to pick up the

*St. Francis dam and reservoir before the break—Finished May, 1926*

Los Angeles load of the municipal system within a few minutes after its stations shut down and to establish new connections for Santa Barbara and Ventura Counties within a few hours. One of our transmission-line construction camps was located about twenty miles below the municipal dam and in the path of the flood. We have suffered some loss of life to employees—so far about eight known casualties with a number still missing."

A later dispatch says that on Tuesday night the Edison plants carried a peak of 628,000 hp., the highest in the history of the company. On the corresponding day of last week the peak was 532,000 hp., and the highest previous peak on record was 598,000 hp. Except for local disturbances in the flooded area, there has been no interruption to the service of the Southern California Edison Company. The monetary loss to that company will be less than $100,000, represented by damage to eight high-tension-line towers, a group of small cottages and a bank of oil switches which were in the path of the flood. The Long Beach steam plant was an important factor in meeting the emergency.

### Description of the Dam

Dimensions and other details of construction of the St. Francis Dam are listed in a report by W. W. Hurlbut, office engineer of the Bureau of Water Works and Supply, Los Angeles, dated July 1, 1926. It describes the dam as follows:

"The St. Francis Dam was completed May 4 and contains 167,000 cu.yd. of concrete, of which 94,000 cu.yd. was placed during this fiscal year. The maximum height of the dam is 208 ft. The maximum width is 169 ft. and the length is 668 ft. with an additional length of dike of 613 ft. The design of the dam is the gravity type arched for additional safety."

State and local officials are at a loss to find a reason for the sudden collapse, and searching investigations are to be launched at once. Edward Hyatt Jr., State Engineer, said:

"According to our reports, the dam was in perfect condition and had been inspected regularly under state supervision. It does not seem likely that it could have been dynamited, as a tremendous quantity of explosives would have been necessary. We expect to go to the bottom of the affair."

## Dam in Kickapoo Fails

An ice jam in the Kickapoo River carried out a 60-ft. dam at La Farge, Wis., on Tuesday, interrupting the service of the local isolated electric plant, which supplies 800 inhabitants. This is the second serious interruption in recent years. Service will probably be resumed by arrangement with a nearby transmission system. As a result of the accident highways became impassable in all directions, a passenger train was marooned in the village and farms were flooded.

# Norris Bill Gets Through Senate

## By 48 to 25 It Is Passed Without the Harrison Amendment—House Expected to Disagree—First Session of Power Investigation—House Committee Is for Boulder Dam

By Paul Wooton

*Washington Correspondent of* Electrical World

BY A VOTE of 48 to 25 the Senate on Tuesday, March 13, after a debate lasting three weeks, adopted the Norris joint resolution providing for federal operation of the government's plants at Muscle Shoals. Under the resolution, the money derived from the sale of hydro-electric power will be used for experimentation in the manufacture of fertilizers.

Amendment after amendment was rejected by the Senate, the most important being the "Underwood" plan submitted by Senator Harrison of Mississippi, proposing a 50-year lease to private interests with the stipulation that 40,000 tons of fertilizer must be produced annually. This was defeated by a vote of 48 to 26.

Senator Sackett of Kentucky presented a plan to lease the plant to private interests. He said his amendment was identical with the Norris scheme except in the main issue of private versus government operation. This amendment was lost on a *viva voce* vote.

On the final vote twenty Republicans, twenty-seven Democrats and the lone Farmer-Labor member voted for the resolution, fifteen Republicans and ten Democrats casting their ballots against government operation. The resolution now goes to the House military committee, which will probably hold hearings upon it. The consensus of opinion is that no agreement between the two houses will be reached at this session of Congress.

Advocates of government ownership are acclaiming the Senate's passage of the Norris Muscle Shoals resolution as a great victory for the principles for which they stand. If the House can be influenced to follow the example of the Senate, they see the beginning of the Tennessee Hydro-Electric Commission, modeled along the lines of the Ontario Hydro-Electric Power Commission. At the beginning of the debate Senator Norris frankly announced that one of the purposes of his resolution was to demonstrate the advantages of government operation of power plants. Not only does the government by the terms of this resolution enter into the business of generating and selling power, with preferences to municipalities and farmers' organizations, but the resolution sets up the Federal Power Commission as the agency to regulate the rates to be paid for this power within the states. That particular part of the resolution, Senator Tydings of Maryland told the Senate, is unconstitutional.

It also is recognized that the passage of the Norris resolution greatly strengthens the hands of the supporters of the Swing-Johnson Boulder Canyon bill. The Senate's indorsement of government operation at Muscle Shoals is regarded as paving the way for a similar effort on the St. Lawrence and on other streams where large power resources are available. The hope of those who are opposed to government in business is that the House, which has become the conservative branch of Congress, may insist upon the elimination of the government operation feature of the resolution. The requirement to operate plant No. 2 also will be opposed strenuously in the House. Some are of the opinion that the effort on the part of the government to operate that type of plant, which many regard as obsolete, is foredoomed to failure and is likely to result in a reaction against any use of Muscle Shoals for fertilizer production.

The fact that only twenty-five Senators voted against the resolution came as a surprise, but is accounted for by the consideration that such a vote would be interpreted as an attempt to prevent the use of Muscle Shoals for fertilizer purposes. In addition, so much has been said about cheap electric rates in Ontario and at publicly operated plants that the impression was created that existing domestic rates are too high. Some of the Senators who had voted against the Walsh resolution are thought to have seized this opportunity to demonstrate that they are not always on the same side as the power companies.

### Committee Indorses Boulder Dam

A report recommending the passage of the Swing-Johnson Boulder Canyon bill was submmitted to the House of Representatives on March 15 by its committee on irrigation and reclamation. It was concurred in by all members of the committee except Representatives Douglas of Arizona, Winter of Wyoming and Leatherwood of Utah. They expect to submit minority reports, and Mr. Douglas has already seized on the St. Francis Dam disaster to ask, through a press release, whether the far greater dam in Boulder Canyon might not prove a menace instead of a protection to the Imperial Valley. Representative Davenport of New York submitted additional views, disagreeing in part with the majority. The conclusions of the majority of the members of the committee follow:

This bill should be passed because

First—Congress should no longer risk a flood catastrophe to Imperial Valley—a catastrophe which further delay only courts.

Second—Reclamation possibilities in the lower basin should be safeguarded and taken care of before it is too late. Unless something is done, the river will be acquired for power development exclusively. Mexico is constantly building up added claims to its waters.

Third—The Mexican situation must be met. It is not sound policy to allow a condition to continue by which that country may and will go on using more and more water from the river, and this at the expense of existing and future irrigation in the United States.

Fourth—The government should aid its people to secure their necessities in the way of domestic water supply, where it can do so, as here, without cost and as an incident in carrying out other federal purposes such as river regulation and reclamation.

Fifth—It will convert a natural menace into a national asset.

Sixth—A financial scheme is presented by which the development will be completely prefinanced, thus fully protecting the federal treasury and the general taxpayer.

Seventh—It settles in large part water rights between states in a sensible and practical way, substituting interstate agreements for interminable litigation and controversy. Further delay points to the latter untoward results and the disintegration of the plan of settling water rights by interstate compact.

### N.E.L.A. Men Are Witnesses

A large amount of testimony in the form of documents was introduced at the first public hearing of the Federal Trade Commission's investigation of public utilities on Thursday, March 8. Commissioner Edgar A. McCulloch presided. Representatives of the National Electric Light Association and the American Gas Association were examined. Further public hearings will, the commission informs the Senate in its first report, made on March 15, be held as fast as adequate preparation for them can be made.

To meet the situation presented on the Colorado, St. Lawrence, Columbia and Tennessee Rivers, where development plans may originate with the government, a set of principles which should govern the relationship between the government and the utilities has been proposed by J. T. Newcomb, counsel for the Joint Committee of National Utility Associations. In an address made on March 5 before members of the Cosmos Club in Washington, Mr. Newcomb said, in part:

1. No such projects should be undertaken unless they are clearly and primarily entered upon in the fulfillment of federal government purposes. This, it seems to me, must be a fundamental requirement, although it is true that in performing such functions the government will frequently find itself necessarily involved in incidental activities of a different character.

2. The right to use the water should be disposed of by the government at its fair value. It should not be sold for less than its value, because neither power users nor anybody else should be made the special beneficiaries of government expenditures by getting water or power at less than its value. On the other hand, the power users should not, through coercion or otherwise, be compelled to pay more than the fair value for the right to use the water, because to do so would make them a class specially taxed for the construction of a public improvement.

3. In addition, it seems to me that the legislation should specifically promote by definite and certain terms co-operation with the existing power producers, whose plans reach far into the future. This requires, of course, a clearly announced policy on the part of the government, firmly adhered to, which can be depended upon by the private companies.

## Savings-Bank Investment Bill Prospects Good

*Both Houses Pass It, and It Awaits Governor's Action — Governor's Water-Power Measure Gets Its Quietus in Upper House*

THE bill introduced by the committee on banks authorizing the investment by savings banks in the bonds of certain electric, gas and telephone corporations passed the New York Assembly on Thursday without debate by a vote of 130 with no opposition. This bill previously passed the Senate. It now goes to the Governor for executive approval. The Assembly also passed and sent to the Governor the bill authorizing savings banks to invest in bonds and obligations of railroad corporations. The expected opposition to the savings-bank investment bills failed to develop in the Lower House, the Republicans having approved of their passage in caucus.

In the Senate opposition was led by Minority Leader Downing. There the bill relating to utility bonds was passed by 33 to 15. All of the opposition came from Democratic Senators from New York City.

Following the example of the Assembly, the Senate by a party vote defeated the Governor's bill to set up a Water Power Authority, the Republicans offering to send to him again their bill of last year creating another committee to study development proposals. The Sargent water-power bills, protecting the interests of the state in the river regulating districts, tentatively approved by the Governor, are understood to be slated for passage.

Governor Smith has approved two minor water-power bills passed by the Legislature. One is designed to prohibit any water-power development projects in the Adirondacks where the altitude is more than 1,500 ft. This is to protect Saranac Lake, Lake Placid and other mountain resorts. The other measure would have a commission of three named to determine a fair return to the state for land flooded in connection with water-power projects along the inland streams.

## Radio Adjustment Now Awaits Conference
